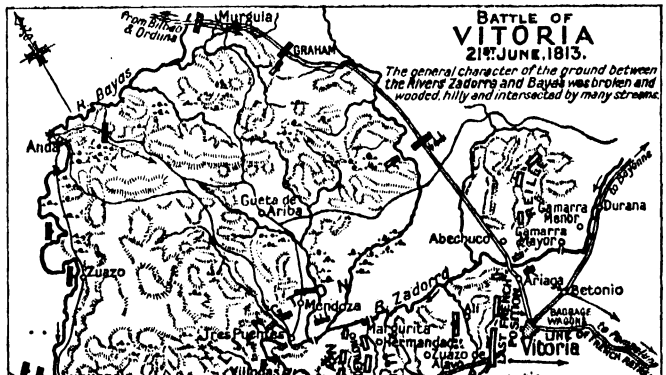
VITERBO, a provincial capital and episcopal see of the district of Lazio (Latium), Italy, 54 m. by rail N.N.W. of Rome, 1,073 ft. above sea-level. Pop. (1921) 20,471 (town), 25,352 (commune). A line (25 m.) runs north-east to Attigliano, on the railway from Rome to Florence. It is picturesquely surrounded by luxuriant gardens, and enclosed by walls and towers, which date partly from the Lombard period. The streets are paved with large lava blocks, of which the town is also built. The Piazza S. Pellegrino is said to be the best example in the country of a 13th century piazza. The citadel (Rocca) itself, erected by Cardinal Albornoz in 1345, is now a barrack.

The cathedral, a fine basilica, of the 12th (?) century, with columns and fantastic capitals of the period, originally flat-roofed and later vaulted, with 16th-century restorations, contains the tomb of Pope John XXI., and has a Gothic campanile in black and white stone. Here Pope Adrian IV. (Nicholas Breakspear) compelled the emperor Frederick I. to hold his stirrup as his vassal. The old episcopal palace with a double loggia built on to it (recently restored to its original form) is a Gothic building of the 13th century. The church of S. Rosa exhibits the embalmed body of that saint, a native of Viterbo, who died in her eighteenth year, after working various miracles and having distinguished herself by her invectives against Frederick II. (1251), some ruins of whose palace, destroyed after his death, exist. S. Francesco, a Gothic church (1236), contains the fine Gothic tombs of Popes Clement IV. and Adrian V., and has an external pulpit of the 15th century. S. Maria della Cella is noteworthy for one of the earliest campanili in Italy (9th century). The town hall, with a mediaeval tower and a 15th-century portico, contains some Etruscan sarcophagi and a few paintings. Close by is the elegant Gothic façade of S. Maria della Salute, in white and red marble with sculptures. The Gothic cloisters of S. Maria in Gradi and of S. Maria della Verità just outside the town are strikingly beautiful. The latter church contains frescoes by Lorenzo da Viterbo (1469) and an interesting museum.



Viterbo is by some identified with *Surrina nova,* which is only mentioned in inscriptions, while some place this to the west of Viterbo on the line of the Via Cassia, which was joined here by the Via Ciminia, passing east of the Lacus Ciminius, while a road branched off to Ferentum. (*See,* however, MONTEFIASCONE.) It is not an unlikely assumption that here, as elsewhere, the mediaeval town occupies an Etruscan site. It was fortified by the Lombard king Desiderius. It is the centre of the territory of the "patrimony of Peter," which the countess Matilda of Tuscany gave to the papal see in the 12th century; in the 13th century it became a favourite papal residence. (T. A.)

VITOLS, JOSEPH (1863–), professor, Latvian composer and musician. For the last 30 years Vitols has played a large part in the musical life of Latvia. Although he studied and lived for a long time in St. Petersburg (from 1886–1918) as professor of the composition classes of the local conservatory, he has always shown a very special interest in his native country. Already, during the summer of 1918, before the proclamation of

Latvia's independence, Vitols came back and took over the administration of the Lettish opera. A year later (1919) he was given the office of rector of the musical conservatory of Riga, but still continued the supervision of the theory and composition classes. Besides his creative and teaching work Vitols has held, both in Russia and Latvia, numerous posts where he has been able to make full use of his great musical ability. He has been member of the prize distributing committee, president of several musical committees in the Ministry of Education, musical critic, etc. He is director of the Latvian State Music Conservatory.

VITORIA, an episcopal city of northern Spain, and capital of the province of Álava; on the Miranda de Ebro-Alsasua section of the Northern railways, among the southern outliers of the Cantabrian mountains, and on the left bank of the river Zadorra, a left-hand tributary of the Ebro. Pop. (1920) 34,785. Vitoria was founded in 581 by Leovigild, king of the Visigoths; but its importance dates from the 10th century. In 1181 Sancho the Wise of Navarre granted it a charter and fortified it. The city is built on a hill 1,750 ft. high, and overlooks the plain of Álava. The cathedral of Santa Maria dates from 1181, but has been considerably spoiled by late additions: the church of San Miguel also dates from the 12th century; it has a beautiful altar, carved in wood by J. Velazquez and G. Hernandez, in the 16th century. Vitoria, from its favourable position on the main lines from Madrid to France and to the port of San Sebastian, is an important centre of trade in wine, wool, horses, mules and hardware.

Battle of Vitoria.—For the operations which preceded the battle of Vitoria *see* PENINSULAR WAR. On June 21, 1813, the French army in Spain (about 65,000 men with 150 guns), under King Joseph Bonaparte, held an extended position in the basin of Vitoria, south (with the exception of the extreme right) of the river Zadorra. The left rested on the heights of Puebla, north of the Puebla Pass, and Puebla de Arganzon, through which ran the Miranda-Vitoria-Bayonne road, Joseph's line of communication with France. Thence the line stretched to the ridge of Margarita, the troops so far being under General Gazan, with a second supporting line under D'Erlon between Arinez and Hermandad

and a reserve behind Arinez. The right under Reille guarded the Bilbao-Vitoria road.

There were no troops between Hermandad and Ariaga, except a mass of cavalry near Ali. The Zadorra, fordable in certain spots only, was spanned by bridges at Puebla de Arganzon, Nanclares, Villodas, Tres Puentes, Mendoza, Abechuco and Gamarra Mayor, which French guns commanded; but, for some reason, none of these had been destroyed. The faults of the French position and their occupation of it were its extension; that it was in prolongation of and (on the right especially) very close to their line of retreat, so that if the right were driven back this line could be at once seized; that the centre was not strongly held; and that all bridges were left intact.

The Allies (nearly 80,000, with 90 guns), under Wellington, had moved from the river Bayas at daylight to attack Joseph, in four columns, the right being under Hill (20,000, including Morillos's Spaniards), the right centre and left centre under Wellington (30,000) and the left under Graham (20,000, including Longa's Spaniards). As the columns marched across the intersected country between the Bayas and Zadorra, extending from near Puebla de Arganzon to the Bilbao-Vitoria road, they kept touch with each other; and as they neared the Zadorra the battle opened all along the line soon after 10 A.M. Wellington's instructions to Graham were to undertake no manoeuvre which would separate his column from those on the right; but, with this proviso, to seize the Vitoria-Bayonne road if the enemy appeared decidedly in retreat. Hill after a sharp contest gained the Puebla heights, too weakly held; and pushing through the pass carried the village of Subijana de Álava. The right centre column having reached Villodas, was waiting for Hill to gain further ground, when the bridge at Tres Puentes was observed to be unguarded, probably because it was commanded from the south bank; and, the French attention being now turned towards their flanks, it was surprised and rushed by Wellington with the Light division, supported quickly by cavalry and other troops, who maintained themselves on the south bank. Joseph's centre was partially forced, while his left was hard pressed by Hill; and, fearing that Gazan and D'Erlon might be cut off from Reille, he ordered them to withdraw to a ridge farther back, which they did, holding Arinez in front. Here there was no hard fighting; but, as Wellington had now passed three divisions, many guns and the cavalry (which, however, from the nature of the ground could be but little used) across the Zadorra, Margarita, Hermandad and Arinez soon fell to the Allies.

On the left, Graham, having turned the heights north of the Zadorra with Longa's Spaniards, seized Gamarra Menor close to the Bayonne road. He also with heavy loss carried Gamarra Mayor and Abechuco, but the bridges south of these villages, though more than once taken, were always recaptured by Reille. At length, when a brigade from the Allied centre had been pushed up from Hermandad against Reille's flank, he withdrew from the obstinately defended bridges, and before this Gazan and D'Erlon had also fallen back, fighting, to a third position on a ridge between Armentia and Ali west of Vitoria. Here, at about 6 P.M., they made a last stand, being compelled in the end to yield; and as Graham, having now crossed the bridges, was close to the Bayonne road, the main body of Joseph's army fled by a bad cross-road towards Pampeluna, abandoning artillery, vehicles and baggage (of which an enormous quantity was parked near Vitoria), Reille afterwards joining it through Betonia. The Allies then occupied Vitoria and pursued the French until nightfall. All Joseph's equipages, ammunition and stores, 143 guns, a million sterling in money, and various trophies fell into Wellington's hands, the French loss in men being nearly 7,000, that of the Allies over 5,000, of whom 1,600 were Portuguese and Spaniards. This decisive victory practically freed Spain from French domination. (C. W. Ro.)

VITRÉ, a town of north-western France, in the department of Ille-et-Vilaine, on a hill above the left bank of the Vilaine, 24 m. E. of Rennes by rail. Pop. (1926) 6,584. Vitré belonged in the 10th century to the younger branch of the counts of Rennes. In 1295 it passed to Guy IX., baron of Laval, on his marriage with the heiress, and afterwards successively belonged to the families of Rieux, Coligny and La Trémoille. It was seized by Charles VIII. in 1488. Protestantism spread under the rule of the houses of Rieux and Coligny; Vitré became a Huguenot stronghold; and a Protestant church was established, which was suppressed at the revocation of the edict of Nantes in 1685. The estates of Brittany, over which the barons of Vitré and of Léon alternately presided, met here several times. The town largely retains its mediaeval aspect. The ramparts on the north side and on the west, consisting of a machicolated wall with towers at intervals, are still standing. Only one gateway remains of the original 11th century castle; the rest was rebuilt in the 14th and

15th centuries and restored in recent times.

VITRIFIED FORTS, the name given to certain hill-forts of which the defences consist entirely or to some extent of walls which have been subjected in a greater or less degree to the action of fire. Their form is determined by the contour of the summits which they enclose and generally the plan is simple. The walls vary in size, the vitrified portion being usually confined to a core extending from the top downwards, though vitrifaction has been met with on the sides of the wall only, and in one known instance a narrow wall consolidated by vitrifaction was found in the heart of an earthen rampart. As a rule the vitrified mass appears to have been supported by a wall of unvitrified stone built up on one or both faces. No lime or cement has been found in any of these structures, all of them presenting the peculiarity of being consolidated to a greater or less extent by the fusion of the rocks of which they are built. This fusion, caused by the application of intense heat, is not equally complete in the various forts, or even in the walls of the same fort. In some cases the stones are only partially melted and calcined; in others their adjoining edges are fused so that they are firmly cemented together. In many instances pieces of rock are enveloped in a glassy enamel-like coating which binds them into a uniform whole; and at times, though rarely, the entire length of the wall presents one solid mass of vitreous substance.

Some 50 examples have been discovered in Scotland widely distributed. They are also found in Ireland, Lusatia, Bohemia, Silesia, Saxony and Thuringia; in the provinces on the Rhine, especially in the neighbourhood of the Nahe; in the Ucker Lake, in Brandenburg, where the walls are formed of burnt and smelted bricks; in Hungary; and in several places in France. They have not been found in England or Wales.

The following facts may be noted:—(1) The idea of strengthening walls by means of fire is not singular, or confined to a distinct race or area, as is proved by the burnt-earth enclosure of Aztalan, in Wisconsin, and the vitrified stone monuments of the Mississippi valley. (2) Many of the Primary rocks, particularly the schists, gneisses and traps, which contain large quantities of potash and soda, can be readily fused in the open air by means of wood fires—the alkali of the wood serving in some measure as a flux. (3) The walls are chiefly vitrified at the weakest points, the naturally inaccessible parts being unvitrified. (4) When the forts have been placed on materials practically infusible, as on the quartzose conglomerates of the old red sandstone, as at Craig Phadraic, and on the limestones of Dun Mac Uisneachain, pieces of fusible rocks have been selected and carried to the top from a considerable distance. (5) Many of the continental forts are so constructed that the fire must have been applied internally, and at the time when the structure was being erected. (6) Daubrée, in an analysis of vitrified materials taken from four Fren ' forts, which he submitted to the Academy of Paris in Feb. 1881, found the presence of natron in such abundance that he inferred that sea-salt was used to facilitate fusion. (7) In Scandinavia, where there are hundreds of ordinary forts, and where for centuries a system of signal fires was enforced by law, no trace of vitrifaction has yet been detected.

VITRIOL, a name given to sulphuric acid and to certain sulphates. Oil of vitriol is concentrated sulphuric acid, C.O.V. and B.O.V. being abbreviations for "commercial" and "brown" oil of vitriol, respectively. Blue or Roman vitriol is copper sulphate; green vitriol, ferrous sulphate (copperas); white vitriol, zinc sulphate; and vitriol of Mars is a basic iron sulphate.

VITRUVIUS (MARCUS VITRUVIUS POLLIO), Roman architect and engineer, author of a celebrated work on architecture. Nothing is known of him except what can be gathered from his writings. Owing to the discovery of inscriptions relating to the *gens* Vitruvia at Formiae in Campania (Mola di Gaeta), it has been suggested that he was a native of that city, and he has been less reasonably connected with Verona on the strength of an arch of the 3rd century, which is inscribed with the name of a later architect of the same family name—"Lucius Vitruvius Cerdo, a freedman of Lucius." Vitruvius himself says that he was appointed, in the reign of Augustus, a superintendent of *balistae* and other military engines (*De Architectura,* i. pref.). In another passage (v. 1) he describes a basilica and adjacent *aedes Augusti,* of which he was the architect. To a great extent the theoretical and historical parts of his work are compiled from earlier Greek authors, of whom he gives a list at i. 1 and viii. 3. The practical portions are evidently the result of his own professional experience, and are written with much sagacity, and in a far clearer style. Vitruvius's name is mentioned by Frontinus in his work on the aqueducts of Rome; and most of what Pliny says (*Hist. Nat.* xxxv. and xxxvi.) about methods of wall-painting and practical details in building is taken from Vitruvius, though without any acknowledgment.

The treatise *De Architectura Libri Decem* is dedicated to Augustus. Lost for a long time, it was rediscovered in the 15th century at St. Gall; the oldest existing ms. dates from the 10th century. Throughout the period of the classical revival Vitruvius was the chief authority studied by architects, and in every point his precepts were accepted as final. Bramante, Michelangelo, Palladio, Vignola and earlier architects were careful students of the work of Vitruvius.

The best edition of the *De Architectura* is by Rose (2nd ed., Leipzig, 1899); *see* also Nohl, *Index Vitruvianus* (1876); Jolles, *Vitruvs Aesthetik* (1906); Sontheimer, *Vitruv und seine Zeit* (1908). For translations, *see* that by Gwilt (1826; reprinted 1874); and by M. H. Morgan, with illustrations (Cambridge, U.S.A., 1914).

VITRY-LE-FRANÇOIS, a town of north-eastern France, capital of an arrondissement in the department of Marne, on the right bank of the Marne, 20 m. S.E. of Châlons, on the railway from Paris to Strasbourg. Pop. (1926) 8,314. The Marne-Rhine canal, the Haute-Marne canal, and the lateral canal of the Marne unite at Vitry. The present town was built in 1545 on a uniform plan by Francis I. to replace the older one of Vitry-en-Perthois, 2½ m. to the north-east, burned in the previous year by Charles V. During the early weeks of the World War Joffre had his headquarters at Vitry-le-François, and it was taken and retaken in the battle of the Marne (1914).

VITTEL, a watering-place of north-eastern France, in the department of Vosges, 31 m. W. of Epinal by rail. Pop. (1926) 2,693. The cold saline and chalybeate waters are bottled and exported in large quantities. They are prescribed in cases of arthritis, dyspepsia, etc. Vittel is a fashionable resort.

VITTORIA, a town of Sicily in the province of Ragusa, 95 m. W.S.W. of Syracuse by rail (42 m. direct), founded in the 17th century. It is a prosperous town in the centre of a fertile district, with the largest wine trade in Sicily. Pop. (1921) 31,249 (town), 31,997 (commune).

VITTORIO VENETO, a town and episcopal residence of the province of Treviso, Venetia, Italy, 25 m. by rail N. of Treviso, 466 ft. above sea-level. Pop. (1921) 16,162 (town), 24,400 (commune). It is a summer resort, with sulphur and saline springs (51·8° to 59° F), and was formed in 1879 by the union of Ceneda (the episcopal see) and Serravalle. The cathedral contains paintings by Pomponio Amalteo (a pupil of Pordenone) and Tiepolo. At Serravalle is a church with a fine altar-piece (1547) by Titian and a number of Gothic and Renaissance houses. It is a seat of the silkworm breeding and silk-throwing industries. To the north are important hydroelectric plants.

VITTORIO VENETO, BATTLE OF. This is the title given to the battle or, more truly, campaign in which the Austrian forces on the Italian front were finally overthrown in Oct. 1918. Diaz's plan for the bigger offensive finally decided upon was to concentrate on the Piave front between Pederobba and Fagaré (east of Treviso), to cross the river and break through by way of Conegliano to Vittorio Veneto, dividing the Austrian V. and VI. Armies which held the river line from the sea to Valdobbiadene. The attack was fixed for Oct. 16, but bad weather and a rise of the Piave caused a delay.

Italian Plans.—It was decided to open the action with an attack by the IV. Army (nine divisions) in the Grappa sector, with the double object of drawing the enemy reserves from the Feltre sector and of breaking through in this direction. The attack on the Piave was to be carried out by three armies, the XII., VIII. and X., of which the first and last had been formed specially for this offensive. The XII. Army (one French division and three Italian) was commanded by Gen. Graziani, the commander of the French troops in Italy; and the X. Army (two British divisions and two Italian) by Lord Cavan.

The main drive was to be made by the VIII. Army (14 divisions), attacking from below Pederobba to Ponte della Priula. The XII. Army was to advance northward outside the Piave, while the X. Army was to attack the right wing of the Austrian V. Army and form "a defensive flank to cover and protect the principal manoeuvre of the VIII. Army" (Gen. Diaz's report). On the battle front from the Brenta to Fagaré were massed 41 divisions, 22 in line and 19 in reserve. Against this force the Austrians had 23 divisions in line and immediate reserve, and 10 more divisions within reach. The Piave-Grappa front was divided between two army groups: Boroević's Piave Group (V. and VI. Armies), from the sea to Valdobbiadene, and the newly formed Belluno Group, under Gen. Goglia, from Valdobbiadene to the Brenta. The disposition of the Austrian troops and guns showed a fear for the Grappa positions and a failure to divine the direction of the main Italian attack. In the Grappa sector the Belluno Group had eight divisions in line and three in immediate reserve, while the infantry was backed by some 1,200 guns. The Austrian VI. Army, on the other hand, with seven divisions in line and two in support, had only about 500 guns against a mass of over 2,000. Opposite Lord Cavan's X. Army the right wing of the Austrian V. Army had three divisions in line and one in support.

Allied Attack Opens.—The Italian IV. Army, under Gen. Giardino, attacked at dawn on Oct. 24, and though some headway was made the enemy put up a very stubborn resistance. Already a very fine piece of work had been carried out by British troops of the X. Army, who in the early hours of the same day occupied the northern part of the long shoal island of the Grave di Popodopoli, crossing the main channel in small flat-bottomed boats punted by Italian specialist troops (*pontieri*), and driving back or capturing the enemy outposts. The general attack should have followed the next night, but a sudden rise in the river, which was coming down in heavy flood at 7m. an hour, counselled delay. It was not until the night of Oct. 26, when the southern part of the Grave di Popodopoli had also been occupied by Italian troops of the X. Army, that the bridges began to be thrown across the river for the main attack.

The Crossing of the Piave.—Eleven crossing points were selected, one at Pederobba for the right wing of the XII. Army, seven on the VIII. Army front, and three for the X. Army, at the Grave di Popodopoli. The XII. and X. Armies threw their bridges successfully, but on the VIII. Army front only two of the seven sets of bridges could be established, both on the north of the Montello. Next day three bridgeheads were established: opposite Pederobba, north of the Montello, and opposite the Grave di Popodopoli. The most important advance was made in the latter sector, where the X. Army succeeded in advancing to a depth of over 2m. on a front of about 4m. The British XIV. Corps took 3,500 prisoners and 2,100 were captured by the Italian VI. Corps.

This was the most successful advance of the day. The bridges of the VIII. and XII. Armies were all destroyed during the day. At Pederobba some headway was made, and the troops of the VIII. Army, who attacked towards Sernaglia, gained about a mile. But the right wing of the Army (VIII. Corps) was unable to throw its bridges, and only a detachment of storm-troops reached the left bank. There was a gap of some 6m. between the left wing of the VIII. Army and the British XIV. Corps, which formed the left wing of the X. Army, and the chief move in the general manoeuvre was checked. The VIII. Corps had been detailed to push straight for Vittorio Veneto, and the fact that it had been unable even to start its advance threatened to throw the whole battle out of gear.

No better fortune attended the efforts made on the following night to bridge the river east of the Montello. The swift current and the enemy guns defied all attempts to establish the bridges, and the engineers suffered very heavy casualties. In spite of the initial successes, the situation was unsatisfactory, but after the first failure to cross the river east of the Montello, Gen. Caviglia, who commanded the VIII. Army and had the general direction of the attack, had detached the XVIII. Corps from his reserves to pass under the command of Lord Cavan, cross by the X. Army bridges, push north and clear the front of the troops who were held up. The move was entirely successful. The XVIII. Corps under Gen. Basso crossed the river in the early hours of Oct. 28 and attacked northward, while the rest of the X. Army continued its advance.

Position on Oct. 29.—At the close of Oct. 28 the XVIII. Corps had gained nearly 4m. and had crossed the railway north of the Priula bridges. The British XIV. Corps had gone right through the Austrian positions and had patrols out on the Monticano, while the Italian XI. Corps was threatening the enemy troops on the Lower Piave. The bridgehead was 10m. wide and 4m. deep. The XII. Army and the left wing of the VIII. had also made good progress, and at last the VIII. Corps was crossing the river, between Nervesa and Ponte di Priula. The prospects of the following day were bright, for the separation of the Austrian V. and VI. Armies was effected; and the VI. Army, heavily attacked in front, was seriously threatened on its left by Basso's XVIII. Corps.

On the evening of Oct. 29 an Italian flying column entered the town of Vittorio Veneto. The attacking armies had already taken 33,000 prisoners, and the situation of the Austrian troops on the Piave was hopeless. Next day resistance broke down, and the general retirement ordered on the 29th became a complete rout. The troops on Monte Grappa had hitherto held firm against the repeated attacks of the IV. Army, and had made many counter-attacks. But here too, on the night of Oct. 30, a retreat began that was to turn into a flight.

Austrian Collapse and Armistice.—Late on the evening of Oct. 30 the Austrian command announced that in view of the discussions regarding an armistice which were being conducted between Germany and the United States, "our troops fighting on Italian soil will evacuate the occupied region." On the same day the order for a general retreat was given, and that evening, in the Val Lagarina, Gen. Weber von Webernau, commander of the Austrian VI. Corps, made a formal demand for an armistice. Next day he and his staff were taken to the Villa Giusti, near Padua, and discussions were begun. It was, of course, necessary to communicate with Versailles, where the Allied War Council was discussing a reply to Germany's demand for an armistice.

Meanwhile the fighting continued, and the Austrian armies crumbled away. The Italian VI. and I. Armies attacked in the Trentino, and the III. Army, which had crossed the Piave two days before, was already taking part in the pursuit of Boroević's broken divisions. On the night of Nov. 2–3, although the Armistice was not yet signed, the Austrian command issued an order for the cessation of hostilities. It was at first revoked by the Emperor Charles, but was reissued and reached the front on the morning of Nov. 3. The terms were only agreed on verbally on the afternoon of Nov. 3, and signed at 6.30 P.M.

Conclusion.—When hostilities ceased at 3 P.M. on Nov. 4, Italian troops were far up the Trentino and into Cadore, and to the east the line of the old frontier was passed and the middle waters of the Isonzo were reached. On Nov. 3 Trieste had been

occupied from the sea, and half an hour before the expiration of the term fixed by the Armistice an Italian force was landed at Zara. More than 300,000 prisoners had already been counted by the Italians, and the total figure was in the region of 500,000. A number of troops who had been cut off were allowed to pass the frontier after being disarmed, but not much more than half of the Austro-Hungarian troops on the Italian front reached the territory of the crumbling empire. All material was left behind, including some 7,000 guns.

The Austro-Hungarian armies, in spite of bad food and growing depression, began by putting up a stout resistance. The troops in the Grappa sector in particular not only resisted firmly but counter-attacked with great vigour, and punished the Italian IV. Army very heavily. Giardino lost over 23,000 men, more than three-fifths of the total casualty list, which exceeded 35,000.

VITUS, ST. (German, Veit; French, Guy). According to the legend, where he is associated with Modestus and Crescentia, by whom he had been brought up, St. Vitus suffered martyrdom at a very early age under the emperor Diocletian. Son of a Sicilian nobleman who was a worshipper of idols, Vitus was converted to the Christian faith without the knowledge of his father, was denounced by him and scourged, but resisted all attacks on his profession. Admonished by an angel, he crossed the sea to Lucania and went to Rome, where he suffered martyrdom. His festival is celebrated on June 15. The *Passion* of St. Vitus has no historical value, but his name occurs in the *Martyrologium hieronymianum*. In 836 the abbey of Corvey, in Saxony, received his relics, and became a very active centre of his cult. In the second half of the 9th century, the monks of Corvey, according to Helmold's *Chronica Slavorum*, evangelized the island of Rügen, where they built a church in honour of St. Vitus. The islanders soon relapsed, but they kept up the superstitious cult of the saint (whom they honoured as a god), returning to Christianity three centuries later. At Prague, too, there are some relics of the saint, who is the patron of Bohemia and also of Saxony, and one of the fourteen "protectors" (*Nothhelfer*) of the church in Germany. Among the diseases against which St. Vitus is invoked is chorea, also known as St. Vitus' Dance.

Kessel, "St. Veit, seine Geschichte, Verehrung und bildliche Darstellungen," in *Jahrbücher des Vereins von Alterthumsfreunden im Rheinlande* (1867), pp. 152–183. (H. De.)

VIVALDO, UGOLINO and **SORLEONE DE** (*fl.* 1291–1315), Genoese explorers, connected with the first known expedition in search of an ocean way from Europe to India. Ugolino, with his brother Guido or Vadino Vivaldo, was in command of this expedition of two galleys, which he had organized in conjunction with Tedisio Doria, and which left Genoa in May 1291 with the purpose of going to India "by the Ocean Sea" and bringing back useful things for trade. Planned primarily for commerce, the enterprise also aimed at proselytism. With two Franciscan friars and well-armed galleys, Ugolino sailed down the Morocco coast to Gozora (Cape Nun), in 28° 47′ N., after which nothing more was heard of him. Early in the next (14th) century, Sorleone de Vivaldo, son of Ugolino, undertook a search for his father, and even penetrated, it is said, to Magadoxo on the Somali coast. In 1455 another Genoese seaman, Antoniotto Uso di Mare, sailing with Cadamosto in the service of Prince Henry the Navigator of Portugal, claimed to have met, near the mouth of the Gambia, the last descendant of the survivors of the Vivaldo expedition.

VIVARINI, the surname of a family of painters of Murano (Venice), who worked in Venice in the 15th century and played an important part in the development of the Venetian school. The family appears to have come to Murano from Padua.

ANTONIO VIVARINI (1415–1484) worked at first in conjunction with his brother-in-law, Johanes Alamanus, who appears to have been a German by birth. They were the founders of the school of Murano. The Venice academy contains their chief joint work, "The Madonna Enthroned with the Doctors of the Church," painted for the Scuola della Carita in 1446. Other works are in the churches of S. Zaccaria (1443) and S. Pantaleone (1444). In 1447 they worked in Padua on paintings no longer extant, and in the following year undertook the decoration of the ceiling of the Ovetari chapel in the Eremitani church in that city. The National Gallery has two wings with "Saints" of an altarpiece of which the central panel is now in the Poldi Pezzoli collection, Milan. On the death of Johanes (*c.* 1450) Antonio worked with his younger brother, Bartolommeo on the altarpiece now in the Gallery of Bologna (1450).

BARTOLOMMEO VIVARINI (active 1450–1499), was a pupil of his brother Antonio and of Johanes Alamanus. He also studied in Padua, and Paduan influences appear in the altarpiece at Bologna mentioned above, which he executed with his brother in 1450. But he soon outstripped his elder brother and became the head of the school of Murano. His earliest work extant is "The Virgin and Child" of the Hugh Lane collection, signed and dated 1448. The St. John Capistrano of 1459 in the Louvre displays the statuesque qualities typical of his style. The ornate character of the settings, the gold work and the festoons which he often introduces, recall the school of Padua, and in the '60s he seems to have come under Mantegna's influence (altarpiece in the Venice academy [1464] and the "Virgin Enthroned" in the Naples museum [1465]). He reached his height in the stern and majestic "St. Augustine" (1473) in SS. Giovanni e Paolo, Venice.

ALVISE VIVARINI (*c.* 1446–1503) was a pupil of his uncle, Bartolommeo, whose influence is evident in his early work the polyplyth of 1475 at Montefiorentino. His style, however, is more elegant and refined. He learned much from Antonello da Messina, as is evident in the exceedingly plastic male portraits in the Carrara collection at Bergamo and in the National Gallery, London. The most important work of his earlier years is "The Virgin Enthroned and Saints" (*c.* 1485) in the Berlin museum. His later paintings imitate Giovanni Bellini, as for instance the Madonnas in the Vienna museum (1489) and in the churches of the Redentore and S. Giovanni in Bragora, Venice. In the latter church is a "Resurrection," interesting for its unusual and decorative composition.

See L. Testi, *Storia della Pittura Veneziana* (Bergamo, 1909–15). (I. A. R.)

VIVERO, a town of north-western Spain, in the province of Lugo; on the Ria de Vivero, an estuary formed by the river Landrove, which here enters the Bay of Biscay. Pop. (1920) 12,490. Vivero is an old-fashioned town, connected with the opposite bank of the estuary by a bridge of twelve arches and a causeway. Its fishing fleet, its coasting trade and the agricultural products of the fertile country around are important.

VIVÈS, JUAN LUIS (1492–1540), Spanish scholar, was born at Valencia on March 6, 1492. He studied at Paris from 1509 to 1512, and in 1519 was appointed professor of humanities at Louvain. At the instance of his friend Erasmus he published in 1522 an elaborate commentary on Augustine's *De Civitate Dei* with a dedication to Henry VIII. Soon afterwards he was invited to England, and is said to have acted as tutor to the princess Mary, for whom he wrote *De ratione studii puerilis epistolae duae* (1523). He resided at Corpus Christi college, Oxford, where he was made doctor of laws and lectured on philosophy. Having declared himself against the king's divorce from Catherine

of Aragon, he lost the royal favour and was confined to his house for six weeks. On his release he withdrew to Bruges, where he wrote numerous works, chiefly directed against scholasticism and the preponderant authority of Aristotle. His chief work is the *De Causis corruptarum artium,* which has been ranked with Bacon's *Organon.* In 1538 Vives published the *De anima et vita,* one of the first modern works on psychology. Neither Descartes (1596–1650), nor Francis Bacon (1561–1626), were the first Renaissance writers to give their attention to psychological theory, as is commonly supposed. Bacon, it is true, was the most influential advocate of the empirical scientific method of the 17th century, but Vives preceded him in emphasizing induction as a method of philosophical and psychological discovery. In his preface to the *De anima,* Vives accuses the ancients of having involved themselves in great absurdities; and in the first book he abjures the traditional manner of asking the metaphysical question, "What is the soul?" by saying, "What the soul is, is of no concern for us to know. What its manifestations are, is of great importance." And in his discussion of the mind he continued his point of view; he did not refer to the essence of mind but concerned himself with the actions of the mind. His central idea is that knowledge is of value only when it is put to use. He then discusses association of ideas, the nature of memory, a proposed law of forgetfulness, the method of recall of an idea; he explained the principle of mnemonics, and even touched on animal psychology. In the second book he describes in detail the functions of the *simplex intelligentia* (simple apprehension); and in the third book, he examines the emotions or passions. The *De disciplinis* (1531), and the *Linguae latinae exercitatio* (1539), are the great pedagogical works of Vives, the former probably the greatest Renaissance book on education. Juan Luis Vives died at Bruges on May 6, 1540.

A complete edition of his works was published by Gregorio Mayáns y Siscar (Valencia, 1782). Adolfo Bonilla y San Martin's *Luis Vives y la filosofía del renacimiento* (Madrid, 1903) is a valuable study with an exhaustive bibliography. *See* also G. Hoppe, *Die Psychologie von Juan Luis Vives* (1901).

VIVIANI, RENÉ (1863–1925), French politician, was born at Sidi-bel-Abbès, Algeria, on Nov. 8, 1863. While still a young man, he made a considerable reputation as a lawyer, and in 1893 was elected Socialist deputy for Paris. It was not until the close of his life that he left the Chamber to enter the Senate. In Oct. 1906 he was placed by Clemenceau at the head of the recently-created ministry of labour. In the following month he made a famous speech in the Chamber, in which he affirmed his atheistic belief. For these views he was often severely criticized subsequently. "We have put out the lights of heaven," he said, "and they will never be lit again." Viviani was responsible for the law with regard to workmen's pensions. In July 1909 when Briand succeeded Clemenceau as premier, Viviani continued to be minister of labour. In Oct. 1910, in consequence of the attitude adopted by the Government in regard to the threatened railway strike, he tendered his resignation. In Dec. 1913 he became minister of public instruction in the Doumergue cabinet.

In June 1914 Viviani became premier and minister for foreign affairs. He was on his way back from Russia with Poincaré when the Austrian ultimatum was issued against Serbia on July 23. He immediately withdrew the French troops 10 km. behind the frontier to prove France's pacific attitude. When Germany declared war he made a magnificent speech in the chamber which had an electrifying effect on his audience. On Oct. 29, 1915 he was succeeded as premier by Briand, in whose Government he became minister of justice. After the fall of the Briand cabinet in March 1917 he lived in retirement, but he accompanied M. Briand to the Washington Conference in 1921 as one of the leading French delegates. He died at Clamart (Seine) on Sept. 7, 1925, after a long and painful illness. Viviani's eloquence, with its wealth of imagery and brilliant metaphor, has seldom if ever been equalled in the French Parliament. But it was, above all, the rôle he played during the tragic events of July and Aug. 1914 which caused his name to go down to history. (P. B.)

VIVIANITE, a mineral consisting of hydrated iron phosphate $Fe_3(PO_4)_2+8H_2O$, crystallizing in the monoclinic system. The crystals possess a perfect cleavage parallel to the plane of symmetry and are usually bladed in habit; they are very soft, flexible and sectile. When unaltered and containing no ferric oxide, the mineral is colourless, but on exposure to the light it very soon becomes of a characteristic indigo-blue colour. Crystals were first found in Cornwall by J. G. Vivian, after whom the species was named in 1817. The mineral had, however, been earlier known as a blue powdery substance, called "blue iron-earth," met with in peat-bogs, in bog iron-ore, or with fossil bones and shells.

VIVISECTION. The term popularly applied to experiments on animals (*see* ANIMALS, EXPERIMENTS ON). Even in the early days of legislation on the subject when physiology was in its infancy, the name was only in a measure accurate, as cutting experiments formed but a portion of the experiments on animals. Investigations on body temperature, respiration, digestion, the action of drugs, in many instances involved no cutting operation of any kind; still they were included under the general name of vivisection because they were carried out on living animals. At the present time, though the number of animal experiments in Great Britain and the civilized world generally has increased proportionately with the modern greater pursuit of medical knowledge in all its branches, cutting experiments form an insignificant proportion of the whole. Probably it is true to say that the procedure in over 90% of so-called vivisection experiments consists in nothing more formidable than a prick with a hypodermic needle and the injection of a small quantity of fluid or of solid tissue beneath the skin of a mouse, rat, guinea-pig or rabbit. That, in some instances, a disease is thereby conveyed to the animal, is true, but this is only a stage in the endeavour to elucidate the nature of the disease in question and to devise a means for combating it whether the disease be one affecting man or one of the domestic animals.

That experiment in the broadest sense is necessary to the advancement of knowledge, cogitation alone being insufficient, has been shown by every branch of science. Indeed, it has been said that without experiment no substantial advance in knowledge of the physical sciences has occurred and the example of volcanic action has been adduced. We know, to-day, little more concerning volcanoes than was known centuries ago because we cannot experiment with volcanoes; such additional knowledge as we possess depends upon experiments on explosives conducted on a small scale. In the case of medical science living men and animals are concerned. In the case of human disease an earlier investigation has almost always been carried out on lower animals. As examples may be given the antitoxin treatment of diphtheria, the prophylactic vaccine inoculation for typhoid and paratyphoid fevers, the insulin treatment of diabetes. By most persons it is held that the testing of a hypothesis in medicine should, in the first instance, be carried out on lower animals. By some it is considered that the attainment of manual dexterity in the performance of surgical operations should also be carried out by practice on lower animals, but this is forbidden by law in Great Britain. The essence of "vivisection" consists in the fact that the experiment is conducted in the pursuit of knowledge and the term has lost, to a large extent, its etymological meaning of *cutting with a knife* and, in general, implies experiments on living animals carried out for the advancement of *medical* knowledge. Breeding and feeding experiments carried out by the farmer for the improvement of his stock, operations such as gelding, docking and de-horning are not included under the term.

The extent to which the British law on animal experiment is applicable is shown by the following example. In the bacterial treatment of sewage at a certain town the effluent was so clear that an ornamental pool was made and some goldfish were placed therein. It was held that this constituted an animal experiment under the act inasmuch as it was not known that the fish would not be injured thereby. The example is useful as showing the vigilance of the authorities over the unquestioned rights of lower animals as determined by law.

No account of animal experiment would be complete without reference to the opposition that such experiments have aroused in

certain countries. In England "anti-vivisectionists" have formed a society and published a journal. There are two lines of thought, one that aims at total abolition, another that wishes experiments on dogs to be prohibited. To combat these views the Research Defence Society was founded in 1908 and issues literature on the subject from time to time. The main argument of anti-vivisectionists is that man is not morally justified in profiting by experiments at the expense of lower animals. Arising from this principle it is contended (1) that the friendship of the dog and the cat for man and their trustfulness render experiments on them particularly undesirable; (2) that such experiments tend to injure the moral character of the operator; (3) that many of the beneficial results ascribed to animal experiments have been dependent upon other causes than the experiments; (4) that in numerous instances there is difference of opinion even amongst experimenters; and (5) that lower animals and man differ so greatly that application of results obtained in lower animals to man is unjustifiable. These contentions are controverted by the other party. Probably natural mental attributes ultimately determine whether animal experiment is viewed with approval or disapproval, but either view to be respected must be based upon extensive and accurate knowledge, accurate statement and sincerity. Unfortunately these are not always manifested by protagonists. (W. S. L-B.)

VIZAGAPATAM, a town and district of British India, in the Madras presidency. The town stretches along the coast, and has a station on a short branch of the East Coast railway, 484 m. N.E. of Madras. Pop. (1921) 44,711. It lies on a small bay. The town or fort, as it is called, is separated from the southern promontory, the Dolphin's Nose, by a small river, which forms a bar where it enters the sea. The port is growing in importance, as the only protected harbour on the coast, though large vessels have to lie 1 m. off shore. A harbour was in course of construction in 1929. It will be developed by the Bengal-Nagpur railway company, under government control, to supply an outlet for the fertile east coast area. An English factory was established here early in the 17th century, which was captured by the French in 1757, but shortly afterwards recovered. The town owes much to the munificence of the neighbouring raja of Vizianagram. A water supply has been provided. Waltair at the north end of the bay is the European quarter and a health resort. The exports by sea include manganese ore, ground nuts and sugar.

The DISTRICT OF VIZAGAPATAM has an area of 4,568 square miles. It is a picturesque and hilly country, but for the most part unhealthy. The main portion is occupied by the Eastern Ghats, whose slopes are clothed with luxuriant vegetation and forest trees. The drainage on the east is carried by numerous streams direct to the sea, and that to the west flows into the Godavari through the Indravati or through the Sabari and Siller rivers. To the west of the range is situated the greater portion of the extensive zamindari of Jaipur, which is for the most part very hilly and jungly. In the extreme north a remarkable mass of hills, called the Nimgiris, rise to a height of 5,000 ft. There are great varieties of climate. The average annual rainfall at Vizagapatam exceeds 40 inches. Pop. (1921) 2,231,874. The principal crops are rice, millets, pulses and oil-seeds, with some sugar-cane, cotton, spices and tobacco. Manganese is largely mined, and a little bauxite worked.

On the dissolution of the Mogul empire Vizagapatam formed part of the territory known as the Northern Circars, which were ceded to the East India Company by treaties in 1765 and 1766. The Agency, a hilly inland tract which formed more than two-thirds of the district, has recently been incorporated with the agencies of Ganjam and Godavari into a new division.

VIZETELLY, HENRY (1820–1894), English publisher, was born in London on July 30, 1820, the son of a printer. He was early apprenticed as a wood engraver, and one of his first blocks was a portrait of "Old Parr." Vizetelly started and conducted several illustrated papers, and then acted as correspondent of the *Illustrated London News* in Paris and then in Berlin. In 1887 he established a publishing house in London, issuing numerous translations of French and Russian authors. In 1888 he was prosecuted for publishing a translation of Zola's *La Terre,* and was fined £100; and when he reissued Zola's works in 1889 he was again prosecuted, fined £200 and imprisoned for three months. He died on Jan. 1, 1894.

See his *Glances back through Seventy Years* (1893).

VIZEU or VISEU, a Portuguese episcopal city at the terminus of a branch of the Figueira da Foz-Guarda railway. Pop. (1911) 8,167. The city stands near the ruins of the ancient *Vacca,* or *Cava de Viriato,* a Roman military colony founded by Decius Brutus and captured by Viriathus (2nd century B.C.). The administrative district of Vizeu coincides with the central and northern parts of the ancient province of Beira (*q.v.*). Pop. (1920), 404,864; area, 1,937 sq.m.

VIZIANAGRAM, a town of British India, in the Vizagapatam district of Madras, 17 m. from the seaport of Bimlipatam, on the East Coast railway, 522 m. N.E. of Madras. Pop. (1921) 39,299. It has a small military cantonment. It contains the residence of a *zamindar* of the same name, who ranks as the first Hindu nobleman of Madras. His estate covers about 3,000 sq.m., with a population of 900,000.

VIZIER, more correctly VIZIR (Arabic *Wazīr*), literally "burden-bearer" or "helper," originally the chief minister or representative of the Abbasid caliphs (*see* MOHAMMEDAN INSTITUTIONS; CALIPHATE; and BARMECIDES).

VLAARDINGEN, a river port of Holland, in the province of South Holland, on the Maas, 6 m. W. of Rotterdam by rail. Pop. (1927), 27,236. A very old town and the seat of a former margraviate belonging to the counts of Holland, Vlaardingen is now chiefly important as the centre of the great herring and cod fisheries of the North Sea.

VLACHS. The Vlach (Wallach) or Ruman race constitutes a distinct division of the Latin family of peoples, widely disseminated throughout south-eastern Europe, both north and south of the Danube, and extending sporadically from the Bug to the Adriatic. The total numbers of the Vlachs may be approximately estimated at from 9,000,000 to 11,000,000. Of these the vast majority reside in the kingdom of Rumania, as enlarged by the World War. South of the Danube, a now diminishing number are scattered over northern Greece under the name of Kutzo ("lame")-Vlachs, Tzintzars or Aromani. In Serbia this element is preponderant in the Timok valley, while in Istria it is represented by the Cici, at present largely Slavonized, as are now entirely the kindred Morlachs of Dalmatia. In Bulgaria Vlachs are found chiefly in the western Rhodopes.

A detailed account of the physical, mental and moral characteristics of the Vlachs, their modern civilization and their historical development, will be found under the headings RUMANIA and MACEDONIA. All divisions of the race, whether inhabitants of the kingdom of Rumania or not, prefer to style themselves *Romani, Romeni, Rumeni* or *Aromani.* The name "Vlach" (Slav *Volokh* or *Woloch,* Greek *Vlachoi,* Magyar *Olóh,* Turkish *Iffl6k*), which is now used by the Rumans themselves, represents a Slavonic adaptation of a generic term applied by the Teutonic races to all Roman provincials during the 4th and 5th centuries.

The Vlachs claim to be a Latin race in the same sense as the Spaniards or Provençals—Latin by language and culture, and, in a smaller degree, by descent. This claim is generally accepted by ethnologists. The language of the Vlachs is Latin in structure and to a great extent in vocabulary; their features and stature would not render them conspicuous as foreigners in south Italy; and that their ancestors were Roman provincials is attested not only by the names "Vlach" and "Ruman" but also by popular and literary tradition. In their customs and folk-lore both Latin and Slavonic traditions assert themselves. Of their Roman traditions the Trajan saga, the celebration of the Latin festivals of the Rosalia and Kalendae, the belief in the *striga* (witch), the names of the months and days of the week, may be taken as typical examples. Some Roman words connected with the Christian religion, like *biserica* (*basilica*)=a church, *botez*=*baptizo, duminica*=Sunday, *preot* (*presbyter*)=priest, point to a continuous tradition of the Illyrian church, though most of their ecclesiastical terms, like their liturgy and alphabet, were derived from the Slavonic. In most that concerns political organization the

Slavonic element is also preponderant, though there are words like *impărat=imperator,* and *domn=dominus,* which point to the old stock. Many words relating to kinship are also Latin, some, like *vitrig* (*vitricus*)=father-in-law, being alone preserved by this branch of the Romance family.

The centre of gravity of the Vlach race is at present unquestionably north of the Danube in the almost circular territory between the Danube, Theiss and Dniester; and corresponds roughly with the Roman province of Dacia, formed by Trajan in A.D. 106. From this circumstance the popular idea has arisen that the race itself represents the descendants of the Romanized population of Trajan's Dacia, which was assumed to have maintained an unbroken existence in Walachia, Transylvania and the neighbouring provinces, under the dominion of a succession of invaders. The Vlachs of Pindus, and the southern region generally, were regarded as later immigrants from the lands north of the Danube. In 1871, E. R. Roesler published at Leipzig his *Romänische Studien,* in which he absolutely denied the claim of the Rumanian Vlachs to be regarded as autochthonous Dacians. He laid stress on the statements of Vopiscus and others as implying the total withdrawal of the Roman provincials from Trajan's Dacia by Aurelian, in A.D. 272, and on the non-mention by historians of a Latin population in the lands on the left bank of the lower Danube, during their successive occupation by Goths, Huns, Gepidae, Avars, Slavs, Bulgars and other barbarian races. He found the first trace of a Ruman settlement north of the Danube in a Transylvanian diploma of 1222. His conclusions had to a great extent been already anticipated by F. J. Sulzer in his *Geschichte des Transalpinischen Daciens,* published at Vienna in 1781, and at a still earlier date by the Dalmatian historian Lucius of Traü in his work *De Regno Dalmatiae et Croatiae* (Amsterdam, 1666). They found a determined opponent in Dr. J. Jung, of Innsbruck, who upheld the continuity of the Roman provincial stock in Trajan's Dacia, disputing from historic analogies the total withdrawal of the provincials by Aurelian; and the reaction against Roesler was carried still farther by J. L. Pič, Prof. A. D. Xenopol of Jassy, B. P. Hasdeu, D. Onciul and many other Rumanian writers, who maintain that, while their own race north of the Danube represents the original Daco-Roman population of this region, the Vlachs of Greece are similarly descended from the Moeso-Roman and Illyro-Roman inhabitants of the provinces lying south of the river. On this theory the entire Vlach race occupies almost precisely the same territories to-day as in the 3rd century.

On the whole it may be said that the truth lies between the two extremes. Roesler is no doubt so far right that after 272, and throughout the early middle ages, the bulk of the Ruman people lay south of the Danube. But it is reasonable to suppose a Latin-speaking population continuing to exist in the formerly thickly colonized area embracing the present Transylvania and Little Walachia, with adjoining Carpathian regions.

Early Migrations.—We may therefore assume that the Latin race of eastern Europe never wholly lost touch with its former trans-Danubian strongholds. It was, however, greatly diminished there. The open country, the broad plains of what is now Rumania and the Banat were in barbarian occupation. The centre of gravity of the Roman or Romance element of Illyricum had now shifted south of the Danube. By the 6th century a large part of Thrace, Macedonia and even of Epirus had become Latin-speaking.

What had occurred in Trajan's Dacia in the 3rd century was consummated in the 6th and 7th throughout the greater part of the South-Illyrian provinces, and the Slavonic and Avar conquests severed the official connection with eastern Rome. The Roman element was swept hither and thither by the barbarian flood. Nomadism became an essential of independent existence, while large masses of homeless provincials were dragged as captives to be distributed in servile colonies. They were thus in many cases transported by barbarian chiefs—Slav, Avar and Bulgarian—to trans-Danubian and Pannonian regions. The earliest Hungarian historians who describe the Magyar invasion of the 9th century speak of the old inhabitants of the country as Romans, and of the country they occupied as *Pascua Romanorum*; and the Russian Nestor, writing about 1100, makes the same invaders fight against Slavs and Vlachs in the Carpathians. So far from the first mention of the Vlachs north of the Danube occurring only in 1222, it appears from a passage of Nicetas of Chonae that they were to be found already in 1164 as far afield as the borders of Galicia; and a passage in the *Nibelungenlied,* which mentions the Vlachs, under their leader Râmunc, in association with the Poles, cannot well be later than 1200.

Nevertheless, through the early middle ages the bulk of the Ruman population lay south of the Danube. It is here that this new Illyrian Romance race first rises to historic prominence. Already in the 6th century, as we learn from the place-names, such as Sceptecasas, Burgualtu, etc., given by Procopius, the Ruman language was assuming, so far as its Latin elements were concerned, its typical form. In the later campaigns of Commentiolus (587) and Priscus, against the Avars and Slavs, we find the Latin-speaking soldiery of the Eastern emperor making use of such Romance expressions as *torna frate!* (turn, brother!), or *sculca* (out of bed) applied to a watch (*cf.* Ruman *a se culca*=Italian *coricarsi*+*ex*-[*s*-] privative). Next we find this warlike Ruman population largely incorporated in the Bulgarian kingdom, and, if we are to judge from the names Paganus and Sabinus, already supplying it with rulers in the 8th century. The blending and close contact during this period of the surviving Latin population with the Slavonic settlers of the peninsula impregnated the language with its large Slavonic ingredient. The presence of an important Latin element in Albanian, the frequent occurrence of Albanian words in Rumanian, and the remarkable retention by both languages of a suffix article, may perhaps imply that both alike took their characteristic shapes in the same region.

Byzantium, which had ceased to be Roman, and had become Romanic, renewed its acquaintance with the descendants of the Latin provincials of Illyricum through a Slavonic medium, and applied to them the name of Vlach, which the Slav himself had borrowed from the Goth. The first mention of Vlachs in a Byzantine source is about the year 976, when Cedrenus (ii. 439) relates the murder of the Bulgarian tsar Samuel's brother "by certain Vlach wayfarers," at a spot called the Fair Oaks, between Castoria and Prespa. From this period onwards the Ruman inhabitants of the Balkan peninsula are constantly mentioned by this name, and we find a series of political organizations and territorial divisions connected with the name of *Vlachia.* A short synopsis may be given of the most important of these, outside the limits of Rumania itself.

Political and Territorial Divisions.—1. *The Bulgaro-Vlach Empire.*—After the overthrow of the older Bulgarian tsardom by Basil "the Bulgar-slayer" (976–1025), the Vlach population of Thrace, Haemus and the Moesian lands passed once more under Byzantine dominion; and in 1185 a heavy tax, levied in kind on the cattle of these warlike mountain shepherds, stirred the Vlachs to revolt against the emperor Isaac Angelus, and under the leadership of two brothers, Peter and Asen, to found a new Bulgaro-Vlachian empire, which ended with Kaliman II. in 1257. The dominions of these half-Slavonic half-Ruman emperors extended north of the Danube over a great deal of what is now Rumania, and it was during this period that the Vlach population north of the river seems to have been most largely reinforced. The 13th-century French traveller Rubruquis speaks of all the country between the Don and Danube as *Asen's land* or *Blakia.*

2. *Great Walachia* (Μεγάλη Βλαχία).—It is from Anna Comnena, in the second half of the 11th century, that we first hear of a Vlach settlement, the nucleus of which was the mountainous region of Thessaly. Benjamin of Tudela, in the succeeding century, gives an interesting account of this Great Walachia, then completely independent. It embraced the southern and central ranges of Pindus, and extended over part of Macedonia, thus including the region in which the Roman settlers mentioned in the *Acts* of St. Demetrius had fixed their abode. After the Latin conquest of Constantinople in 1204, Great Walachia was included in the enlarged despotat of Epirus, but after passing under the yoke of the Serb emperor Dushan and other Serbian rulers in the 14th century, was finally conquered by the Turks in 1393. Many

of their old privileges were accorded to the inhabitants, and their taxes were limited to an annual tribute.

3. *Little Walachia* (Μικρὰ Βλαχία) was a name applied by Byzantine writers to the Ruman settlements of Aetolia and Acarnania, and with it may be included "Upper Walachia," or Ἀνω-βλαχία. Its inhabitants are still represented by the Tzintzars of the Aspropotamo and the Karaguni (Black Capes) of Acarnania.

4. *The Morlachs (Mavrovlachi) of the West.*—These are already mentioned as *Nigri Latini* by the presbyter of Dioclea (*c.* 1150) in the old Dalmatian littoral and the mountains of Montenegro, Herzegovina and North Albania. Other colonies extended through a great part of the old Serbian interior, where is a region still called Stara Vlaška or "Old Walachia." The great commercial staple of the east Adriatic shores, the republic of Ragusa, seems in its origin to have been a Ruman settlement, and many Vlach traces survived in its later dialect. In the 14th century the Mavrovlachi or Morlachs extended themselves towards the Croatian borders, and a large part of maritime Croatia and northern Dalmatia began to be known as *Morlacchia*. A *Major Vlachia* was formed about the triple frontier of Bosnia, Croatia and Dalmatia, and a "Little Walachia" as far north as Požega. The Morlachs have now become Slavonized (*see* DALMATIA).

5. *Cici of Istria.*—The extreme Ruman offshoot to the north-west is still represented by the Cici of the Val d'Arsa and adjoining Istrian districts. They represent a 15th-century Morlach colony from the isle of Veglia, and had formerly a wider extension to Trieste and the counties of Gradisca and Görz. The Cici have almost entirely abandoned their native tongue, which is the last remaining representative of the old Morlach, and forms a connecting link between the Daco-Roman (or Rumanian) and the Illyro- or Macedo-Roman dialects.

6. *Rumans of Transylvania and Hungary.*—As already stated, a large part of the Hungarian plains were, at the coming of the Magyars in the 9th century, known as *Pascua Romanorum*. At a later period privileged Ruman communities existed at Fogaras, where was a *Silva Vlachorum*, at Marmaros, Deva, Hatzeg, Hunyad and Lugos, and in the Banat were seven Ruman districts. Two of the greatest figures in Hungarian history, the 15th-century rulers John Corvinus of Hunyad and his son King Matthias, were due to this element. For its later history *see* TRANSYLVANIA.

VLADIKAVKAZ, a town of Russia in the North Caucasian area, in 43° 3′ N., 44° 42′ E. Pop. (1926) 73,603. Its name means "Key of the Caucasus," and it stands on a plateau 2,345 ft. high on both sides of the Terek river, where the latter issues from the Darial gorge. Towering above the town is the famous Kasbek peak. A small fort was established here in 1784, but the expansion of the town dates from the completion of the great Georgian military road southwards through the gorge to Tiflis, which was begun in 1811 and opened in 1864. Later a railway link was made through Beslan to the Rostov-Baku line to the north. The great gorge has much historic importance for the region; through it came Persian armies and, later, Timur and his Mongol hordes, and its military road brought about the pacification of the warring Caucasian frontier tribes and gave Russia her foothold in the Caucasus.

VLADIMIR, ST. (*c.* 956–1015), grand duke of Kiev and of all Russia, was the youngest son of Svyatoslav I. and his mistress Malushka. In 970 he received Great Novgorod as his apanage. On the death of Svyatoslav in 972, a long civil war took place between his sons Yaropolk and Oleg, in which Vladimir was involved. From 977 to 984 he was in Scandinavia, collecting as many of the viking warriors as he could to assist him to recover Novgorod, and on his return marched against Yaropolk. On his way to Kiev he sent ambassadors to Ragvald, prince of Polotsk, to sue for the hand of his daughter Ragnilda. The haughty princess refused to affiance herself to "the son of a bondswoman," but Vladimir attacked Polotsk, slew Ragvald and took Ragnilda by force. Subsequently (980) he captured Kiev also, slew Yaropolk by treachery, and was proclaimed prince of all Russia. In 981 he conquered the Chervensk cities, the modern Galicia; in 983 he subdued the heathen Yatvyags, whose territories lay between Lithuania and Poland; in 985 he led a fleet along the central rivers of Russia to conquer the Bulgars of the Kama, planting numerous fortresses and colonies on his way. At this time Vladimir was a thoroughgoing pagan. He increased the number of the *trebishcha*, or heathen temples; offered up Christians (Theodore and Ivan, the protomartyrs of the Russian Church) on his altars; had eight hundred concubines, besides numerous wives; and spent his whole leisure in feasting and hunting. He also formed a great council out of his boyars, and set his twelve sons over his subject principalities.

In the year 987, as the result of a consultation with his boyars, Vladimir sent envoys to study the religions of the various neighbouring nations whose representatives had been urging him to embrace their respective faiths. The result is amusingly described by the chronicler Nestor. Of the Muslim Bulgarians of the Volga the envoys reported "there is no gladness among them; only sorrow and a great stench; their religion is not a good one." In the temples of the Germans they saw "no beauty"; but at Constantinople, where the full festival ritual of the Orthodox Church was set in motion to impress them, they found their ideal. "We no longer knew whether we were in heaven or on earth, nor such beauty, and we know not how to tell of it." If Vladimir was impressed by this account of his envoys, he was yet more so by the offer of the emperor Basil II. to give him his sister Anna in marriage. In 988 he was baptized at Kherson in the Crimea, taking the Christian name of Basil out of compliment to his imperial brother-in-law; the sacrament was followed by his marriage with the Roman princess. Returning to Kiev in triumph, he converted his people to the new faith with no apparent difficulty.

The remainder of the reign of Vladimir was devoted to good works. He founded numerous churches, including the splendid *Desyatinnuy Sobor* or "Cathedral of the Tithes" (989), established schools, protected the poor and introduced ecclesiastical courts. With his neighbours he lived at peace, the incursions of the savage Petchenegs alone disturbing his tranquillity. His nephew Svyatopolk, son of his brother and victim Yaropolk, he married to the daughter of Boleslaus of Poland. He died at Berestova, near Kiev, while on his way to chastise the insolence of his son, Prince Yaroslav of Novgorod. The various parts of his dismembered body were distributed among his numerous sacred foundations and were venerated as relics.

VLADIMIR, a province of the Russian S.F.S.R., surrounded by those of Moscow, Yaroslavl, Ivanovo-Voznesensk, Nizhegorod and Ryazan, not coinciding with the pre-1917 province of the same name. Area 30,104 sq. kilometres. Pop. (1926) 1,319,836. It is part of the Central Russian plateau (800–950 ft.) and is grooved by river valleys to a depth of 300 to 450 ft., giving the province a hilly appearance.

The soil is for the most part unfertile, save in the district of Yuriev, where are patches of black earth, which have occasioned a good deal of discussion among Russian geologists. Iron ore is widely diffused, and china clay and gypsum are met with in several places. The climate is continental, with 5 months' frost, an average January temperature of 16° F and July 66·5° F, average rainfall 18 to 20 inches. The province is drained by the Oka and its tributary, the Klyazma, which is navigable to Kovrov, and in some parts of summer to Vladimir. Forest, mainly coniferous, covers 43·7% of the province, and marshes cover vast areas in the east. There are many small lakes. Tver is supplied with electricity from a peat-using station on the Great Ursov bog.

Ploughed land occupies three times the area under pasture, and

cattle raising and dairying are of less importance than in the surrounding provinces. The chief crops are rye (48·1%), oats (23·1%), and potatoes (11·6%). Buckwheat, flax, hemp, grass, orchard fruits, especially cherries and apples, and berries are cultivated. Flax cultivation, which demands much labour, is more developed than in Moscow province, where the peasants leave the soil and drift to the factories, but even in Vladimir it is not cultivated in the factory areas. There is a great development of koustar (peasant) textile industries, including the making of linen and woollen piece stuff and knitted goods. Leather, sheep skin and felt are prepared, wooden utensils of every kind, and *lapti* or shoes made of lime-tree bark. The painting of sacred pictures (ikons) still continues, though there is far less demand for them since the revolution. There are smelting, textile, paper, glass, dyeing, timber, cardboard and boot factories. There are boiler-shops and seed-pressing mills.

Vladimir is a region of ancient human settlement. Numbers of Palaeolithic stone implements intermingled with bones of the mammoth and the rhinoceros, and still greater numbers of Neolithic stone implements, have been discovered. There are burial-mounds belonging to the Bronze and Iron periods, and containing decorations in amber and gold; nearly 2,000 such burial-mounds are scattered round Lake Pleshcheyevo, some of them belonging to the pagan period and some to the early Christian.

The descendants of Karelian families, settled by Peter the Great around Lake Pereyaslavl, still preserve their language and customs, otherwise the province is entirely Great Russian. During the 12th century the principalities of Vladimir, Suzdal and Rostov were united under one grand prince. In the 13th century the Mongols under Batu Khan overran the district and ruled it till 1328, when it was annexed to Moscow.

VLADIMIR, the chief town of the above province, known in history as Vladimir-on-the-Klyazma, to distinguish it from Vladimir in Volhynia. It is picturesquely situated on the Klyazma and Lybed, in 56° 8′ N., 40° 20′ E. Pop. (1926) 35,319. The town is a trading centre on the railway and river between Moscow and Nizhniy-Novgorod. There are factories for knitted goods, fruit juice and bricks, and there are oil-pressing and saw-milling industries. Extensive cherry orchards occupy the surrounding slopes, and in each is a small watch-tower, with cords drawn in all directions to be shaken by the watcher when birds alight. The citadel stands on a hill and contains two very old cathedrals—the Uspenskiy (1150; restored in 1891), where all the princes of Vladimir have been buried, and the Dmitrievskiy (1197; restored in 1834–35). Several churches date from the 12th century.

Vladimir first comes into notice in 1151, when Andrei Bogolyubskiy secretly left Vyshgorod—the domain of his father in the principality of Kiev—and migrated to the newly settled land of Suzdal, where he became (1157) grand prince of the principalities of Vladimir, Suzdal and Rostov. Although Ivan Kalita (1328–41) made Moscow the real head of the *Rus* States, Vladimir remained the coronation city of the grand princes until 1431, and Simeon the Proud, Ivan the Good, Dmitri of the Don and Vasili I. were crowned here.

VLADIMIRESCU, TUDOR (?–1821), Rumanian leader, is first heard of leading a corps of Rumanian volunteers against the Turks in the wars of 1812. For his services he received a Russian decoration and the rank of major. After the war the privileges of the Pandours whom Vladimirescu had led were annulled; but he retained his influence as a national leader. In 1820 he was approached by Georgaki, the assistant of Prince Alexander Ypsilanti (*q.v.*) with a request to organize a rebellion to assist the Greek rising. Vladimirescu raised a Rumanian irregular force, and although he led this to join Ypsilanti, he preached a Rumanian national crusade, directed precisely against the Phanariot Greek priests and *boyars*. The Rumanian peasantry flocked round him. By Jan. 1821 he was master of all Oltenia, and marched to Bucharest. Russia, however, failed to support Ypsilanti; instead, the Turks moved against him. Ypsilanti, finding that Vladimirescu was aiming at anything rather than a pro-Greek movement, had him arrested and allowed him to be assassinated at Târgoviste.

VLADIMIR VOLHYNSKIY: *see* WŁODZIMIERZ-WOLYNSKI, a town in the province of Warsaw, Poland.

VLADIVOSTOK (vlah-dē-vŏs-tŏk′), a port of Asiatic Russia, in 43° 11′ N., 131° 53′ E. It stretches along the northern shore of the Golden Horn, on the slope of a ridge of hills extending westwards to the shore of Amur bay. It is the most important town in the Far Eastern Area, though not the administrative centre, and its easily accessible harbour 4 m. long by 1 m. broad, kept open all the winter by ice breakers, has made it the most important naval and commercial centre on the Russian Pacific coast. Pop. (1926) 102,454. The commercial port occupies the western part of the Golden Horn and there is a stone mole about 5,200 ft. long for berthing and unloading ships; the pontoon stages are 6,300 ft. long; there is storage capacity for 340,000 tons. The docks include two dry and a floating one and there are nine floating cranes (30 to 150 tons), one bridge crane and engineering and repairing yards for ships. Soya bean oil is an important export, and a tank oil storehouse (capacity 1,900 tons), with four conveyers, each having a capacity of 50 tons per hour, has been constructed. The cargo turnover of the port is between 2,000,000 and 3,000,000 tons; the exports are mainly soya beans, soya bean oil, bean cake, seeds, timber and fish. Much of both import and export trade is of a transit character to and from Manchuria, notably soya beans, tea and salt. Efforts are being made to develop the fishing industry and a hydrobiological station was established at Basargin peninsula in 1925. On some islands near Vladivostok breeding grounds for reindeer, elk, roebuck and other animals have been established recently.

Muraviev selected the site after the Treaty of Aigun (1858) by which the district was ceded to Russia: a railway via Manchuria and the Trans-Baikal district reached the town in 1897, though the final link with the trans-Siberian was not completed till 1917. The full effects of this link have not yet been felt owing to the destruction consequent on the prolonged post-1917 fighting along the railway. Wireless stations have been established and there is cable connection to Japan. The opening of the Odessa to Vladivostok sea route gave a marked impetus to colonisation, which still goes on via this route to the eastern parts of Siberia.

VOCATIONAL TRAINING. Logically, the term vocational training should include preparation for the practice of medicine, law and other professions; but it is convenient to restrict it to courses of regular instruction intended to fit boys and girls for commerce, domestic life or some branch of industry. The rapidly growing complexity of industry and commerce and the intensity of international competition compelled all the progressive nations to consider the provision of vocational training, in this sense, to replace or to supplement the methods of apprenticeship (*q.v.*) which sufficed in simpler times. It is, moreover, widely held that under the conditions of modern life, especially in great cities, some form of education, continued through the critical years of adolescence, is needed to preserve the physical, intellectual and moral health of the masses of the people; and vocational training, with its appeal to the practical interests of young wage-earners, is regarded as particularly effective.

Administration.—In some countries vocational schools are administered as part of the general educational system. In England, for instance, they are provided by the ordinary local authorities for education and subsidized through the Board of Education. In other countries vocational training is treated rather as a distinct educational function.

Types of Courses.—In the chief countries many large cities provide vocational schools offering "all-day" courses lasting from two to four years, sometimes in combination with a modified form of trade apprenticeship. These prepare pupils for office, business and other commercial activities, or serve industries such as agriculture, engineering, furniture making, upholstery, dressmaking (*see* TECHNICAL EDUCATION; CONTINUATION SCHOOLS), which offer scope for highly trained skill or taste, scientific or technical knowledge and capacity for leadership. But by far the greatest amount of vocational training is given everywhere in part-time continuation classes: *i.e.*, classes which provide a few hours of instruction per week for boys and girls who have left the elementary schools and have already entered upon some occu-

pation. In parts of Germany and Czechoslovakia attendance at continuation classes, generally in the evening and on Sundays, was long ago imposed upon elementary school leavers; but the modern tendency, largely influenced by the pioneer work of Kerschensteiner at Munich, is to require employers to release their young employees for instruction during working hours. In England and Germany laws making this system universal and compulsory have been adopted since the World War, but financial difficulties in both countries retarded the development.

In some countries "works schools," maintained by employers for the training of their employees, are an important supplement to the public provision for vocational education. They are especially numerous and well-organized in Germany, but in England met with some disfavour on political and educational grounds.

Finally, it should be noted that programmes of vocational training almost always include some teaching intended to continue and widen the student's general education. Instruction in the duties of citizenship is common, and in many cases attention is given to physical training and hygienic teaching. (T. P. N.)

UNITED STATES

Trade and industrial training is secured by workers in various ways: (1) learning on the job by the pick-up method without educational supervision, (2) learning in shop-training departments or vestibule schools maintained by employers, (3) learning as indentured apprentices, (4) learning in trade, technical high, continuation or evening schools and (5) learning in shops and schools according to some co-operative arrangement between industrial establishments and the schools.

Vocational education received its first great stimulation in 1906 when the National Society for the Promotion of Industrial Education was organized for the purpose of extending vocational education throughout the United States. This society was very influential and succeeded within a decade of years in marshalling sufficient legislative support for a national law (the Smith-Hughes Act passed Feb. 23, 1917), fostering and aiding vocational education. Under the terms of this act, Federal financial aid is granted to public schools offering approved vocational, agricultural, home economics and trade and industrial education courses of less than college grade to pupils 14 years of age and older. Support is also given to teacher-training institutions preparing vocational teachers, to civilian rehabilitation training and to special vocational researches. The law gives no aid to commercial education.

The law is administered by a Federal Board for Vocational Education, which includes representatives of labour, agriculture, manufacturing and commerce. This board operates through State boards designated by the respective State legislatures to prepare and develop vocational education programmes which meet with Federal approval. The passage of the act greatly extended vocational education throughout the United States as may be noted from the following table:

Date	Number of reimbursement units	Number of teachers	Number of pupils enrolled	Federal aid
1927 . .	8,696	18,900	784,986	$6,730,305.25
1918 . .	1,741	5,257	164,186	832,426.82
Increase .	6,955	13,643	620,800	5,897,878.43

A significant trend in trade and industrial education is the growing interest in trade apprenticeship. While the old craft apprenticeship no longer exists, there is a very marked increase in the number of indentured apprentices learning trades. Apprenticeship conforming to modern conditions has been best developed in the State of Wisconsin, where it has had a legal status since 1915. Here a contract must be entered into between the employer and the apprentice whenever employment of a minor 16 to 21 years of age is undertaken with the definite understanding that learning the trade is one of the benefits to be conferred upon the employee. In such cases the employer agrees to furnish the practical instruction. The contracts always state what must be taught to the apprentice; how much time is to be given to each unit of instruction; what compensation and bonus, if any, are to be paid, and the length of the apprenticeship. The State industrial commission supervises all apprentice relationships, and no contracts may be broken except by State consent.

Wisconsin's successful experience with this form of trade training may be gleaned from the fact that Milwaukee, the metropolis of the State, with 763 indentured apprentices in Jan. 1922, had 1,532 in Jan. 1926.

The vocational guidance movement has gradually extended until it is now recognized in the United States as a responsibility by nearly all the schools and colleges and many organizations such as the Young Men's and Young Women's Christian Associations, Boy Scouts and Girl Scouts, as well as many business organizations.

VODENA, a city of Greek Macedonia in the province of Pella on the railway from Salonika to Monastir. Pop. about 25,000, consisting of 14% Slavs and 86% Greeks. It is the ancient *Edessa* (*q.v.*). The town stands on a rocky height commanding views of Pindus and Olympus and is the see of an archbishop.

VODEYSHANKAR, GOWRISHANKAR (1805–1892), native minister of the state of Bhaunagar in Kathiawar, Bombay, was born on Aug. 21, 1805, of a family of Nagar Brahmans. He rose from being a revenue officer to be state minister in 1847. His success in this capacity was such that on the death of the reigning chief, in 1870, he was appointed joint administrator in concert with a British official. The experiment was in every respect successful. Gowrishankar received the C.S.I. in 1877. He helped to establish the Rajkumar College at Rajkot, for the education of native princes, and also the Rajasthanik Court, which, after settling innumerable disputes between the land-owning classes and the chiefs, has since been abolished. In 1879 Gowrishankar resigned office, and devoted himself to the study of the Vedanta philosophy which had been his constant solace and guide. In 1884 he wrote a work called *Svarupanusandhan,* on the union of the soul with Deity. He died, much revered, in December 1892.

See Javerital U. Yajnik, *Gowrishankar Udayashankar* (Bombay, 1889).

VODKA, VODKI or **WODKY,** the Russian national spirituous beverage. Originally vodka was made almost entirely from rye, barley malt to the extent of 15 to 20% being used to effect saccharification (*see* SPIRITS), but at the present day potatoes and maize are the staple raw materials from which this spirit is manufactured, and, as a rule, green rye malt is now used instead of barley. During the World War the sale of vodka was prohibited, and after the revolution of Nov. 1917, the soviets made an attempt to enforce general prohibition, but failed.

VOGAN, BORIS ANDREYEVICH: *see* PILNYAK.

VOGEL, SIR JULIUS (1835–1899), British colonial statesman, son of Albert Leopold Vogel, was born in London on Feb. 24, 1835, was educated at University College school, London, and emigrated to Victoria during the exciting years which followed the discovery of goldfields there. He became editor of a newspaper at Maryborough, stood for the Legislative Assembly and was defeated, and in 1861 left Victoria, carried in the mining rush to Otago, New Zealand, where much gold had just been found. Settling in Dunedin, he bought a half-share in the *Otago Daily Times,* and was soon its editor and a member of the Otago Provincial Council. He made his paper the most influential in the colony, and was returned to the House of Representatives. In 1866 he was head of the Otago Provincial Executive; by 1869 he had made his mark in the New Zealand parliament, and was treasurer in the ministry of Sir William Fox. He brought forward schemes for the construction of trunk railways and other public works, the purchase of land from the Maori tribes, and the introduction of immigrants, all to be done with money borrowed in London. For the next six years he was the most powerful man in the colony. In 1875 he was knighted.

In 1874 Vogel, until that time a supporter of the Provincial

system, decided to abolish it. In this, with the aid of Sir E. W. Stafford and Sir H. A. Atkinson, he succeeded. In the struggle, however, he broke with many of his old allies, and in 1876 suddenly quitted New Zealand to take the post of agent-general in London. The last years of his life were spent in England. He died there, at East Molesey, on March 13, 1899.

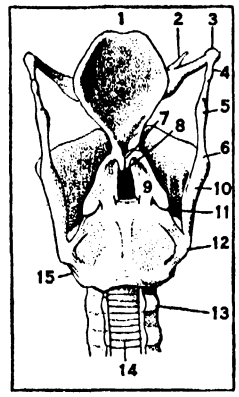
VOGHERA (anc. *Iria*), a town of Lombardy, Italy, in the province of Pavia, and 19 m. by rail S.S.W. of that city, 305 ft. above sea-level, on the Staffora (a tributary of the Po). Pop. (1921) 20,810 (town); 26,069 (commune). It is on the old main line from Genoa to Milan via Novi (though the direct line from Arquata Scrivia to Tortona does not touch it) and a branch diverges here to Piacenza.

VOGLER, GEORG JOSEPH (1749–1814), usually known as Abbé or Abt (Abbot) Vogler, German organist and composer, was born at Pleichach in Würzburg on June 15, 1749. His father, a violin maker, while educating him in the Jesuit college, encouraged his musical talent, and at ten years old he could play the organ, the violin and other instruments. In 1771 he went to Mannheim, where he composed a ballet for the elector Karl Theodor, who sent him to Bologna in 1774 to study under the Padre Martini. He soon left Martini and went to Valotti and Padua for five months, after which he proceeded to Rome. There he became a priest, was admitted to the famous academy of Arcadia and was made a knight of the Golden Spur.

On his return to Mannheim in 1755 Vogler was appointed court chaplain and second "maestro di cappella."

In 1778 the elector removed his court to Munich. Vogler followed in 1780, but presently went to Paris, where his new system was eventually recognized as a continuation of that started by Rameau. His organ concerts at St. Sulpice attracted considerable attention. For the queen, he composed the opera *Le Patriotisme*, which was produced before the court at Versailles. His travels were wide, and extended over Spain, Greece, Armenia, remote districts of Asia and Africa, and even Greenland, in search of uncorrupted forms of national melody. In 1786 he was appointed Kapellmeister to the king of Sweden, founded his second music school at Stockholm, and attained extraordinary celebrity by his performances on an instrument called the "orchestrion"—a species of organ invented by himself. In 1790 he brought this instrument to London, and performed upon it with great effect at the Pantheon, for the concert-room of which he also constructed an organ upon his own principles. The abbé's pedal-playing excited great attention. His most popular pieces were a fugue on themes from the "Hallelujah Chorus," composed after a visit to the Handel festival at Westminster abbey, and *A Musical Picture for the Organ*, by Knecht, containing the imitation of a storm. Browning's poem has made his name familiar. He continued to work hard to the last, and died suddenly of apoplexy at Darmstadt on May 6, 1814.

VOGT, HANS (1890–), German inventor, was born on Sept. 25, 1890, at Wörlitz, Bavaria, Germany. He began his career as an inventor in the sphere of high frequency technology, telephone research and earth current telegraphy. In 1918 he began to collaborate with Joseph Massolle and Dr. Engl, and this led to the formation of the Triergon-Arbeitsgemeinschaft, which aimed at the creation of the speaking film. On Sept. 17, 1922, the first public exhibition of the speaking film was held at the Alhambra in Berlin. The voice is photographed directly on to the film band after conversion of the acoustic oscillations, which are taken with an inertialess microphone (kathodophone), and are changed by a photoelectric cell into light pulsations. Reproduction is effected by an electrostatic telephone with mica membrane (statophone).



VOGTLAND or **VOIGTLAND,** a district of Germany, forming the south-west corner of the Republic of Saxony, and also embracing parts of Thuringia. It is bounded on the north by the former principalities of Reuss, on the south-east by Czechoslovakia, and on the south-west and west by Bavaria. Its character is generally mountainous, and geologically it belongs to the Erzgebirge range. It is extremely rich in mineral ores—silver, copper, lead and bismuth. The name denoted the country governed for the emperor by a *Vogt* (bailiff or steward), and was, in the middle ages, known as *terra advocatorum*.

VOGÜÉ, EUGENE MELCHIOR, COMTE DE (1848–1910), French author, was born at Nice on Feb. 25, 1848. He served in the campaign of 1870, and on the conclusion of the war entered the diplomatic service, being appointed successively attaché to the legations at Constantinople and Cairo and secretary at St. Petersburg (Leningrad). He was almost the first to draw French attention to Dostoievski and his successors. He became a member of the French Academy in 1888. He died in Paris on March 24, 1910.

His works include: *Histoires orientales* (1879); *Portraits du siècle* (1883); *Le Fils de Pierre le Grand* (1884); *Histoires d'hiver* (1885); *Le Roman russe* (1886); *Regards historiques et littéraires* (1892); *Coeurs russes* (1894); *Devant le siècle* (1896); *Jean d'Agrève* (1898); *Le Rappel des ombres* (1900); *Le Maître de la mer* (1903); *Maxime Gorky* (1905).

VOICE is the sound produced by the vibrations of the vocal cords, two ligaments or bands of fibrous elastic tissue situated in the larynx. It is to be distinguished from speech, which is the production of articulate sounds intended to express ideas. (*See* SINGING; and for speech *see* PHONETICS.)

Physiological Anatomy.—The larynx is a valve guarding the entrance to the trachea. In man it is used as the organ of voice. It is situated in the neck, where it forms a well marked prominence in the middle line (*see* details under RESPIRATORY SYSTEM). It consists of a framework of cartilages, connected by elastic membranes or ligaments, and it contains two important structures known as vocal cords. The latter, if brought into apposition can be blown apart by an expiratory blast of air; there is consequently a fall in pressure in the trachea, which allows the cords to come into contact again; repetition of this action allows puffs of air to escape rhythmically from the larynx into the pharynx and out by the mouth or nose with the production of a note.

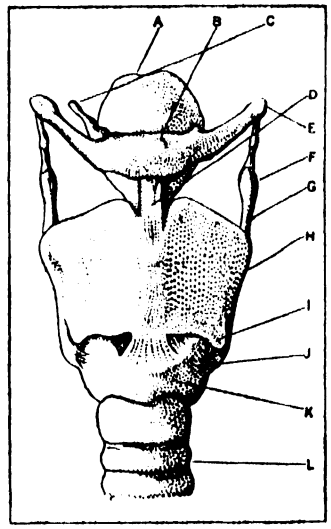

FIG. 1.—CARTILAGES AND LIGAMENTS SEEN FROM BEHIND, ½ NAT. SIZE
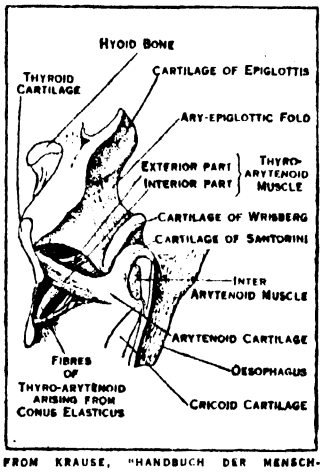
1. Epiglottis; 2. lesser cornu of hyoid bone; 3. greater cornu of hyoid; 4. lateral thyro-hyoid ligament; 5. cartilago triticea; 6. upper cornu of thyroid; 7. thyro-epiglottic ligament; 8. cartilages of Santorini; 9. arytenoid cartilages; 10. left lamina of thyroid; 11. muscular process of arytenoid cartilage; 12. inferior cornu of thyroid; 13. first ring of trachea; 14. posterior membranous wall of trachea; 15. lamina of cricoid cartilage

The *cartilages* form the framework of the larynx. They consist of three single pieces (the thyroid, the cricoid and the cartilage of the epiglottis) and of three pairs (two arytenoids, two cornicula laryngis or cartilages of Santorini, and two cuneiform cartilages or cartilages of Wrisberg), *see* figs. 1 and 2. The epiglottis, the cornicula laryngis, the cuneiform cartilages and the apices of the arytenoids are composed of yellow or elastic fibro-cartilage, whilst the cartilage of all the others is of the hyaline variety, resembling that of the costal or rib cartilages. These cartilages are bound together by ligaments, some of which are seen in figs. 1 and 2, whilst the remainder are represented in fig. 3. The structures specially concerned in the production of voice are the *inferior thyro-arytenoid folds*, or true vocal cords. These are composed of fine elastic fibres attached behind to the anterior projection of the base of the arytenoid cartilages, *processus vocalis*, *see* fig. 3, and in front to the middle of the angle between the wings or laminae of the thyroid cartilage. They are continuous with the lateral cricothyroid ligaments which form the conus elasticus, *see* fig. 3.

The *cavity* of the larynx is divided into an upper and lower portion by the narrow aperture of the *glottis* or chink between the edges of the true vocal cords, the *rima glottidis*. Immediately above the true vocal cords, between these and the false vocal cords, there is on each side a recess or pouch termed the *ventricle* of Morgagni, and opening from each ventricle there is a still smaller recess, the *laryngeal saccule*, which passes for the space of half an inch between the superior vocal cords inside and the

thyroid cartilage outside, reaching as high as the upper border of that cartilage at the side of the epiglottis. The upper aperture of the larynx is bounded in front by the epiglottis, behind by the summits of the arytenoid cartilages and on the sides by two folds of mucous membrane, the aryteno-epiglottic folds.



The *rima glottidis*, between the true vocal cords, in the adult male measures about 23 mm., or nearly an inch from before backwards, and from 6 to 12 mm. across its widest part, according to the degree of dilation. In females and in males before puberty the antero-posterior diameter is about 17 mm. and its transverse diameter about 4 mm. The vocal cords of the adult male are in length about 15 mm., and of the adult female about 11 mm. The larynx is lined with a layer of epithelium, which is closely adherent to underlying structures, more especially over the true vocal cords. The cells of the epithelium, in the greater portion of the larynx, are of the columnar ciliated variety, and by the vibratory action of the cilia mucus is driven upwards, but over the true vocal cords the epithelium is squamous. Numerous mucous glands exist in the lining membrane of the larynx, more especially in the epiglottis. In each laryngeal pouch there are from sixty to seventy such glands.

The Muscles of the Larynx.—We are now in a position to understand the action of the *muscles* of the larynx by which the vocal cords, forming the *rima glottidis*, can be tightened or relaxed, and by which they can be approximated or separated. Besides certain extrinsic muscles—sterno-hyoid, omohyoid, sterno-thyroid and thyro-hyoid—which move the larynx as a whole, there are *intrinsic* muscles which move the cartilages on each other. These muscles are (*a*) the crico-thyroid, (*b*) the posterior crico-arytenoid, (*c*) the lateral crico-arytenoid, (*d*) the thyro-arytenoid, (*e*) the arytenoid, and (*f*) the aryteno-epiglottidean. Their actions will be readily understood with the aid of the diagrams in fig. 5. (1) The *crico-thyroid* is a short thick triangular muscle, its fibres passing from the cricoid cartilage obliquely upwards and outwards to be inserted into the lower border of the thyroid cartilage and to the outer border of its lower horn. When the muscle contracts, the cricoid and thyroid cartilages are approximated. (2) The *thyro-arytenoid* has been divided by anatomists into two parts—one, the internal, lying close to the true vocal cord, and the other, external, immediately within the ala of the thyroid cartilage. Many of the fibres of the anterior portion pass from the thyroid cartilage with a slight curve (concavity inwards) to the processus vocalis at the base of the arytenoid cartilage. They are thus parallel with the true vocal cord, and when they contract the arytenoids are drawn forwards if the postreus muscles are relaxed; but if the arytenoid cartilages are braced back contraction of the muscle increases the elasticity of the margins of the glottis. (3) The *posterior* and *lateral crico-arytenoid* muscles have antagonistic actions, and may be considered together. The *posterior* arise from the posterior surface of the cricoid cartilage, and passing upwards and outwards are attached to the outer angle of the base of the arytenoid. On the other hand, the *lateral* arise from the upper border of the cricoid as far back as the articular surface for the arytenoid, pass backwards and upwards, and are also inserted into the outer angle of the base of the arytenoid before the attachment of the posterior crico-arytenoid. Imagine the pyramidal form of the arytenoid cartilages. To the inner angle of the triangular base are attached, as already described, the true vocal cords; and to the outer angle the two muscles in question. The posterior crico-arytenoids draw the outer angles backwards and inwards, thus rotating the inner angles, or processus vocalis, outwards; the innermost fibres of the muscles draw the arytenoids away from one another and widen the rima glottidis. This action is opposed by the lateral crico-arytenoids, which draw the outer angle forwards and outwards, rotate the inner angles inwards, and thus approximate the cords. (4) The *arytenoids* pass from the one arytenoid cartilage to the other, and in action these cartilages will be approximated and slightly depressed. (5) The *aryteno-epiglottidean* muscles arise near the outer angles of the arytenoid; their fibres pass obliquely upwards, decussate and are inserted partly into the outer and upper border of the opposite cartilage, partly into th

aryteno-epiglottic fold, and partly join the fibres of the thyro-arytenoids. In action they assist in bringing the arytenoids together, whilst they also constrict the upper aperture of the larynx.

The Voice Registers.—The voice may be divided into the lower or chest register, the higher or head register, and the small or falsetto register. In singing, the voice changes in volume and in quality in passing from one register into another. There is remarkable diversity of opinion as to what happens in the larynx when the voice passes through the various registers. There has also been much discussion as to the production of

falsetto tones. In the lower registers the membranous vocal cords vibrate, while the arytenoids remain stationary and in apposition. The whole mass of inferior thyro-arytenoids fold—consisting of mucous membrane, fatty elastic connective tissue and underlying muscle—vibrates. In the falsetto voice the vocal cords are blown apart and the rima glottis is of an elliptical shape; only the margins of the inferior thyro-arytenoid folds vibrate. The small register is a variant of the falsetto; in it only a part of the membranous glottis is blown open.

The pitch of the voice appears to depend on the relation of the elasticity of the glottal margins—as determined by the degree of contraction of the thyro-arytenoid muscles—to the pressure of air expelled from the trachea. The pitch can be raised by an increase of the former while the latter remains almost unchanged or vice-versa; probably an increase of elasticity is accompanied by slightly raised air pressure in the changes of pitch in the chest register. In the head register it appears that the innermost fibres only of the thyro-arytenoid muscles are in contraction, rise of pitch being produced principally by rise of air pressure.

The Laryngoscope.—By means of the laryngoscope it is possible to see the condition of the rima glottidis and the cords in passing through all the ranges of the voice. In 1807 Bozzini first showed that it was possible to see into the dark cavities of the body by illuminating them with a mirror, and in 1829 W. Babington first saw the glottis in this way. In 1854 Garcia investigated his own larynx and that of other singers, and three years later Türck and especially J. N. Czermak, perfected the construction of the laryngoscope. In 1883 Lennox Browne and Emil Behnke obtained photographs of the glottis in the living man. By using the stroboscope Oertel, Musehold, Flatau, Hegener and Panconcelli-Calzia have in recent years enormously improved the technique of laryngoscopy. The endoscope devised by Flatau and the autophonoscope originated jointly by Panconcelli-Calzia enable one to carry out extensive observations on the larynx while the mouth is closed.

Other apparatus employed for investigating the mechanism of the voice includes the breathing flask of Gutzmann, the spirometer, the stethograph and pneumograph (used in connection with the manometer and the phonetic kymograph), all of which are employed for investigating breathing. For observing the action of the vocal cords there are employed, in addition to the laryngoscope, the strobolaryngoscope and the endoscope, manometric flames, the Polsterpfeife of Wethlo, resonators, gramophones, microphones and oscillographs. For studying the supraglottal resonators radiograms are taken.

Action of the Vocal Cords.—The best view of the larynx is obtained with the tongue flat, while attempting to sing the vowel "ee," for this opens out the cavity immediately above the larynx. Now suppose the larynx is examined stroboscopically. The vocal cords are seen to be alternately opening and closing along the ligamentous portions in the chest notes. In falsetto the glottis is permanently open with the edges of the cords vibrating. In whisper the space between the arytenoids is open. Should this occur during phonation, it constitutes a faulty mechanism producing what is called breathy voice, which is particularly to be avoided in singing.

J. Wyllie showed in 1865 that the false vocal cords play the chief part in the closure of the glottis during expiration. Lauder, Brunton and Cash confirmed J. Wyllie's results and further thought that the function of the false vocal cords was to close the glottis and thus fix the thorax for muscular effort. From the evidence of comparative anatomy, and from observations made on men, it has been demonstrated in recent years that in fixation of the thorax, the vocal cords are the important factor. By means of their closure air is prevented from entering the lungs and as the thorax is to a certain extent unable to expand, because of this obstructive mechanism, the ribs tend to come to rest whereby a fixed origin is afforded to the various groups of muscles which move the arms.

The conditions that define the attributes of the human voice are in essentials similar to those of musical instruments in general. The source of energy is the lungs. By them the air is forced under pressure through the glottis causing the vocal cords to move rhythmically, thereby producing a musical note. This musical note is a tone-complex of simple harmonic vibrations some of which are modified by the supraglottal cavities acting as resonators. It is the train of sound waves thus modified, issuing from the mouth, which gives rise to those elements of speech termed vowels and voiced consonants. Such sound waves can be, and sometimes are produced to a limited extent by an in-drawn current of air actuating the vocal cords.

To what extent the infraglottal cavities, *e.g.*, the trachea and chest cavity, influence the quality of the glottal note has not been determined, but they certainly do affect it. Investigators are however agreed that among the supraglottal cavities the effect of the sinuses, *e.g.*, the maxillary sinus, the ethmoidal cells, sphenoidal sinus and frontal sinus, is negligible owing to their small size, unfavorable positions, and minute openings. The expression "sinus tone production" would thus appear to be devoid of justification. Nor can there be any question of directing the voice to a definite point in the buccal cavity, as the dimensions of the mouth cavity, in comparison with the wave-length of sound, are too small for reflexion to be possible.

Attributes of Voice.—Voice may be defined in terms of certain attributes, *i.e.*, (1) duration, (2) pitch, (3) quality or timbre, (4) loudness.

Duration.—The duration of voice in vowels varies with the speed of utterance. In words of two or more syllables, results show that for English spoken at an average speed, the duration of so-called short vowels may vary from ·047 to ·095 of a second, while that of so-called long vowels may vary from ·12 to ·255 of a second.

Pitch.—The pitch of the glottal note, *i.e.*, the lowest tone of the complex, is determined by the frequency, or number of cycles the vocal cords execute in one second, frequency and pitch being physical and sensory aspects of the same thing. The conditions determining pitch are the mass, length and elasticity of the cords, and the pressure actuating them. Increase of pressure in the expiratory current leads to a raising of pitch, but the pitch of the resonance cavities appears to have no effect on the pitch of the glottal note.

The vocal cords are tightened if the arytenoid cartilages be braced back by contraction of the crico-thyroid, and posterior thyro-arytenoids will then give elasticity to the margins of the glottis so that they will recoil after being blown apart. The greater the degree of contraction the higher will this elasticity become. All the muscles except the thyro-cricoid (which is inervated by the superior laryngeal) receive nerve filaments from the inferior laryngeal branch of the vagus, the fibres being derived from the accessory roots. Both the abductor and adductor nerves come therefore from the inferior laryngeal.

In men, by the development of the larynx the cords become more elongated than in women, in the ratio of 3 to 2, so that the male voice is of lower pitch and is usually stronger. At the age of puberty the larynx grows rapidly, and the voice of a boy breaks in consequence of the lengthening of the cords, generally falling an octave or so in pitch. A similar change but less in amount occurs at the same time in the female.

The pitch compass of the human voice generally ranges from E to c′ (80 ~ to 320 ~) in Bass voices and c to a″ (256 ~ to 853 ~ in Soprano voices. (The sign ~ is used to denote the number of cycles a second. This unit is sometimes called a "hertz" after the great German physicist.) These limits are greatly exceeded by many singers. Réthi and Fröschels report the abnormal case of a singer with a compass of five octaves, i.e., F (42 ~) to f‴ (1,408 ~).

Timbre.—As has already been stated above, the voice is composed of a fundamental and a series of over-tones in harmonic relation to it. The quality or timbre is determined by the relative strength of these overtones. The phase relationship between them appears to be of little importance for quality. Difference between vowels is essentially a difference of quality. Thus when speaking the vowel [a] certain partials in the region g″ (767 ~) and d‴′ (1,147 ~) receive preferential treatment from the supra-

glottal cavities while the prominent partials in [i] are in the region f′ (342~) and f′′′′ (1,579~).

The decay in intelligibility of vowels on the suppression of certain partials, has been investigated by Stumpf and Fletcher. A quotation from the latter relating to this is illuminating. Incidentally it shows also that the fundamental may be only subjective. "The vowel 'ah' sung on a pitch d′ (145~) is affected only slightly in either pitch or quality when the fundamental and first two overtones are eliminated. Even with the fundamental and first six overtones eliminated, the pitch still very definitely corresponds to the pitch of a pure tone with the frequency of the fundamental, namely, 145~. The harmonic analysis of this filtered tone shows no frequencies below 1,000~. Eliminating all the overtones above the sixth changes the quality by about the same amount as eliminating the fundamental and first and second overtones. The data also indicate that if the fundamental and all of the upper and lower harmonics except the third, fourth and fifth, are eliminated, the remaining compound tone has the same pitch as the fundamental, although the quality of the sound is very different from that of the sound 'ah.'" A rich baritone or contralto appears to be affected neither in pitch nor in quality by eliminating the fundamental and first two or three overtones. The filtering out of higher partials, even of those above the 15th, however, noticeably affects the musical quality of the voice. High harmonics do not appear to be so essential to good quality in sopranos, as in bass, baritone and contralto.

Loudness.—Loudness, which is the sensory relation to the physical property of intensity, depends on the energy in its various component partials. The rate of energy output in the case of an ordinary voice is extremely small, being about 125 ergs per second, *i.e.*, less than a fiftieth of a millionth of a horse-power. Loudness is a function of pitch and the amplitude of the movements of the vocal cords. If the response of the ear were of a linear character, the intensity of the auditory impressions would be proportional to the square of the product of the amplitude and pitch, to which the term "physiological intensity" has been applied. But at intensities considerably above minimum audibility, there is no proportionality between sound pressure and aural response, for effects are produced in the ear which are not present in the voice which excites them. This degree of non-linearity varies with different persons. Moreover there occurs a masking of one tone by another. A loud tone of low pitch can obscure a weak high tone, but an intense high tone has but little masking effect on low ones.

Methods of Investigation.—Among the methods and apparatus for investigating the attributes of voice, the following may be mentioned. For *duration* and *pitch*, a phonetic kymograph with tambours and an electrically-driven tuning fork of 100~ are the instruments generally employed. *Relative loudness* can also be investigated by these, although electric methods of measuring the energy output are far more effective.

For the investigation of quality, methods may be classified under three heads according to the apparatus employed. (a) *Those using resonators for picking out the component partials.* Helmholtz (1862) determined the maximal response (subjectively) by the ear. König (1868) employing his manometric flames in conjunction with resonators, showed the response objectively. Resonators in conjunction with a hot-wire microphone have been employed by Tucker and Paris (1921). Garten (1921) used a variable resonator where maximal response was registered on a soap-film recorder. Stumpf (1922) used tuning forks as resonators. (b) *Those depending on subjective observations on the changes of quality which the voice undergoes when certain tones are eliminated.* Stumpf employed interference tubes, while Fletcher, Crandall, Wegel, and others, have used the electric wave filter invented by Dr. Campbell for cutting out frequencies. (c) *For objective measurements of quality*, curve-tracings or oscillograms of air vibrations produced by the voice are obtained. They are then submitted to harmonic analysis to obtain the component partials. Several instruments have been devised. Those used by the Bell Telephone Laboratories and research laboratories of the American Telephone Company in their magnificent work on speech should be first mentioned. F. Trendelenburg used the "condenser microphone" of Riegger. Miller in his "phonodeik" used a glass membrane. The "cathode-ray oscillograph" and "Hilger's audiometer" should also be mentioned. Hermann and Scripture in their researches enlarged the curves of phonograph and gramophone records.

"Sonance."—The beauty of the voice is mainly determined by its quality, but there is another condition which influences the artistic effectiveness of it. Metfessel, of the University of Iowa, has examined minutely records of songs sung by some famous singers, and has found in every case a certain periodic departure from true pitch, accompanied by a periodic change in amplitude. There is every reason to suppose that much of the aesthetic value of a great singer's voice is attributable to these fluctuations, on the principle that art consists of rhythmic deviations from regularity. To the perceptive fusion of the successive changes in tone-attributes, Metfessel has given the name "sonance." Popular appreciation of voice-quality in singers, denoted by the term "quality," is as Metfessel states, a combination of "quality or timbre" and "sonance" although the two things should not be confused.

Substitutes for the Larynx.—Laryngectomized subjects have been known to develop a capacity for producing sounds which in essentials resemble normal voice. Burger and Kaiser of Amsterdam report a case where a pseudo-larynx has been developed in the oesophagus. The vicarious lung was the stomach, and the lips of the pseudo-glottis were actuated by ejecting air which had previously been swallowed. It is reported that the subject could sing, speak and use the telephone. Indeed, vocally, he carried on like a normal person.

Attempts have also been made with more or less success to supply the voice element in speech by means of vibrating reeds of rubber or thin metal. The best known of these devices is the "MacKenty-Western Electric Artificial Larynx." By using it the subject is able to direct the expiratory current on to a rubber reed when voicing is required.

VOICE SOUNDS, sound made by the human voice, which—as used in English and other European speech—can be produced in two different forms, namely (*a*) unvoiced, *i.e.*, breathed or whispered speech, and (*b*) voiced speech.

In unvoiced speech the vocal chords are more or less separated so that the air from the lungs passes continuously between them. In voiced speech the vocal chords are brought closely together so that the forcible passage of the air between them sets up a rhythmical vibration of the chords which causes the air to enter the vocal cavities in correspondingly rhythmical puffs.

Vowel Sounds.—Until recently the accepted theory was that sounds like i as in eat, ɛ as in men, æ as in hat, were each due to two separate resonances, that a as in calm, was produced in some voices by a single resonance, and in others by two resonances, and that ɔ as in all, ou as in no, u as in who, were all due to single resonance (1). According to Helmholtz's theory (2) the lower series of double resonances is set up in the cavity behind the tongue, and the upper in a tubular neck formed by the tongue and

lips, while in the case of the single resonant sounds, the whole oral cavity is supposed to act as a single resonator. Graham Bell, the inventor of the telephone, and K. J. Lloyd, both held that all vowel sounds were due to double resonance (3).

Recent observations (4) have confirmed the views of Graham Bell and Lloyd, and shown that all the English vowel sounds depend primarily on two characteristic resonances—the one formed in the cavity in front of the tongue—*i.e.*, between the point of nearest approach of the tongue to the palate and the lips—and the other in the cavity behind the tongue—*i.e.*, between the same point and the vocal chords. Both cavities behave as Helmholtz resonators connected in series. Each can be independently tuned, by varying its capacity or by varying the size of its orifice to air and (or) to the adjoining resonator. Increase of capacity lowers the resonant pitch; of orifice raises it.

The following table shows typical resonances observed by ear in the whispered vowel sounds of the writer's voice, using the Southern English "Public School" pronunciation.

Vowel Resonances

Vowel Symbol	As in	Upper Resonance	Lower Resonance	Vowel Symbol	As in	Upper Resonance	Lower Resonance
i	eat	♯d′′′′ 2,434	f′ 342	ʌ	up	♯g′′′ 1,625	♯a′′ 912
ɪ	it	♯e′′′′ 2,169	♯f′ 362	a	calm	♯d′′′ 1,217	♯g′′ 812
ei	hay	♯e′′′′ 2,169	d′′ 574	ɒ	not	♯e′′′ 1,084	♯g′′ 812
ɛ	men	e′′′′ 2,048	♯d′′ 608	ɔ	all	b′′ 966	♯f′′ 724
æ	hat	a′′′ 1,722	♯g′′ 812	ov	know	♯a′′ 912	b′ 483
ə	earth	♯g′′′ 1,625	e′′ 645	u	who	♯f′′ 724	♯f′ 362
ɔ	sofa	g′′′ 1,534	e′′ 645	v	put	♯a′′ 912	♯d′ 304

The resonances are given in musical notation and in number of complete vibrations per second (c′ = middle c on the pianoforte, about 256 vibrations per second). In the series from ə to v inclusive, an additional high frequency component between 2,169 and 2,732 appears. The upper resonance of i to ov can be varied over a range of 5 to 8 semitones, and u and v by 10 semitones, while the lower resonances can all be similarly varied over a range of about 8 semitones (the other resonance, in each case, being kept nearly constant) without losing the vowel character. Comparable resonances have been found—using purely instrument methods—by Crandall and Sacia (5).

ARTIFICIAL PRODUCTION OF VOWEL SOUNDS

Potter (6) experimentally reproduced the English vowel sounds by a reed attached to a spherical indiarubber resonator of suitable aperture which was appropriately compressed (while sounding the reed) so as to produce approximately the form of the human mouth cavity. All the English vowel sounds have recently been produced by combining two suitably tuned Helmholtz resonators in series and energising them by a continuous current of air, for unvoiced sound, or by a pulsating current produced by a vibrating reed or equivalent for voiced sounds (7). The material of the resonators does not appreciably affect the vowel character. The additional high resonances are of secondary importance, since recognisable reproduction may be made without them. Artificial vowels have also been produced by J. Q. Stewart (8) and by Dr. Eccles (9), substituting electrical resonating circuits for acoustic resonators.

Diphthongs differ only from vowels in that their resonances change progressively from those of the initial to those of the terminal vowel which together form the diphthong. They can be reproduced by resonators of progressively variable pitch. Consonants also are produced in speech by resonance in the vocal cavities (10) (11). They differ from the vowel in that 1. they depend essentially on more than two resonances—due to the functioning of more than two cavities; 2. they depend (like the diphthongs) on characteristic movements of the vocal organs which produce corresponding changes of resonance and of amplitude (loudness); 3. the orifices of the resonators (or some of them) are more constricted than those in the case of the vowels, or are temporarily closed altogether, and suddenly released as in forming the so-called plosives, p, b, t, d, k, g and the nasal consonants m, n and ŋ (ng); 4. the resonators are not always in series with the air current which energises them. Thus they may be in parallel—as when the air is passed simultaneously through both mouth and nose; or a resonator may be lateral to the air current, as when passage through the mouth is closed by the tongue or lips and the air passes behind the soft palate into the nasal cavity and out at the nostrils. In such cases the air current flows past the inner orifice of a lateral single-orificed resonator formed inside the mouth. Closure of the tongue against the back or the front of the palate produces a lateral resonator of high or medium pitch characteristic of the nasal consonants ŋ (ng as in hung); closure of the lips produces a lateral resonator of the maximum capacity and lowest pitch, characteristic of m.

The consonants can be artificially produced, like the vowels and diphthongs, by passing air (vibrating or not as the case may be) through resonators of variable number and capacity and (or) orifice (10). In the cheirophone the variable multiple resonator is formed by the hands of the operator, so as to produce recognisable sentences (12). (*See* SOUND.) Certain consonants have also been reproduced by electrical resonance (8).

In the natural production of vowel sounds, the soft palate may be closed against the back of the throat so as to close the passage to the nasal cavity, or it may be drawn forward so as to open that passage more or less. The best quality of voice production appears to be obtained by avoiding nasal resonance, except in connection with the nasal consonants m, n, and ŋ (ng). In the French nasal vowels ɛ̃ (pain), ã (temps), ɔ̃ (bon), œ̃ (un) the nasal resonance is characteristic. The so-called nasal quality heard in English speech in parts of the North American continent appears mainly to depend on the formation of an additional resonator of high pitch by (unconscious) constriction of the pharynx (13). Broadly speaking, the voice sounds of human speech are due to characteristic postures (for vowel sounds) and gestures (for diphthongs and consonants) of the vocal organs—the tongue, lips and soft palate.

The function of the larynx, in voiced speech, is to increase the range of audibility (from about 10 to 20 times) by increasing the resonance of the cavities through or past which the air current flows. It also gives to speech the power of inflection—*i.e.*, of variation of the musical pitch of the voice, as in song. The unvoiced consonants s, ʃ (sh), f, and θ (th as in thigh) and the unvoiced aspirate, all of which carry no laryngeal energy and are incapable of emotional or musical inflexion, are inferior to all other voice sounds. (*See* SINGING.) *See* also VOICE; PHONETICS; PHILOLOGY; PHARYNX, and RESPIRATORY SYSTEM.

VOILE, a term applied to a distinctive type of fabrics comprising a variety of different textures produced from wool, cotton and silk, and possessing the same general features. It is characterized by a light, open and net-like structure based essentially on the principle of the plain calico weave, and produced from warp and weft yarns with an abnormal degree of twist, irrespective of the class of material from which it is spun. The yarn employed may be either single or folded in the warp series or in the weft series, or in both series of threads; and it may be spun with a greater or lesser amount of twist. (*See* also *Voile* under COTTON: *Varieties of Cotton Fabrics.*)

VOIRON, a town of France in the department of the Isère. Pop. (1926) 8,985. It stands at a height of 950 ft., on the Morge (a tributary of the Isère). Voiron long formed part of Savoy,

but in 1355 was exchanged (with the rest of the region between the Rhone and the Isère, watered by the Guiers Mort) by the count with France for Faucigny and Gex.

VOIVODE, a title in use among certain Slavonic peoples, meaning literally "leader of an army" (Sl. *voi,* host, army; *voiditi,* to lead); also *Vaivode, Vayvode, Wayvode,* etc., Med. Gr. *boebodos,* and so applied at various periods and in various eastern European countries to rulers, governors or officials of varying degree. It is best known as the title of the princes of Moldavia and Walachia. In Poland the title (which appears in history as palatinus) is still used of certain administrative officials. A province of northern Yugoslavia is known as the "Voivodina."

VOLAPÜK: *see* UNIVERSAL LANGUAGE.

VOLCAE, an ancient Celtic people in the province of Gallia Narbonensis, who occupied the district between the Garumna (Garonne), Cerbenna mons (Cévennes), and the Rhodanus, corresponding roughly to the old province of Languedoc. They were divided into the Arecomici on the east and the Tectosages on the west, separated by the river Arauris (Hérault). The Volcae were free and independent, had their own laws, and possessed the *ius Latii.* The chief town of the Tectosages was Tolosa (Toulouse); of the Arecomici, Nemausus (Nîmes); the capital of the province was Narbo Martius (Narbonne).

BIBLIOGRAPHY.—*See* A. Holder, *Altceltischer Sprachschatz,* i. ii. (1896, 1904), s.vv. "Arecomici" and "Tectosagi"; T. R. Holmes, *Caesar's Conquest of Gaul* (1899) p. 513.

VOLCANO, an opening in the earth's crust, through which heated matter is brought to the surface, where it usually forms a hill, more or less conical in shape, and generally with a hollow or crater at the top. This hill, though not an essential part of the volcanic mechanism, is what is commonly called the volcano. The name seems to have been applied originally to Etna and some of the Lipari Islands, which were regarded as the seats of Hephaestus, a Greek divinity identified with Vulcan, the god of fire in Roman mythology. All the phenomena connected with volcanic activity are comprised under the general designation of *vulcanism* or *vulcanicity;* whilst the study of the phenomena forms a department of natural knowledge known as *vulcanology.*

Volcanic Phenomena.—A volcanic eruption is usually preceded by certain symptoms, of which the most common are local earthquakes, subterranean noises, changes in the flow and temperature of springs and evolution of various gases in and near the crater. Where a crater has been occupied by water, forming a crater-lake, the water becomes warm, and may even boil.

Emission of Vapour.—Of all volcanic phenomena the most constant is the emission of vapour. It is one of the earliest features of an eruption; it persists during the paroxysms, attaining often to prodigious volume; and it lingers as the last relic of an outburst. The well-known "pine-tree appendage" of Vesuvius (*pino vulcanico*), noted by the younger Pliny in his first letter to Tacitus on the eruption in A.D. 79, is a vertical shaft of vapour terminating upwards in a canopy of cloud, and compared popularly with the trunk and spreading branches of the stone-pine. During the eruption of Vesuvius in April 1906 the steam and dust rose to a height of from 6 to 8 miles, while at Krakatoa in 1883 the column reached an altitude of nearly 20 miles.

Volcanic Rain and Mud.—The steam given out from the crater soon condenses to rain which mixes with the ashes and loose material to form mud, which may rush down the cone and spread far and wide. Herculaneum was buried beneatn a flood of mud swept down from Vesuvius during the eruption of 79, and the hard crust which thus sealed up the city came in turn to be covered by lava-flows from subsequent eruptions.

It sometimes happens that volcanic mud is formed by the mingling of hot ashes not directly with rain but with water from streams and lakes, or even, as in Iceland, with melted snow. A torrent of mud was one of the earliest symptoms of the violent eruption of Mont Pelée in Martinique in 1902.

Ejected Blocks.—When a volcano after a long period of repose starts into fresh activity, the materials which have accumulated in the crater are ejected, often mixed with blocks from the walls of the volcanic pipe, or from the older rocks on which the volcano stands. Masses of limestone ejected from Somma are scattered through the tuffs on the slopes of Vesuvius and contain many interesting minerals due to heating of the limestone. Similarly at Etna blocks of sandstone are changed to quartzite. A rock consisting of an aggregation of coarse ejected materials, including many large blocks, is known as a "volcanic agglomerate."

Cinders, Ashes and Dust.—After the throat of a volcano has been cleared out and a free exit established, the copious discharge of vapour is generally accompanied by the ejection of fresh lava in a fragmentary condition. If the ejected masses bear obvious resemblance to the products of the hearth and the furnace, they are known as "cinders" or "scoriae," whilst the small cinders not larger than walnuts often pass under their Italian name of "lapilli" (*q.v.*). When of globular or ellipsoidal form, the ejected masses are known as "bombs" (*q.v.*); if the lava has become granulated it is termed "volcanic sand"; when in a finer state of division it is called ash, or if yet more highly comminuted it is classed as dust; but the latter terms are sometimes used interchangeably. After an eruption the country for miles around the volcano may be covered with a coating of fine ash or dust, sometimes nearly white, like a fall of snow, but often greyish, looking rather like Portland cement; this dust insinuates itself into every crack and cranny, reaching the interior of houses even when windows and doors are closed. A heavy fall of ash or cinders may cause great structural damage, crushing the roofs of buildings by sheer weight, as was markedly the case at Ottajano and San Giuseppe during the eruption of Vesuvius in April 1906. On this occasion the dry ashes slipped down the sides of the volcanic cone like an avalanche, forming great ash-slides with ridges and furrows rather like barrancos, or ravines, caused by rain. The burial of Ottajano and San Giuseppe in 1906 by Vesuvian ejecta, mostly lapilli, has been compared with that of Pompeii in 79.

Lava.—The volcanic cinders, sand, ashes and dust described above are but varied forms of solidified lava, which is the most characteristic product of volcanic activity. It is composed of various silicates, or their constituents, in a state of mutual solution, and heavily charged with certain vapours or gases, principally water-vapour, superheated and under pressure. The lava differs from the magma before eruption, inasmuch as water and various volatile substances may be expelled on extrusion.

The rapidity of a lava flow is determined partly by the slope of the bed over which it moves and partly by the consistency of the lava, this being dependent on its chemical composition and on the conditions of cooling. In an eruption of Mauna Loa, in Hawaii, in 1855, the lava was estimated to flow at a rate of 40 m. an hour; and at an eruption of Vesuvius in 1805 a velocity of more than 50 m. an hour, at the moment of emission, was recorded. The rapidity of flow is, however, rapidly checked as the stream advances, the retardation being very marked in small flows. Where lava travels down a steep incline there is naturally a great tendency to form a rugged surface, whilst a quiet flow over a flat plane favours smoothness. If the lava meet a precipice it may form a cascade of great beauty.

If, after a stream of lava has become crusted over, the underlying magma should flow away, a long cavern or tunnel may be formed. Should the flow be rapid the roof may collapse and the fragments, falling on to the stream, may be carried forward or become absorbed in the fused mass. The walls and roof of a lava-cave are occasionally adorned with stalactites, whilst the floor may be covered with stalagmitic deposits of lava. The volcanic stalactites are slender, tubular bodies, extremely fragile, often knotted and rippled. Beautiful examples of lava stalactites from Hawaii have been described by Prof. E. S. Dana.

Physical Structure of Lavas.—An amorphous vitreous mass may result from the rapid cooling of a lava on its extrusion from the volcanic vent. The common type of volcanic glass is known as obsidian (*q.v.*). In many cases the lava brings up myriads of crystals that have been developed during slow solidification in the heart of the volcano. Showers of crystals of leucite have occurred at Vesuvius, of anorthoclase at Mt. Erebus, of labradorite at Etna and of pyroxene at Vesuvius, Etna and Stromboli. These

"intratelluric crystals" were floating in the molten magma, and had they remained in suspension, this magma would have enveloped them as a ground-mass or base. A rock so formed is generally known as a "porphyry," and the structure as porphyritic. In such a lava the large crystals, or phenocrysts, represent an early phase of consolidation and the minerals of the matrix a later stage. For a discussion of the chemical and mineralogical composition of lavas *see* PETROLOGY.

In the course of the life of a volcano the lava which it emits may vary within moderate limits, being at one time more acid at another more basic. Such changes are sometimes connected with a shifting of the axis of eruption. Thus at Etna the lavas from the old axis of Trifoglietto in the Val del Bove were andesites, with about 55% of silica, but those rising in the present conduit are basaltic, with a silica-content of only about 50%. Other instances could be given.

Capillary Lava.—A filamentous form of lava well known at Kilauea, in Hawaii, is termed *Pele's hair,* after Pele, the goddess of the Hawaiian volcanoes. It resembles the artificial material known as "slag wool"—a material formed by injecting steam into molten slag from a blast-furnace.

Pumiceous Lava.—The copious disengagement of vapour in a glassy lava gives rise to the light cellular or spongy substance, full of microscopic pores, known as pumice (*q.v.*). It is usually, though not invariably, produced from an acid lava, and may be regarded as the solidified foam of an obsidian. During the eruption of Krakatoa in 1883 enormous quantities of pumice were ejected, and were carried by the sea to vast distances, until they ultimately became water-logged and sank. Professor Judd found the pumice to consist of a vitreous lava greatly inflated by imprisoned vapours.

Water in Lavas.—Whether an eruption is of an explosive or a tranquil character must depend largely, though not wholly, on the chemical composition of the magma, especially on the water-content. By relief of pressure on the rise of the column in the volcanic channel, or otherwise, more or less steam will be disengaged, and if in large quantity this must become, with other vapours, a projectile agency of enormous power. The precise physical condition in which water exists in the magma is a matter of speculation.

Volcanic Vapours.—It seems not unlikely that the vapours and gases exist in the volcanic magma in much the same way that they can exist in molten metal. It appears that many igneous rocks contain gases locked up in their pores, not set free by pulverization, yet capable of expulsion by strong heat. The gases in rocks have been the subject of elaborate study by R. T. Chamberlin, whose results appear in publication No. 106 of the Carnegie Institution of Washington.

After the surface of a lava-stream has become crusted over, vapour may still be evolved in the interior of the mass, and in seeking release may elevate or even pierce the crust. Small cones may thus be thrown up on a lava-flow, and when vapour escapes from terminal or lateral orifices they are known as "spiracles." The steam may issue with sufficient force to toss up the lava in little fountains. When the lava is very liquid, as in the Hawaiian volcanoes, it may after projection from the blow-hole fall back in drops and plastic clots, which on consolidation form, by their union, small cones.

Vapour-vents connected with volcanoes are often known as fumaroles (*q.v.*). (*See* also GEYSER and SOLFATARA.)

In some volcanoes much sulphur, formed by a reaction between sulphuretted hydrogen and sulphur dioxide, is deposited. Chlorides also are sometimes formed in considerable quantity, especially ammonium chloride and common salt. The presence of various metallic chlorides and sulphides has often been observed. The pale flames sometimes seen in craters are due to the burning of hydrogen and various hydrocarbons, this being the only true combustion connected with vulcanicity: it is quite unimportant.

The Dust Cloud of Mt. Pelée.—The eruptions in Martinique and St. Vincent in the West Indies in 1902 furnished examples of a type of activity not previously recognized by vulcanologists, though, as Professor A. Lacroix has pointed out, similar phenomena have no doubt occurred elsewhere, especially in the Azores. By Dr. Tempest Anderson and Sir J. S. Flett, who were commissioned by the Royal Society to report on the phenomena, this type of explosive eruption is distinguished as the "Peléan type." Its distinctive character is found in the sudden emission of a dense black cloud of superheated and suffocating gases, heavily charged with incandescent dust, moving with great velocity and accompanied by the discharge of immense volumes of volcanic sand, which are not rained down in the normal manner but descend like a hot avalanche. In its typical form, the cloud at Pelée appeared as a solid bank, opaque and impenetrable, but having the edge in places hanging like folds of a curtain, and apparently of brown or purplish colour. Rolling along like an inky torrent, it produced in its passage intense darkness, relieved by vivid lightning. After leaving the crater, it underwent enormous expansion, and Anderson and Flett were led to suggest that possibly at the moment of emission it might have been partly in the form of liquid drops, which on solidifying evolved large volumes of gas held previously in occlusion. The deadly effect of the blast seems to have been mostly due to the irritation of the mucous membrane of the respiratory passages by the fine hot dust—a serious aggravation of the calamity.

Forms of Volcanoes.—Those volcanic products which are solid when ejected, or which solidify after extrusion, tend to form by their accumulation around the eruptive vent a hill, which, though generally more or less conical, is subject to much variation in shape. It occasionally happens that the hill is composed wholly of ejected blocks, not themselves of volcanic origin. This rather exceptional type is represented in the Eifel by certain monticules which consist of fragments of altered Devonian slate.

In the ordinary paroxysmal type of eruption, however, cinders and ashes are shot upwards by the explosion and then descend in showers, forming around the orifice a mound, in shape rather like the diminutive cone of sand in the lower lobe of an hour-glass, Little cinder-cones of this character may be formed within the crater of a large volcano during a single eruption; whilst large cones are built up by many successive discharges, each sheet of fragmentary material mantling more or less regularly round the preceding layer. The symmetry of the hill is not infrequently affected by disturbing influences—a strong wind, for example, blowing the loose matter towards one side. The sides of a cinder cone have generally a steep slope, varying from 30° to 45°, depending on the angle of repose of the ejectamenta. Excellent examples of small scoria-cones are found among the puys of Auvergne in central France, whilst a magnificent illustration of this type of hill is furnished by Fuji-san, in Japan, which reaches an altitude of 12,000 ft. How such a cone may be rapidly built up was well shown by the formation of Monte Nuovo, near Pozzuoli—a hill 400 ft. high and 1½ m. in circumference, which is known from contemporary evidence to have been formed in the course of a few days in Sept. 1538.

Lava-cones are built up of streams of lava which have consolidated around the funnel of escape. Associated with the lava, however, there is usually more or less fragmentary matter, so that the cones are composite in structure and consequently more acute in shape than if they were composed wholly of lava. As the streams of lava in a volcano run at different times in different directions, they radiate from the centre, or flow from lateral or eccentric orifices, as irregular tongues, and do not generally form continuous sheets covering the mountain. When lava is the sole or chief element in the cone, the shape of the hill is determined to a great extent by the viscosity of the lava, its copiousness and the rapidity of flow. If the lava be highly basic and very mobile, it may spread to a great distance before solidifying, and thus form a hill covering a large area and rising perhaps to a great height, but remarkably flat in profile. Were the lava perfectly liquid, it would indeed form a sheet without any perceptible slope of surface. As a matter of fact, some lavas are so fluent as to run down an incline of 1°, and flat cones of basalt have in some cases a slope of only 10° or even less. The colossal mass of Mauna Loa, in Hawaii, forms a remarkably flat broad cone, spreading over a base of enormous area and rising 13,900 feet.

If the lava be less basic and less fusible, the hill formed by its

accumulation instead of being a low dome will take the shape of a cone with sides of higher gradient; in the case of andesite cones, for instance, the slope may vary from 25° to 35°. Acid rocks, or those rich in silica, such as rhyolites and trachytes, may be emitted as very viscous lavas tending to form dome-shaped or bulbous masses.

The Spine of Pelée.—A peculiar volcanic structure appeared at Mont Pelée in the course of the eruption of 1902, and was the subject of careful study by Professor A. Lacroix, Dr. E. O. Hovey, A. Heilprin and other observers. It appears that from fissures in the floor of the Étang Sec a viscous andesitic lava, partly quartziferous, was poured forth and rapidly solidified superficially, forming a dome-shaped mass invested by a crust or carapace. According to Lacroix, the crust soon became fractured, partly by shrinkage on consolidation and partly by internal tension, and the dome grew rapidly by injection of molten matter. Then there gradually rose from the dome a huge monolith or needle, forming a terminal spine, which in the course of its existence varied in shape and height, having been at its maximum in July 1903, when its absolute height was about 5,276 ft. above sea-level. The walls of the spine, inclined at from 75° to 90° to the horizon, were apparently slickensided, or polished and scratched by friction; masses were occasionally detached and vapours escaped.

The Crater.—The eruptive orifice in a normal volcano—the *bocca* of Italian vulcanologists—is usually situated at the bottom of a depression or cup, known as the crater. This hollow is formed and kept open by the explosive force of the elastic vapours, and when the volcano becomes dormant or extinct it may be closed, partly by rock falling from its crumbling walls and partly by the solidification of the lava which it may contain. If a renewed outburst occurs, the floor of the old crater may reopen or a new outlet may be formed at some weak point on the side of the mountain; hence a crater may, with regard to position, be either terminal or lateral. The position of the crater will evidently be also changed on any shifting of the general axis of eruption. Vesuvius suffered a reduction of several hundred feet during the great eruption of 1906, the east side of the cone having lost, according to V. R. Matteucci, nearly 400 feet.

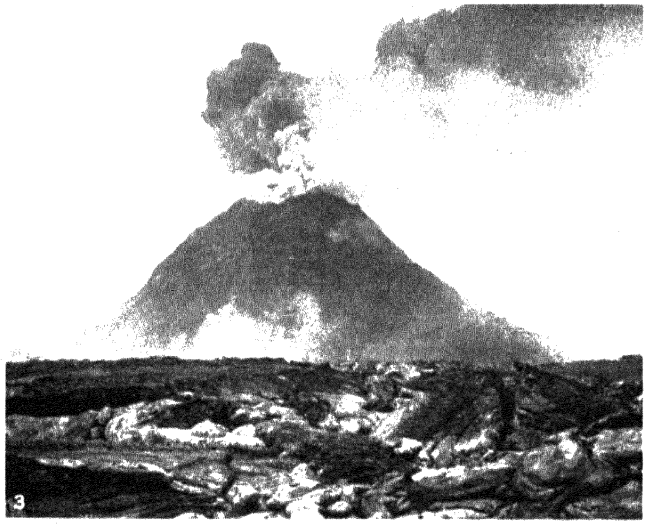
Whilst in many cases the crater is a comparatively small circular hollow around the orifice of discharge, it forms in others a large bowl-like cavity, such as is termed in some localities a "caldera." In Hawaii the craters are wide pits bounded by nearly vertical walls, showing stratified and terraced lavas and floored by a great plain of black basalt, sometimes with lakes of molten lava. Prof. W. H. Pickering compares the lava-pits of Hawaii to the crater-rings in the moon. Some of the pit-craters here are of great size, but none comparable with the greatest of the lunar craters. Dr. G. K. Gilbert, however, has suggested that the ring-shaped pits on the moon are not of volcanic origin, but are depressions formed by the impact of meteorites. Similarly the "crater" of Coon Butte, near Canyon Diablo, in Arizona, which is 4,000 ft. in diameter and 500 ft. deep, has been regarded as a vast pit due to collision of a meteorite of prodigious size. Probably the largest terrestrial volcanic crater is that of Aso-san, in the isle of Kiushiu (Japan), which is a huge oval depression estimated by some observers to have an area of at least 100 sq.m.

On the floor of the crater ejected matter may accumulate as a conoidal pile; and if such action be repeated in the crater of the new cone, a succession of concentric cones will ultimately be formed. The walls of a perfect crater form a ring, giving the cone a truncated appearance, but the ring may suffer more or less destruction in the course of the history of the mountain. A familiar instance of such change is afforded by Vesuvius. The mountain now so called, using the term in a restricted sense, is a huge composite cone built up within an old crateral hollow, the walls of which still rise as an encircling rampart on the N. and N.E. sides, and are known as Monte Somma; but the S. and S.W. sides of the ancient crater have disappeared, having been blown away during some former outburst, probably the eruption of 79.

Much of the fragmental matter ejected from a volcano rolls down the inside of the crater, forming beds of tuff which incline towards the central axis, or have a centroclinal dip. On the contrary, the sheets of cinder and lava which form the bulk of the cone slope away from the axis, or have a dip that is sometimes described as peri-centric. After the eruption of Krakatoa in 1883 a magnificent natural section of the great cone of Rakata, at the S. end of the island, was exposed—the northern half having been blown away—and it was then evident that this mountain was a solid cone, which was built up of a great succession of irregular beds of tuff and lava, braced together by intersecting dykes.

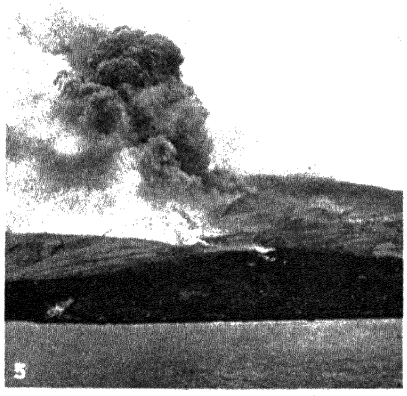
Parasitic Cones.—In the case of a lofty volcano the column of lava may not have sufficient ascensional force to reach the crater at the summit, or at any rate it finds easier means of egress at some weak spot, often along radial cracks, on the flanks of the mountain. Thus at Etna, which rises to a height of more than 10,800 ft., the eruptions usually proceed from lateral fissures, sometimes at least half-way down the mountain-side. When fragmental materials are ejected from a lateral vent a cinder-cone is formed, and by frequent repetition of such ejections the flanks of Etna have become dotted over with hundreds of scoria-cones much like the puys of Auvergne, the largest (Monte Minardo) rising to a height of as much as 750 ft. Hills of this character, seated on the parent mountain, are known as parasitic cones, minor cones, lateral cones, etc. Such subordinate cones often show a tendency to a linear arrangement, rising from vents or *bocche* along the floor of a line of fissure. Thus in 1892 a chain of five cones arose from a rift on the S. side of Etna, running in a N. and S. direction, and the hills became known as the Monti Silvestri, after Professor Orazio Silvestri of Catania. This rift, however, was but a continuation of a fissure from which there arose in 1886 the series of cones called the Monti Gemmellaro, while this in turn was a prolongation of a rent opened in 1883.

Fissure and Plateau Eruptions.—In certain parts of the world there are vast tracts of basaltic lava with little or no evidence of cones or of pyroclastic accompaniment. To explain their formation von Richthofen suggested that they represent great floods of lava which were poured forth not from ordinary volcanic craters with more or less explosive violence, but from great fissures in the earth's crust, whence they may have quietly welled forth and spread as a deluge over the surface of the country. The eruptions were effusive rather than explosive. At the present day true fissure eruptions seem to be of rather limited occurrence, but excellent examples are furnished by Iceland. Here there are vast fields of black basalt, formed of sheets of lava which have issued from long chasms, studded in most cases with rows of small cones, but these generally so insignificant that they make no scenic features and might be readily obliterated by denudation.



It is believed that fissure eruptions must have played a far more important part in the history of the earth than eruptions of the familiar cone-and-crater type, the latter representing indeed only a declining phase of vulcanism. Sir Archibald Geikie, who specially studied the subject of fissure eruptions, regarded the Tertiary basaltic plateaux of N.E. Ireland and the Inner Hebrides as outflows from fissures, which are represented by the gigantic system of dykes that form so marked a feature in the geological structure of the northern part of Britain and Ireland. These dykes extend over an area of something like 40,000 sq.m., while the outflows form an aggregate of about 3,000 ft. in thickness. In parts of Nevada, Idaho, Oregon and Washington, sheets of late Tertiary basalt from fissure eruptions occupy an area of about 200,000 sq.m., and constitute a pile at least 2,000 ft. thick. In India the "Deccan traps" represent enormous masses of volcanic matter, probably of like origin but of Cretaceous date, whilst South Africa furnishes other examples of similar outflows.

Professor J. W. Gregory recognized in the Kapte plains of East Africa evidence of a type of vulcanism, which he distinguished as that of "plateau eruptions"; according to him a number of vents opened at the points of intersection of lines of weakness in a high plateau, giving rise to many small cones, and the simultaneous flows of lava from these cones united to form a broad sheet.



Submarine Volcanoes.—Since much of the face of the earth is covered by the sea, it seems likely that volcanic eruptions must frequently occur on the ocean-floor. When, as occasionally though not often happens, the effects of a submarine eruption

ACTIVE AND INACTIVE VOLCANOES

1. Lava stream from erupting Mauna Loa approaching fishing village of Hoopulou, Hawaii. Later the village was destroyed despite prayers and offerings of sacrifices to Pele, goddess of fire
2. Mauna Loa lava flowing into the ocean at Hoopulou Landing. Clouds of steam rise high in the air
3. Stream of molten lava from Mauna Loa flowing down the mountainside in a path of cooled and hardened lava. Spectators were able to approach to the very edge of the molten stream
4. Great mass of corded lava in the crater of Kilauea volcano in Hawaii
5. "Phantom Ship," a small island in Crater Lake, Oregon, supposed to resemble a sailing vessel. Owing to atmospheric changes it frequently seems to disappear from view against the background of Dutton Cliff
6. Corded lava at Mt. Vesuvius following the eruption of 1898. Mt. Somma may be seen in the distance to the left

are observed during the disturbance, it is seen that the surface of the sea is violently agitated, with copious discharge of steam; the water passes into a state of ebullition, perhaps throwing up huge fountains; shoals of dead fishes, with volcanic cinders, bombs and fragments of pumice, float around the centre of eruption, and ultimately a little island may appear above sea-level. This new land is the peak of a volcanic cone which is based on the sea-floor, and if in deep water the submarine mountain must evidently be of great magnitude. Christmas Island in the Indian Ocean, described by Dr. C. W. Andrews, appears to be a volcanic mountain, with Tertiary limestones, standing in water more than 14,000 ft. deep. Many volcanic islands, such as those abundantly scattered over the Pacific, must have started as submarine volcanoes which reached the surface either by continued upward growth or by upheaval of the sea-bottom. Etna began its long geological history by submarine eruptions in a bay of the Mediterranean, and Vesuvius in like manner represents what was originally a volcano on the sea-floor.

One of the best examples of a submarine eruption resulting in the formation of a temporary island occurred in 1831 in the Mediterranean between Sicily and the coast of Africa, where the water was known to have previously had a depth of 100 fathoms. After the usual manifestations of volcanic activity an accumulation of black cinders and ashes formed an island which reached at one point a height of 200 ft., so that the pile of erupted matter had a thickness of about 800 feet. The new island, which was studied by Constant Prévost, became known in England as Graham's Island, in France as Ile Julie and in Italy by various names, among them Isola Ferdinandea. Being merely a loose pile of scoriae, it rapidly suffered erosion by the sea, and in about three months was reduced to a shoal called Graham's Reef. In the year 1891 a submarine eruption occurred in the neighbourhood of the isle of Pantellaria in the same waters, but it gave rise to no island. A well-known instance of a temporary volcanic island was furnished by Sabrina—an islet of cinders thrown up by submarine eruptions in 1811, off the coast of St. Michael's, one of the Azores. The island of Bogosloff, or Castle Island, in Bering Sea, about 40 m. W. of Unalaska Island, is a volcanic mass which was first observed in 1796 after an eruption. In 1883 another eruption in the neighbouring water threw up a new volcanic cone of black sand and ashes, known as New Bogosloff or Fire Island, situated about ½ m. N.W. of Old Bogosloff, with which it was connected by a low beach.

Mud Volcanoes.—Two distinct sets of phenomena are thus described. One type is due to the escape of gas from petroleum-bearing strata and has nothing to do with vulcanicity. Many of the most-quoted examples belong to this group, such as those of the Crimea, the Caspian and Burma. There are, however, true volcanic outbursts which yield mostly mud, that is, mixtures of water and fine volcanic material. They are closely related to geysers (*q.v.*), the chief difference being that the water is more or less muddy, instead of clear. In some cases the material emitted is quite pasty. True mud-volcanoes occur in Iceland, Sicily and in fact in many volcanic areas.

GEOGRAPHICAL DISTRIBUTION

It is a matter of frequent observation that volcanoes are most abundant in regions marked by great seismic activity. Although the volcano and the earthquake are not usually connected in the direct relation of cause and effect, yet in many cases they seem referable to a common origin. Both volcanic extrusion and crustal movement are means of relieving local strains in the earth's crust, and both are found to occur, as might reasonably be expected, in many parts of the earth where folding and fracture of the rocks have frequently happened and where mountain-making appears to be still in progress. Thus, volcanoes may often be traced along zones of crustal deformation, or folded mountain-chains, especially where they run along the oceanic basins.

The most conspicuous example of linear distribution is furnished by the great belt of volcanoes, which engirdles intermittently the huge basin of the Pacific; though here, as elsewhere in studying volcanic topography, regard must be paid to dormant and extinct centres as well as to those that are active at the present time. As volcanoes are in many cases ranged along what are commonly regarded as lines of fracture, it is not surprising that the centres of most intense vulcanicity are in many cases situated at the intersection of two or more fracture-lines. On the eastern side of the Pacific the great volcanic ring may be traced, though with many interruptions, from Cape Horn to Alaska. In South America the chain of the Andes between Corcovado in the south and Tolima in the north is studded at irregular intervals with volcanoes, some recent and many more extinct, including the loftiest volcanic mountains in the world. The grandest group of South American volcanoes, though mostly quiescent, is in Ecuador. Cotopaxi, seen in activity by E. Whymper in 1880, has, according to him, a height of 19,613 ft., whilst Sangay is said to be one of the most active volcanoes in the world. The volcanic rock called andesite was so named by L. von Buch from its characteristic occurrence in the Andes. It is notable that the volcanic rocks throughout the great Pacific belt present much similarity in composition. The volcanoes of Ecuador have been described in detail by A. Stübel and others (*see* ANDES). Central America contains a large number of active volcanoes and solfataras, many of which are located in the mountains parallel to the western coast; Guatemala is peculiarly rich in volcanoes, as described by Dr. Tempest Anderson, who visited the country in 1907; and the plateau of Mexico is the seat of several active volcanoes which occur in a band stretching across the country from Colima in the west to Tuxtla near Vera Cruz. The highest of these is Orizaba (18,200 ft.), which is known to have been active in the 16th century. Popocatepetl ("the smoking mountain") reaches a height of about 17,880 ft., and from its crater sulphur was at one time systematically collected. The famous volcano of Jorullo, near Toluca and about 120 m. from the sea, has been the centre of much scientific discussion since it was regarded by Humboldt, who visited it in 1803, as a striking proof of the elevation theory; it came into existence rapidly during an eruption which began in Sept. 1759, when it was said by unscientific observers that the ground became inflated from below.

In the United States very few volcanoes are active at the present day, though many have become extinct only in times that are geologically recent. An eruption occurred in 1857 at Tres Virgines, in the south of California, and Lassen's Peak (California) renewed its activity in a mild way a few years ago. The Mono Valley craters and Mount Shasta, in California, are extinct. The Cascade range contains numerous volcanic peaks, but only few show signs of activity. Mount Hood, in Oregon, exhales vapour, as also does Mount Rainier in Washington. Mount St. Helens (Washington) was in eruption in 1841 and 1842; and Mount Baker (Washington), the most northern of the volcanoes connected with the Cascade range, was reported active in 1843.

Volcanic activity is prominent in Alaska, along the Coast range and in the neighbouring islands. Mount Fairweather has probably been in recent activity, and the lofty cone of Mount Wrangell, on Copper river, is reported to have been in eruption in 1819. In the neighbourhood of Cook's Inlet there are several volcanoes, including the island of St. Augustine. Unimak Island has two volcanoes, which have supplied the natives with sulphur and obsidian. The Aleutian volcanic belt is a narrow, curved chain of islands, extending from Cook's Inlet westward for nearly 1,600 miles. It is notable that the convexity of the curve faces the ocean.

From the Aleutians the volcanic band of the Pacific changes its direction, and, passing to the peninsula of Kamtchatka, where 14 volcanoes are said to be active, turns southward and forms the festoon of the Kurile Islands. Here again the convexity of the insular arc is directed towards the ocean. This volcanic archipelago leads on to the great islands of Japan. Of the 54 volcanoes recognized as now active or only recently extinct in Japan, the best known is the graceful cone of the sacred mountain Fuji-san, but others less pretentious are far more dangerous. The great eruption of Bandai-san, about 120 m. N. of Tokio, which occurred in 1888, blew off one side of the peak called Kobandai, removing, according to Prof. Sekiya's estimate, about 2,982 million tons of material.

South of the Japanese archipelago the train of volcanoes passes through some small islands in or near the Liu Kiu group and thence onward by Formosa to the Philippines, where subterranean activity finds abundant expression in earthquakes and volcanoes. After leaving this region the linear arrangement of the eruptive centres becomes less distinctly marked, for almost every island in the Moluccas and the Sunda archipelago teems with volcanoes, solfataras and hot springs. Possibly, however, a broken zone may be traced from the Moluccas through New Guinea and thence to New Zealand, perhaps through eastern Australia.

The great volcanic district in New Zealand is situated in the northern part of North Island, memorable for the eruption of Tarawera in 1886. This three-peaked mountain on the south side of Lake Tarawera, not previously known to have been active, suddenly burst into action; a huge rift opened, and Lake Rotomahana subsided, with destruction of the famous sinter terraces.

Far to the south, on Ross Island, off South Victoria Land, in Antarctica, are the volcanoes Erebus and Terror, the former of which is active. These are often regarded as remotely related to the Pacific zone, but Dr. G. T. Prior has shown that the Antarctic volcanic rocks which he examined belonged to the Atlantic and not the Pacific type.

Within the great basin of the Pacific, imperfectly surrounded by its broken girdle of volcanoes, there is a vast number of scattered islands and groups of islands of volcanic origin, rising from deep water, and having in many cases active craters. The most important group is the Hawaiian archipelago, where there is a chain of at least 15 large volcanic mountains—all extinct, however, with the exception of three in Hawaii, namely Mauna Loa, Kilauea and Hualalai; and of these Hualalai has been dormant since 1811. It is noteworthy that the two present gigantic centres of activity, though within 20 m. of each other, appear to be independent in their eruptivity. The volcanic regions of the Pacific are connected with those of the Indian Ocean by a grand train of islands rich in volcanoes, stretching from the west of New Guinea through the Moluccas and the Sunda Islands, where they form a band extending axially through Java and Sumatra. Here is situated the principal theatre of terrestrial vulcanicity, apparently representing an enormous fissure, or system of fissures, in the earth's crust, sweeping in a bold curve, with its convexity towards the Indian Ocean. Numerous volcanic peaks occur in the string of small islands to the east of Java—notably in Flores, Sumbawa, Lombok and Bali; and one of the most terrific eruptions on record in any part of the world occurred in the province of Tomboro, in the island of Sumbawa, in 1815. Java contains within its small area as many as 49 great volcanic mountains—active, dormant and extinct. The most famous is Papandayang, which erupted with great suddenness and violence in 1772.

The little uninhabited island of Krakatoa in the Strait of Sunda appears to be situated at the intersection of two curved fissures, and the island itself represents part of the basal wreck of what was once a volcano of gigantic size. After two centuries of repose, a violent catastrophe occurred in 1883, whereby part of the island was blown away. This eruption and its effects were made the subject of careful study by Verbeek, Bréon and Judd.

Through the great island of Sumatra, a chain of volcanoes runs longitudinally, and may possibly be continued northwards in the Bay of Bengal by Barren Island and Narcondam—the former an active and the latter an extinct volcano. On the western side of the Indian Ocean a small volcanic band may be traced in the islands of the Mascarene group, several craters in Réunion (Bourbon) being still active. Far south in the Indian Ocean are the volcanic islands of New Amsterdam and St. Paul. The Comoro Islands in the channel of Mozambique exhibit volcanic activity, whilst in East and Central Africa there are several centres, mostly extinct but some partially active, associated with the Rift Valleys. The enormous cones of Kenya and Kilimanjaro are extinct, but on one of the summits of the latter, a crater is still preserved. The Mfumbiro volcanoes, S. of Lake Edward, rise to a height of more than 14,700 feet. Kirunga, N. of Lake Kivu, is still partially active. Elgon is an old volcanic peak, but Ruwenzori is not of volcanic origin. On the west side of Africa, the Cameroon Peak is a volcano which was active in 1909, and the island of Fernando Po is also volcanic. Along the Red Sea there are not wanting several examples of volcanoes, such as Jebel Teir, the Twelve Apostles islands, and Aden, which is situated on the wreck of an old volcano.

Passing to the Atlantic, a broken band of volcanoes, recent and extinct, may be traced longitudinally through certain islands, some of which rise from the great submarine ridge that divides the ocean, in part of its length, into an eastern and a western trough. The northern extremity of the series is found in Jan Mayen, an island in the Arctic, where an eruption occurred in 1818. Iceland, however, with its wealth of volcanoes and geysers, is the most important of all the Atlantic centres: according to Dr. T. Thoroddsen there are in Iceland about 130 post-glacial volcanoes, and it is known that from 25 to 30 have been in eruption during the historic period. Many of the Icelandic lava-flows, such as the immense flood from Laki in 1783, are referable to fissure eruptions, which are the characteristic though not the exclusive form of activity in this island. This type was also responsible for the sheets of old lava in the terraced hills of the Faroe Islands, and the Tertiary eruptions of the west of Scotland and the north of Ireland.

An immense gap separates the old volcanic area of Britain from the volcanic archipelagos of the Azores, the Canaries and the Cape Verde Islands. The remaining volcanic islands of the Atlantic chain, all now cold and silent, include Ascension, St. Helena and Tristan da Cunha.

An interesting volcanic region is found in the West Indies, where the Lesser Antilles—the scene of the great catastrophes of 1902—form a string of islands, stretching in a regular arc that sweeps in a N. and S. direction across the E. end of the Caribbean. Subject to frequent seismic disturbance, and rich in volcanoes, solfataras and hot springs, these islands seem to form the summit of a great earth-fold which, rising as a curved ridge from deep water, separates the Caribbean from the Atlantic. The volcanoes are situated on the inner border of the curve.

Vesuvius is the only active volcano on the mainland of Europe but in the Mediterranean there are Etna on the coast of Sicily; the Lipari Islands, with Stromboli and Vulcano in chronic activity; and farther to the east the archipelago of Santorin, which has erupted recently. Submarine eruptions have occurred also between Sicily and the coast of Africa; one in 1831 having—as we have seen above—given rise temporarily to Graham's Island, and another in 1891 appearing near Pantellaria, itself a volcanic isle. Of the extinct European volcanoes, some of the best known are in Auvergne, the Eifel, Bohemia and Catalonia, whilst the volcanic land of Italy includes the Euganean hills, the Alban hills, the Phlegraean Fields, etc.

The number of volcanoes known to be actually active on the earth is generally estimated at between 300 and 400, but there is reason to believe that this estimate is far too low. If account be taken of those volcanic cones which have not been active in historic time, the total will probably rise to several thousands.

THE CAUSES OF VULCANICITY

There is no doubt that the ultimate cause of vulcanicity is the internal heat of the earth; perhaps it would be more correct to say that vulcanicity is merely one of the expressions of the familiar fact that the interior of the earth is hotter than the exterior. The source of this heat is strictly not a geological question, and is fully discussed in the article EARTH, while many of its implications are dealt with under PETROLOGY.

It is self-evident that at great depths the pressure due to the weight of overlying rock must be enormous, and since it is known that magmas are rich in substances that may exist as gases at low pressures, the vapour-tension in depth must also be enormous, quite sufficient to drive material to the surface with explosive violence if a passage is opened for it. In some cases the eruption may actually be brought about by gas-pressure alone, which opens its own passage, and this is doubtless the usual procedure in later eruptions from a vent once established. But in the initiation of a new centre there is probably, as a rule, some other contributing

cause, which, so to speak, pulls the trigger and starts the explosion.

It is now generally held that such a cause is to be looked for in movements and fractures of the outer crust of the earth, however these may be brought about, a matter as yet by no means settled. The common coincidence of mountain-folding and vulcanicity, both in time and place, is highly significant. Folding produces lines of weakness and even actual fracture, and points of special weakness, such as the crossing of two fractures, become the seats of volcanoes, as has been set forth above.

It has long been noted that the majority of volcanoes are more or less near the sea, though in many cases the distances are actually considerable when measured in miles. This association, taken together with the emission of large quantities of steam during eruptions, naturally led to the theory that vulcanicity was due to the access of sea-water to the heated interior of the earth. There can be little doubt that the great explosion at Krakatoa in 1883 was actually due to this cause, but the eruption had begun before the water got in, the explosion being in reality a secondary effect. Access of water through fractures cannot be accepted as a general cause, and most volcanic water is probably of magmatic origin. We can only say that vulcanicity is due to the escape under pressure of heated material through channels of weakness in the earth's crust, and that these channels may be formed in several different ways: by folding and fracture, by compression or by tension; the character and products of the eruptions also varying somewhat in accordance with the different types of crust-movement concerned, as explained earlier in this article.

VOLCANO ISLANDS, three small islands in the western Pacific Ocean, south of the Bonin Islands, forming part of the Japanese empire (annexed in 1891). They are also known as the Magellan Archipelago, and in Japan as Kwazan-retto (series of volcanic islands). They are situated between 24° and 26° N. and 141° and 142° E. Their names are Kita-iwo-jima (Santo Alessandro), Iwo-jima (Sulphur) and Minami-iwo-jima (Santo Agostino). Kita-iwo-jima—which, as its name (*kita*) implies, is the most northerly of the three—rises 2,520 ft. above the water, and Minami-iwo-jima, the most southerly, to 3,021 ft.

VOLCI: *see* VULCI.

VOLE, a name employed for several genera of rodents allied to the rats and mice and included in the family *Muridae.* The two common English forms are better known as the water-rat and the short-tailed field-mouse. Voles may be distinguished from rats and mice by their small eyes, blunt snouts, stouter build, inconspicuous ears, short limbs and tail and less brisk movements. They also differ in the structure of the cheek-teeth. The European field-vole (*Microtus agreatis*) is about the size of a mouse and does considerable damage to crops and garden-produce. The water-vole (*M. amphibius*) is larger, diurnal and aquatic. Largely vegetarian, it will also eat insects, mice and young birds. It is absent from Ireland, but extends from England to China. Numerous other species occur in Europe, north Asia and North America, while fossil voles occur in the European Pliocene. (*See* RODENTIA.)

VOLENDAM, a small fishing village of Holland in the province of North Holland, adjoining Edam on the shores of the Zuider Zee. It is remarkable for its quaint buildings and the picturesque costume of the villagers, who are of a singularly dark and robust type. Many artists have been attracted to settle here. Volendam has its origin in the building of the great sea-dam for the new waterway to Edam in the middle of the 14th century. On the seaward side of the dike are some houses built on piles in the style of lake dwellings. The draining of a large part of the Zuider Zee, in progress in 1929, will change the position and relations of Volendam very greatly.

VOLGA (Tatar: Etil, Itil or Atel; Finnish: Rau; in ancient times Rha and Oarus), the longest and most important river of European Russia, and the longest river of Europe. Its length is 2,325 m.; its drainage area covers 563,300 sq.m. and includes middle and eastern Russia, as well as part of south-eastern Russia. The Volga rises on the Valdai plateau at a height of 665 ft., in a small spring in 57° 15′ N., 32° 30′ E., west of Lake Seliger, flows through several small lakes, and after its confluence with the Runa, enters Lake Volga. Below that lake is a dam storing 10,000 million cu.ft. of water, so as to make possible the deepening of the channel as far as the Sheksna, during dry periods. After receiving the Sheksna the Volga flows south-east along a broad valley, consisting of a string of former wide lake beds, with a depth of 150–200 ft., in Permian and Jurassic deposits. It receives numerous tributaries from the north including the Unzha (365 miles). The Oka from the south-west (950 m.) rises in Orel, near the sources of tributaries of the Don and Dnieper, and receives the Upa, Zhizdra, Ugra, Moskva and Klyazma (left), and the Tsna with the Moksha (right).

The Oka and Volga unite at Nizhniy-Novgorod, and the Volga then enters a broad lacustrine depression which must have communicated with the Caspian in post-pliocene times. Its low-water level in this section is only 190 ft. above sea-level, and its width ranges from 350 to 1,750 yards. Islands appear and disappear each year after the spring floods. The Sura, bringing a volume of 2,700 to 22,000 cu.ft. per second enters on the right, as do the Svyaga and many smaller tributaries. The Volga then turns south-eastward and descends into another lacustrine depression, receiving the Kama, volume 52,500 to 144,400 cu.ft. per second, below Kazan, along which come the products of the Ural mining region; remains of molluscs still extant in the Caspian occur in this depression and in the lower Kama. The Volga then flows south-south-west, making a great bend at Samara to avoid the Zheguli extension of the Russian plateau. The Volga at Samara is only 54 ft. above sea-level. Along the whole of the bend, cliffs fringe the right bank, which the river is constantly undercutting, while from the left bank extends a great plain intersected by former channels of the river. At Stalingrad (Tsaritsyn) the river reaches its extreme south-western limit and is only 45 m. from the Don. In 1928 the Soviet government accepted estimates for the construction of a canal with sluices on the Don, to link these two rivers; it is hoped that the canal will be opened in 1935. The river then turns sharply to the south-east, flowing through the low Caspian steppes. A few miles above Stalingrad it sends off a branch, the Akhtuba, which accompanies it to the sea for 330 m. Low hills skirt the right bank, but on the left it anastomoses freely with the Akhtuba and often floods the country for 15 to 35 miles.

Efforts are being made to control the Volga here so as to lessen the annual washing away of fertile alluvial gardens. The delta begins 40 m. above Astrakhan and contains as many as 200 mouths. The Volga is constantly eroding its banks, especially during the spring floods, and towns and loading ports have constantly to be moved back, consequently the volume of suspended matter deposited on the Caspian shores is great; the level of that sea rises during the Volga floods.

Navigation.—There are six sections of the river for navigation. (1) From the Upper Volga Dam, 75 m. from the source, to Tver. Here rapids and shallows are numerous, and this part

is exclusively used for floating rafts. (2) From Tver to Rybinsk, which is the real head of Volga navigation. In this section the main traffic consists of barges for local trade; up to June 20, vessels drawing 2 ft. may use the river, but after that date 1 ft. 9 in. is the maximum possible draft, and the river becomes increasingly shallow, so that navigation may cease altogether. The influence of the Upper Volga Dam may give an extra 9 in. of depth. Above Rybinsk the Volga is joined by the Mologa, and at Rybinsk by the Sheksna, which is navigable and which is linked by the Marii and Württemberg canals with the basins of the Neva and Northern Dwina respectively. Fifteen thousand vessels enter the port per annum. (3) From Rybinsk to Nizhniy-Novgorod, 349 m., the normal draught of vessels is 3 ft. 6 in., but in years of low water, navigation may be completely suspended in July and August. In this section are 30 commercial landing stages and 20 harbours suitable for wintering vessels. (4) From Nizhniy-Novgorod to Kazan, 299 m., the normal draught is 5 feet. There are 40 commercial landing stages and 40 harbours, only ten of the latter being really ice-proof. (5) Kazan to Stalingrad, 938 m., normal draught 7 feet. There are 37 commercial landing stages and 28 harbours, six of which are really safe and ice-proof. (6) Stalingrad to the Caspian is divided into two parts (i.) Stalingrad to Astrakhan, 343 m. where the navigation is still of the river type and (ii.) Astrakhan to the Caspian, 71 m. a stretch of non-tidal estuary, very difficult for navigation, where continuous dredging is necessary to ensure even 8 ft. depth.

The great drawbacks to navigation are (1) the long winter frost, during which the river and its tributaries become sledge routes, the ice lasting from 90 to 160 days; the average date of break-up of ice is April 11 at Tver, the 25th at Kostroma, the 16th at Kazan, the 7th at Stalingrad and March 17 at Astrakhan (2) the shallowness of the river during late summer and the frequent formation of islands and their dissolution during flood time.

Fisheries.—The network of shallow and still *limans* or "cut-offs" in the delta of the Volga and the shallow waters of the northern Caspian, freshened as these are by the water of the Volga, the Ural, the Kura and the Terek, is exceedingly favourable to the breeding of fish, and as a whole constitutes one of the most productive fishing grounds in the world. As soon as the ice breaks up in the delta innumerable shoals of roach (*Leuciscus rutilus*) and trout (*Luciotrutta leucichthys*) rush up the river. They are followed by the great sturgeon (*Acipenser huso*), the pike, the bream and the pike perch (*Leucioperca sandra*). Later on appears the Caspian herring (*Clupea caspia*), which formerly was neglected, but has now become more important than sturgeon; the sturgeon *A. stellatus* and "wels" (*Silurus glanis*) follow, and finally the sturgeon *Acipenser güldenstadtii*, so much valued for its caviare. In search of a gravelly spawning-ground the sturgeon go up the river as far as Sarepta (250 m.). The lamprey, now extensively pickled, the sterlet (*A. ruthenus*), the tench, the gudgeon and other fluvial species also appear in immense numbers. Destructive exploitation at spawning time has much diminished the yield of the Volga fisheries, and the discharge of oil from steamers has also had an adverse effect.

History.—The Volga was probably known to the early Greeks, though it is not mentioned previous to Ptolemy. According to him, the Rha is a tributary of an interior sea, formed from the confluence of two great rivers, the sources of which are separated by 20 degrees of longitude. The Arab geographers throw little light on the condition of the Volga during the great migrations of the 3rd century, or subsequently under the invasion of the Huns, the growth of the Khazar empire in the southern steppes and of that of Bulgaria on the middle Volga. In the 9th century the Volga basin was occupied by Finnish tribes in the north and by Khazars and various Turkish races in the south. The Slavs, driven perhaps to the west, had only the Volkhov and the Dnieper, while the (Mohammedan) Bulgarian empire, at the confluence of the Volga with the Kama, was so powerful that for some time it was an open question whether Islam or Christianity would gain the upper hand, and Islam is strong in Kazan to-day. But, while the Russians were driven from the Black Sea by the Khazars, and later on by a tide of Ugrian migration from the north-east, a stream of Slavs moved slowly towards the north-east, down the upper Oka, into the borderland between the Finnish and Turkish regions. After two centuries of struggle the Russians succeeded in colonizing the fertile valleys of the Oka basin; in the 12th century they built a series of fortified towns on the Oka and Klyazma; and finally they reached the mouth of the Oka, there founding (in 1222) a new Novgorod—the Novgorod of the Lowlands, now Nizhniy-Novgorod. The great lacustrine depression of the middle Volga was thus reached; and when the Mongol invasion of 1239–42 came, it encountered in the Oka basin a dense agricultural population with many fortified and wealthy towns—a population which the Mongols found they could conquer, but were unable to drive before them as they had done so many of the Turkish tribes. This invasion checked, but did not stop, the advance of the Russians down the Volga. Two centuries elapsed before the Russians covered the 300 m. which separate the mouths of the Oka and the Kama and took possession of Kazan.

With the capture of Kazan (1552) the Russians found the lower Volga open to their boats, and eight years afterwards they were masters of the mouth of the river at Astrakhan. Two centuries more elapsed before the Russians secured a free passage to the Black Sea and became masters of the Sea of Azov and the Crimea; the Volga, however, was their route.

BIBLIOGRAPHY.—P. P. Semenov's *Geographical and Statistical Dictionary* (5 vols., St. Petersburg, 1863–85) contains a full bibliography of the Volga and tributaries. *See* also V. Ragozin's *Volga* (3 vols., St. Petersburg, 1880–81, with atlas; in Russian); N. Bogolyubov, *The Volga from Tver to Astrakhan* (Russian, 1876); H. Roskoschny, *Die Wolga und ihre Zuflüsse* (Leipzig, 1887, vol. i.), history, ethnography, hydrography and biography, with rich bibliographical information; N. Boguslavskiy, *The Volga as a Means of Communication* (Russian, 1887), with detailed profile and maps; Peretyatkovich, *Volga region in the 15th and 16th Centuries* (1877); and Lender, *Die Wolga* (1889). *The Don and Volga Basins* (1920). *Foreign Office Historical Handbook No. 53* (English).

VOLHYNIA, a province of Poland, having on the north the province of Polesie, on the west Lublin, on the south Tarnopol provinces, and on the east Russia. It is only half the old region of Volhynia, which, after belonging in turn to Russia, Poland and Russia again, has now been divided between the two. Area, 11,693 sq. miles. Pop. (1921) 1,438,000, of whom 68·4% are Ruthenians or Ukrainians, 16·8% Poles, 10·6% Jews and 4·2% other nationalities, so that Polish Volhynia, like Russian Volhynia, is almost entirely an Ukrainian country. It is thickly populated in most parts and has always been covered with large estates owned by Polish landowners, many of whom were descended from Russian and Lithuanian princes. It is a plain, washed by the Bug and the tributaries of the Prypet, viz., the Turija, Stochod, Styr, Goryn and Slucz, flowing north from the southern uplands. The north is part of the Polesian forest area, the rest is fertile soil. The chief towns are Luck, Ostróg, Rowno, Dubno, Kowel and Krzemieniec.

VOLHYNIA, a former Government of Russia, now in the Ukrainian S.S.R. (*q.v.*).

VOLITION, in psychology. *See* CONATION and PSYCHOLOGY.

VOLK, LEONARD WELLS (1828–1895), American sculptor, was born at Wellstown (now Wells), Hamilton county, New York, on Nov. 7, 1828. He first followed the trade of a marble cutter with his father at Pittsfield, Mass. In 1848 he opened a studio at St. Louis, Mo., and in 1855 was sent by his wife's cousin, Stephen A. Douglas, to Rome to study. Returning to America in 1857, he settled in Chicago, where he helped to establish an academy of design and was for eight years its head. Among his principal works are the Douglas monument at Chicago and the Soldiers' and Sailors' monument at Rochester, N.Y.; and statues of President Lincoln and Stephen A. Douglas in the Illinois State capitol at Springfield, Ill. In 1860 he made a life-mask (now in the National Museum, Washington) of Lincoln, of whom only one other, by Clark Mills in 1865, was ever made.

VOLKSRUST, a town of the Transvaal, near the Natal border, situated 5,429 ft. above sea-level, and 320 m. N.N.W. of Durban by rail. It was founded by the Boer Government in 1888 and was of some importance as a customs port of entry. It lost this function at the Union in 1910. It is now a market

centre for a pastoral district. Pop. (1921) 3,317 (2,218 whites).

VOLLENHOVEN, CORNELIS VAN (1874–), Dutch jurist, was in 1901 appointed professor of colonial law in the University of Leyden. He had a wide reputation as an authority on the common law of the Dutch East Indies and on international law. His chief work is *Hetadatrecht van Nederlandsch-Indië* (The Common Law of the Dutch East Indies, 1906–18).

VOLNEY, CONSTANTIN FRANÇOIS CHASSEBOEUF, COMTE DE (1757–1820), French *savant,* was born at Craon (Maine-et-Loire) on Feb. 3, 1757, of good family; he was at first surnamed Boisgirais from his father's estate, but afterwards assumed the name of Volney. He spent some four years in Egypt and Syria, and published his *Voyage en Egypte et en Syrie* in 1787, and *Considérations sur la guerre des Turcs et de la Russie* in 1788. He was a member both of the States-General and of the Constituent Assembly. In 1791 appeared *Les Ruines, ou méditations sur les révolutions des empires,* an essay on the philosophy of history. Volney tried to put his politico-economic theories into practice in Corsica, where in 1792 he bought an estate and made an attempt to cultivate colonial produce. He was thrown into prison during the Jacobin triumph, but escaped the guillotine. He was some time professor of history at the newly founded École Normale. In 1795 he undertook a journey to the United States, where he was accused in 1797 of being a French spy sent to prepare for the reoccupation of Louisiana by France. He was obliged to return to France in 1798. The results of his travels took form in his *Tableau du climat et du sol des États-Unis* (1803). He was not a partisan of Napoleon, but, being a moderate man, a *savant* and a Liberal, was impressed into service by the emperor, who made him a count and put him into the senate. At the restoration he was made a peer of France. He became a member of the Institute in 1795. He died in Paris on April 25, 1820.

See G. Chinard, *Volney et l'Amérique* (1923).

VOLO, a seaport of Greece, on the E. coast of Thessaly, at the head of the gulf to which it gives its name. Pop. (1924) 41,275. It is connected by rail with the main Athens-Salonika railway at Larissa. The anchorage is safe, vessels loading and discharging by means of lighters. The port has a depth of 23 to 25 ft.

The *Kastro* (citadel) marks the site of Pagasae, whence the gulf took the name of Sinus Pagasaeus or Pagasicus. Hence the Argonautic expedition was said to have sailed. In the fourth century it flourished under the tyrant Jason of Pherae. Two miles farther S. stand the ruins of Demetrias, one of the "Fetters of Greece," founded 290 B.C. by Demetrius Poliorcetes, and a favourite residence of Macedonian kings.

VOLOGAESES, the name of five Parthian kings.

(1) VOLOGAESES I., son of Vonones II. by a Greek concubine (Tac. *Ann.* xii. 44), succeeded his father in A.D. 50 (Tac. *Ann.* xii. 14; *cf.* Joseph. *Ant.* xx. 3, 4). He gave the kingdom of Media Atropatene to his brother Pacorus, and occupied Armenia for another brother, Tiridates (Tac. *Ann.* xii. 50, xv. 2; Joseph, *Ant.* xx. 3, 4). This led to a long war with Rome (54–63), which was ably conducted by the Roman general Corbulo. The power of Vologaeses was weakened by an attack of the Dahan and Sacan nomads, a rebellion of the Hyrcanians, and the usurpation of Vardanes II. (Tac. *Ann.* xiii. 7, 37; xiv. 25; xv. 1; *cf.* Joseph. *Ant.* xx. 4, 2, where he is prevented from attacking the vassal king of Adiabene by an invasion of the eastern nomads). At last a peace was concluded, by which Tiridates was acknowledged as king of Armenia, but had to become a vassal of the Romans; he went to Rome, where Nero gave him back the diadem (Tac. *Ann.* xv. 1 ff.; Dio Cass. lxii. 19 ff., lxiii. 1 ff.); from that time an Arsacid dynasty ruled in Armenia under Roman supremacy. Vologaeses was satisfied with this result, and honoured the memory of Nero (Suet. *Nero,* 57), though he stood in good relations with Vespasian also, to whom he offered an army of 40,000 archers in the war against Vitellius (Tac. *Hist.* iv. 51; Suet. *Vespas.* 6; *cf.* Joseph. *Ant.* vii. 5, 2, 7, 3; Dio Cass. lxvi. 11). Soon afterwards the Alani, a great nomadic tribe beyond the Caucasus, invaded Media and Armenia (Joseph. *Bell.* vii. 7, 4); Vologaeses applied in vain for help to Vespasian (Dio Cass. lxvi. 11; Suet. *Domitian,* 2). It appears that the Persian losses in the east also could not be repaired; Hyrcania remained an independent kingdom (Joseph. *Bell.* vii. 7, 4; Aurel. Vict. *Epit.* 15, 4). Vologaeses I. died about A.D. 77. His reign is marked by a decided reaction against Hellenism; he built Vologesocerta (Balashkert) in the neighbourhood of Ctesiphon with the intention of drawing to this new town the inhabitants of the Greek city Seleucia (Plin. vi. 122).

(2) VOLOGAESES II., probably the son of Vologaeses I., appears on coins, which bear his proper name, in 77–79, and again 121–47. During this time the Parthian kingdom was torn by civil wars between different pretenders, which reached their height during the war of Trajan, 114–17. Besides Vologaeses II. we find on coins and in the authors Pacorus (78–*c.* 105), Artabanus III. (80–81), Osroes (106–29), Mithradates V. (*c.* 129–47) and some others; thus the Parthian empire seems during this whole time to have been divided into two or three different kingdoms.

(3) VOLOGAESES III., 147–91. Under him, the unity of the empire was restored. But he was attacked by the Romans under Marcus Aurelius and Verus (162–65). In this war Seleucia was destroyed and the palace of Ctesiphon burnt down by Avidius Cassius (164); the Romans even advanced into Media. In the peace, western Mesopotamia was ceded to the Romans (Dio Cass. lxxi. 1 ff., Capitolin. *Marc. Aur.* 8 f.; Verus 8, etc.). Vologaeses III. is probably the king Volgash of the Parsee tradition, preserved in the *Dinkart,* who gathered the writings of Zoroaster.

(4) VOLOGAESES IV., 191–209. He was attacked by Septimius Severus in 195, who advanced into Mesopotamia, occupied Nisibis and plundered Ctesiphon (199), but attempted in vain to conquer the Arabic fortress Atra; in 202 peace was restored.

(5) VOLOGAESES V., 209–*c.* 222, son of Vologaeses IV. Soon after his accession his brother Artabanus IV., the last Arsacid king, rebelled against him, and became master of the greater part of the empire (Dio Cass. lxxvii. 12). But Vologaeses V. maintained himself in a part of Babylonia; his dated coins reach down to A.D. 222. (ED. M.)

VOLOGDA, a province of the Russian S.F.S.R., very much smaller than the pre-1917 province of that name. Area 110,365 sq.km. Pop. (1926) 1,052,645. The provinces of North Dwina, Kostroma, Yaroslavl and Cherepovetz fringe it, as does the Leningrad Area and the Karelian A.S.S.R.

Much of it was under ice during the glacial epoch, and it is a region of boulder clay, marsh, lakes and numerous streams. The largest lakes are Kubensk and Lacha, and the rivers include the Sukhona, flowing north-west from Lake Kubensk, and the upper course of the Onega and of the Vaga, both flowing northward, the former into the Arctic Ocean and the latter joining the northern Dwina. Nearly half of the province is covered with coniferous forest, densest in the north, and there are vast marshes. The south has been largely cleared of forest and in spite of the poor soil and difficult climatic conditions, crops are raised. The climate is continental and the winter long. Average January temperature at Vologda 10·7° F, July 63·5° F. The climate is variable from year to year, and early autumn frost or unduly prolonged spring frost may ruin the crops. The rainfall is mainly in July and August and the dry spring and rainy summer are unfavourable to grain crops; it varies from 300 to 500 mm. per annum.

The chief crops are winter rye (37·9%) and oats (38·4%). Barley, flax, potatoes, summer wheat, grasses, peas and hemp are also grown in small quantities. The poor soil and need for careful manuring and preparation mean that 50 working days must go for soil preparation as against 15 days in the Kuban—Black Sea district. Cultivation provides 30% of the income of the province, and stock-raising and its dependent industries, 40%. Dairy cattle, of the Kholmogory breed in the north and the Yaroslavl breed in the south, are raised and dairying has developed rapidly since the railway provided an outlet for butter. There are about 400 dairy artels which co-operate for the purchase of separators and butter coolers and for sales, and refrigerators, new factories and small electric stations are under construction. Horses, sheep and pigs are also raised, the latter are increasing in dependence on the dairy industry. Poultry keeping is slowly developing. The timber industry is not well developed, owing

to lack of capital, though there is some saw-milling. It diminished markedly in the disturbed conditions of the civil war following 1917, and in 1920 was only 4% of the pre-war product. It is slowly recovering. In dependence on it there are paper manufactures and two cellulose and wood pulp factories.

The railway from Moscow to Archangel goes northwards through Vologda and in 1916 the single track was made double, thus much increasing its usefulness, and there are railway links from the town of Vologda to Leningrad and to the Vyatka-Perm railway. The Sukhona is a navigable water-way linking with the northern Dwina, and there is a canal linking Lake Kubensk with the Sheksna, a tributary of the Volga. Except for Vologda (*see* below) no town reaches a population of 6,000. The population is mainly Russian.

Vologda, the chief town of the above province, situated on the Vologda river above its confluence with the navigable Sukhona river, in 59° 14′ N., 39° 43′ E. Pop. (1926) 56,816. The town is a railway junction, and has railway and steamer repair yards, and manufactures agricultural implements, leather and beer. Pottery, glass and cement factories are under construction (1928), and there is a municipal electricity and water supply. It has grown rapidly as the railway developed, and has numerous trading enterprises, collecting local products for export to Archangel, Leningrad and Moscow.

Its trade is very ancient; it was founded as a colony of Novgorod in 1147, when the fur trade was at its height. The Tatars, in alliance with the Prince of Tver, plundered it in 1273, but it soon recovered. Moscow and Novgorod disputed possession of it until 1447, when it was definitely annexed to the former. The opening of Archangel as a port in 1553 made it the chief depôt for goods for the north. It was devastated by the Poles in 1613 and by plague in 1648. With the foundation in 1703 of St. Petersburg (Leningrad) trade went *via* the Baltic, and Vologda declined, but developed again after the building of the railway to Archangel.

VOLPI, COUNT GIUSEPPE (1877–), Italian statesman, was born at Venice on Nov. 19, 1877. In his youth he travelled extensively in the Balkans and the East, taking special note of local economic problems. In 1912 he was employed in the preliminary negotiations for the Peace of Lausanne, which assured for Italy the possession of the Dodekanese, and was one of the Italian delegates at Ouchy. In 1913 he was vice-president of the Balkan financial conferences. Volpi was a great figure in Italian industry and finance; he originated the proposal for the development of the port of Venice, and executed the hydroelectric scheme in the Veneto, and in part of Emilia and Venezia Giulia.

During the World War, Volpi, who was a keen interventionist, served on the Monfalcone front. In 1919 he was a member of the Supreme Economic Council in Paris, in 1921 governor of Tripolitana, where he remained until 1925. He carried out a successful campaign in 1922–23, and then established peace and carried out a bold programme of economic reconstruction. For his services he was created Count Volpi of Misurata. Volpi was chairman of the *Associazione fra la Società Italiana per Azione*, and was the trusted representative of Italian commerce and industry. These considerations and his success in Tripoli led Mussolini to appoint him minister of finance in July 1925, when the dissatisfaction with Stefani's finance administration was acute. Volpi concluded the arrangements for the settlement of the Italian debt to America (Nov. 12, 1925), and to Great Britain (Jan. 27, 1926).

VOLSCI, ancient Italian people who were prominent in the history of the first century of the Roman Republic. They then inhabited the partly hilly, partly marshy district of the S. of Latium, bounded by the Aurunci and Samnites on the S., the Hernici on the E., and stretching roughly from Norba and Cora in the N. to Antium in the S. They were among the most dangerous enemies of Rome, and frequently allied with the Aequi (q.v.). From the little town of Velitrae (Velletri) in the Volscian territory, the birthplace of Augustus, comes a very interesting though brief inscription dating probably from early in the 3rd century B.C. It is cut upon a small bronze plate (now in the Naples Museum), which must have once been fixed to some votive object.

The language of this inscription shows the very marked peculiarities which rank it close beside the language of the Iguvine Tables (*see* UMBRIAN). It shows on the one hand the labialization of the original velar *q* (Volscian *pis*=Latin *quis*), and on the other hand it palatalizes the guttural *c* before a following *i* (Volscian *façia*=Latin *faciat*). Like Umbrian also, it has degraded all the diphthongs into simple vowels.

The name *Volsci* belongs to the -CO- group of tribal names in the centre, and mainly on the west coast, of Italy, all of whom were subdued by the Romani before the end of the 4th century B.C.; and many of whom were conquered by the Samnites about a century or more earlier. They are, from south to north, *Osci, Aurunci, Hernici, Marruci, Falisci;* with these were no doubt associated the original inhabitants of *Aricia* and of *Sidici-num,* of *Vescia* among the *Aurunci,* and of *Labici* close to Hernican territory. The same formative element appears in the adjective *Mons Massicus,* and the names *Glanica* and *Marica* belonging to the Auruncan district, with *Graviscae* in south Etruria, and a few other names in central Italy. With these names must clearly be judged the forms *Tusci* and *Etrusci,* the names given to the Etruscans by the folk among whom they settled. The Samnite and Roman conquerors tended to impose the form of their own group-name, namely the suffix -NO-, upon the tribes they conquered; hence the *Marruci* became the *Marrucini,* the *Arici* became *Aricini.* The conclusion suggested is that these -CO- tribes occupied the centre and west coast of Italy at the time of the Etruscan invasion; whereas the -NO- tribes only reached this part of Italy, or at least only became dominant there, long after the Etruscans had settled in the Peninsula.

It remains, therefore, to ask whether any information can be had about the language of this primitive -CO- folk. If the conclusions suggested under SABINI may be accepted as sound we should expect to find the Volsci speaking a language similar to that of the Ligures, whose fondness for the suffix *-sco-* is marked, and identical with that spoken by the plebeians of Rome, and that this branch of Indo-European preserved the original Indo-European Velars from the labialization which befell them in the speech of the Samnites. The language of the inscription of Velitrae offers at first sight a difficulty from this point of view, in the conversion which it shows of *q* to *p;* but the group-name of Velitrae is *Veliternus,* and the people are called on the inscription itself *Velestrom* (genitive plural); so that there is nothing to prevent our assuming that we have here a settlement of Sabines among the Volscian hills, with their language to some extent (*e.g.,* in the matter of the diphthongs and palatals) corrupted by that of the people round about them.

In the name *Volsci,* the older form *Volusci* clearly contains the word meaning "marsh," since the change of *velos-* to *volus-* is phonetically regular in Latin. The name *Marica* ("goddess of the salt-marshes") among the Aurunci appears also both on the coast of Picenum and among the Ligurians; Stephanus of Byzantium identified the Osci with the Siculi, who, there is reason to suspect, were kinsmen of the Ligures. In many marshy places this *-co-* or *-ca-* suffix is used. Besides the *Aurunci* and the *dea Marica* and the *intempestaeque Graviscae* (Virg., *Aen.* x. 184), we have the *Ustica cubans* of Horace (*Odes* i. 17, 11), the *Hernici* in the Trerus valley, *Satricum* and *Glanica* in the Pomptine marshes.

BIBLIOGRAPHY.—For the text and fuller account of the Volscian inscription, and for other records of the dialect, *see* R. S. Conway, *Italic Dialects,* pp. 267 sqq. *See* also Camb. Anc. Hist., vol. vii.

VOLSINII, an ancient town of Etruria, Italy. The older Volsinii occupied in all probability the isolated tufa rock, so strongly defended by nature, upon which in Roman times stood the town which Procopius calls Οὐρβιβεντὸς (*Urbs vetus,* the modern Orvieto). It had, and needed, no outer walls, being surrounded on all sides except the south-west by abrupt tufa cliffs; but a massive wall found by excavation on the south-west side of the town may have belonged to the acropolis. An Etruscan temple of the 4th cent. B.C. stood near the north-east extremity of the plateau. It measured 72 by 54 feet and had three *cellae;* and at the foot of the hill on the north a large Etruscan necropolis was found dating from the 5th century B.C. The tombs, con-

structed of blocks of stone and arranged in rows divided by passages, often had the name of the deceased on the façade. Many painted vases, etc., were found; some are in the Museo Civico at Orvieto. Tombs with paintings have also been found at Settecamini to the south-west of the town on the way to Bolsena.

Volsinii was reputed the richest of the twelve cities of Etruria. Wars between Volsinii and Rome are mentioned in 392, 308 and 294 B.C. Zonaras states that the city was destroyed by Fulvius Flaccus in 265–264 B.C. and removed elsewhere, though the old site continued to be inhabited. The new city was certainly situated on the hills on the north-east bank of the Lake of Bolsena (*Lacus Volsiniensis*), 12 m. W.S.W. of Orvieto, where many important antiquities have been found.

See P. Perali, *Orvieto Etrusca* (Rome, 1928), who proposes to identify Orvieto with the ancient *Fanum Voltumnae*.

VOLSTEAD, ANDREW J. (1860–), ex-congressman, born in Goodhue county, Minnesota. He was admitted to the bar in 1884 and has since been in practice at Granite Falls, Minnesota. Mr. Volstead was a member of the 58th to 67th Congresses (1903–23), 7th Minnesota district. He was the author of the Farmers' Co-Operative Act and of the "Volstead Act," the first step in the struggle to enforce the 18th Amendment to the Constitution regarding the prohibition of intoxicating liquors. The Volstead Act was passed Oct. 18, 1919, over the President's veto. Its most drastic feature, and the one most criticized, is the definition of intoxicating liquors as beverages containing "one-half of one per centum or more of alcohol by volume." Volstead has been legal adviser to the chief of the north-western dry enforcement district since Oct. 1925.

VOLTA, ALESSANDRO (1745–1827), Italian physicist, was born at Como on Feb. 18, 1745. He is celebrated as a pioneer of electrical science, after whom the "volt" is named. He was successively appointed professor of physics in the gymnasium of Como (1774) and to the newly founded chair of physics at Pavia in 1779. In 1777 and again in 1782 he journeyed through Switzerland, France, Germany, Holland and England, and became acquainted with many scientific celebrities. In 1791 he received the Copley medal of the Royal Society. In 1801 Napoleon called him to Paris, to show his experiments on contact electricity, and a medal was struck in his honour. He was made a senator of the kingdom of Lombardy. In 1815 the emperor of Austria made him director of the philosophical faculty of Padua. In 1819 he retired and settled in his native town, where he died on March 5, 1827. A statue was erected to his memory at Como. For Volta's electrical work, and his place in the history of discovery, *see* ELECTRICITY; also VOLTMETER.

VOLTA, the largest river of the coast of Upper Guinea, between the Gambia and the Niger, with a length of about 900 m. Its mouth and the greater part of its course are in British territory. Its lower course had been known since the discoveries of the Portuguese, from whom it received (15th century) its name on account of the winding nature of its stream. It was not, however, until the last fifteen years of the 19th century that the extent of its basin—extending far north within the bend of the Niger—was made known.

There are two main upper branches, the Black and the White Volta. Their sources lie on the grassy plateaux north of the forest belt of the Guinea coast, the Black Volta rising (as the Baule) in about 11° N., 4° 50′ W. Its course is at first east and north-east, to 12° 25′ N., at which point, after receiving a tributary from nearly 14° N.—the most northerly point of the basin—it turns sharply south. From the eleventh to the ninth parallel the river forms the boundary between the Northern Territories of the Gold Coast (British) and the French Ivory Coast colony. The southerly course of the stream ceases at 8° 15′ N. where it is deflected east, and even north, by a mountain range composed of sandstone and granite, which it finally breaks through by a narrow pass, in which its width is only some 60 yards. Elsewhere it has a general width of 150 to 200 yards. In 0° 50′ W. it receives the White Volta, which flows generally south from about 13° N. and likewise breaks through a narrow gap in the plateau escarpment. Both rivers shrink greatly in the dry season, reaching their lowest level at the end of January. Below the junction the Volta flows south-east and south, but turns east for 40 m. just north of 6°. In 7° 37′ N. it receives on the left bank a large tributary, the Oti, coming from 12° N. In its lower course, through the forest belt, the river has often a width of over half a mile, with a depth in places of 40 to 50 ft. in the rains, but in 6° 18′ N. it traverses a pass in which its width is narrowed to 30 yards. Its use as a water-way is limited by a number of rapids, the lowest of which occur in 6° 7′ N., above the trading port of Akuse. Its mouth is also obstructed during the greater part of the year by a bar. The river is usually navigable by small vessels from its mouth for about 60 miles.

See H. Hubert, "Sur un important phénomène de capture dans l'Afrique occidentale" (*Annales de Géographie*, 1912).

VOLTAIRE, FRANÇOIS MARIE AROUET DE (1694–1778), whose real name was François Marie Arouet simply, was born on Nov. 21, 1694 at Paris, and was baptized the next day. His father was François Arouet, a notary; his mother was Marie Marguerite Daumart or D'Aumard. Both father and mother were of Poitevin extraction, but the Arouets had been for two generations established in Paris, the grandfather being a prosperous tradesman. He was the fifth child of his parents. Not very much is known of the mother, who died when Voltaire was but seven years old. She pretty certainly was the chief cause of his early introduction to good society, the abbé de Châteauneuf (his sponsor in more ways than one) having been her friend.

The abbé instructed him early in belles-lettres and deism, and he showed when a child an unsurpassed faculty for facile verse-making. At the age of ten he was sent to the Collège Louis-le-Grand, which was under the management of the Jesuits, and remained there till 1711. It was his whim, as part of his general liberalism, to depreciate the education he received; but it seems to have been a sound and good education. Nor can there be much doubt that the great attention bestowed on acting—the Jesuits kept up the Renaissance practice of turning schools into theatres for the performance of plays both in Latin and in the vernacular—had much to do with Voltaire's lifelong devotion to the stage. It must have been in his very earliest school years that the celebrated presentation of him by his godfather to Ninon de Lenclos took place, for Ninon died in 1705. She left him two thousand francs "to buy books with."

In August 1711, at the age of seventeen, he came home, and the usual battle followed between a son who desired no profession but literature and a father who refused to consider literature a profession at all. For a time Voltaire submitted, and read law at least nominally. The abbé de Châteauneuf died before his godson left school, but he had already introduced him to the famous and dissipated coterie of the Temple. His father tried to break him off from such society by sending him in the suite of the marquis de Châteauneuf, the abbé's brother, to The Hague. Here he met a certain Olympe Dunoyer ("Pimpette"), a girl apparently of respectable character and not bad connections, but a Protestant, penniless, and daughter of a literary lady whose literary reputation was not spotless. His father stopped any idea of a match by procuring a *lettre de cachet*, which, however, he did not use. Voltaire, who had been sent home, submitted, and for a time pretended to work in a Parisian lawyer's office; but he again manifested a faculty for getting into trouble—this time in the still more dangerous way of writing libellous poems—so that his father was glad to send him to stay for nearly a year (1714–15) with Louis de Caumartin, marquis de Saint-Ange, in the country. When he returned to Paris, Voltaire was forthwith introduced to a less questionable and even more distinguished coterie than Vendôme's, to the famous "court of Sceaux," the circle of the beautiful and ambitious duchesse du Maine. It seems that Voltaire lent himself to the duchess's frantic hatred of the regent Orleans, and helped to compose lampoons on that prince. At any rate, in May 1716 he was exiled, first to Tulle, then to Sully. Allowed to return, he again fell under suspicion of having been concerned in the composition of two violent libels and on May 16, 1717 was sent to the Bastille. He there recast *Oedipe*, began the *Henriade* and determined to alter his name. Ever after his exit

from the Bastille in April 1718 he was known as Arouet de Voltaire, or simply Voltaire, though legally he never abandoned his patronymic. Probably the name is an anagram on "Arouet le jeune," or "Arouet l. j."

A further "exile" at Châtenay and elsewhere succeeded the imprisonment, and though Voltaire was admitted to an audience by the regent and treated graciously he was not trusted. *Oedipe* was acted at the Théâtre Français on Nov. 18 of the year of release. It had a run of forty-five nights, and brought the author not a little profit. With these gains Voltaire seems to have begun his long series of successful financial speculations. But in the spring of next year the production of Lagrange-Chancel's libels, entitled the *Philippiques*, again brought suspicion on him. He was informally exiled, and spent much time with Marshal Villars, again increasing his store of "reminiscences." He returned to Paris in the winter, and his second play, *Artémire*, was produced in February 1720. It was a failure. In December 1721 his father died, leaving him property (rather more than four thousand livres a year), which was soon increased by a pension of half the amount from the regent. In return he offered himself as a secret diplomatist to Dubois.

His visiting espionage, as unkind critics put it—his secret diplomatic mission, as he would have liked to have it put himself—began in the summer of 1722, and he set out for it in company with a certain Madame de Rupelmonde, to whom he as usual made love, taught deism and served as an amusing travelling companion. He stayed at Cambrai for some time, where European diplomatists were still in full session, journeyed to Brussels, went on to The Hague, and then returned. The *Henriade* had got on considerably during the journey. During the late autumn and winter of 1722–23 he abode chiefly in Paris, taking a kind of lodging in the town house of M. de Bernières, a nobleman of Rouen, and endeavouring to procure a "privilege" for his poem. In this he was disappointed, but he had the work printed at Rouen nevertheless, and spent the summer of 1723 revising it. In November he caught smallpox and was very seriously ill. The book was privately printed in the spring of 1724. His third tragedy, *Mariamne* was a failure. The regent had died shortly before, not to Voltaire's advantage; for he had been a generous patron. Voltaire had made, however, a useful friend in another *grand seigneur*, as profligate and nearly as intelligent, the duke of Richelieu, and with him he passed 1724 and the next year chiefly, recasting *Mariamne* (which was now successful), writing the comedy of *L'Indiscret*, and courting the queen, the ministers, the favourites and all who seemed worth while. The end of 1725 brought a disastrous close to this period of his life. He was insulted by the chevalier de Rohan, replied with his usual sharpness of tongue, and shortly afterwards, when dining with the duke of Sully, was called out and bastinadoed by the chevalier's hirelings, Rohan himself looking on. Nobody would take his part, and at last, nearly three months after the outrage, he challenged Rohan, who accepted the challenge, but on the morning appointed for the duel Voltaire was arrested and sent for the second time to the Bastille. He was kept in confinement a fortnight, and was then packed off to England in accordance with his own request. Voltaire revenged himself on the duke of Sully for his conduct towards his guest by cutting Maximilien de Béthune's name out of the *Henriade*.

Voltaire's visit to England lasted about three years, from 1726 to 1729. George II., who succeeded soon after his arrival, was not fond of "boetry," but Queen Caroline was, and international jealousy was pleased at the thought of welcoming a distinguished exile from French illiberality. The Walpoles, Bubb Dodington, Bolingbroke, Congreve, Sarah, duchess of Marlborough, Pope, were among his English friends. He made acquaintance with, and at least tried to appreciate, Shakespeare. He was much struck by English manners, was deeply penetrated by English toleration for personal freethought and eccentricity, and gained some thousands of pounds from an authorized English edition of the *Henriade*, dedicated to the queen. But he visited Paris now and then and gained full licence to return in the spring of 1729.

He was full of literary projects, and immediately after his return he is said to have increased his fortune immensely by a lucky lottery speculation. The *Henriade* was at last licensed in France; *Brutus*, a play which he had printed in England, was accepted for performance, but kept back for a time by the author; and he began the celebrated poem of the *Pucelle*, the amusement and the torment of a great part of his life. At the end of 1730 *Brutus* did actually get acted. Then in the spring of the next year he went to Rouen to get *Charles XII.* surreptitiously printed, which he accomplished. In 1732 another tragedy, *Ériphile*, appeared, with the same kind of halting success which had distinguished the appearance of its elder sisters since *Oedipe*. But at last, on the 13th of August 1732, he produced *Zaïre*, the best (with *Mérope*) of all his plays, and one of the ten or twelve best plays of the whole French classical school. Its motive was borrowed to some extent from *Othello*, but that matters little. In the following winter the death of the comtesse de Fontaine-Martel, whose guest he had been, turned him out of a comfortable abode. He then took lodgings with an agent of his, one Demoulin, in an out-of-the-way part of Paris, and was, for some time at least, as much occupied with contracts, speculation and all sorts of means of gaining money as with literature.

In the middle of this period, however, in 1733, two important books, the *Lettres philosophiques sur les Anglais* and the *Temple du goût* appeared. Both were likely to make bad blood, for the latter was, under the mask of easy verse, a satire on contemporary French literature, especially on J. B. Rousseau, and the former was, in the guise of a criticism or rather panegyric of English ways, an attack on everything established in the church and state of France. The book was condemned (June 10th, 1734, the copies seized and burnt, a warrant issued against the author and his dwelling searched. He himself was safe in the independent duchy of Lorraine with Émilie de Breteuil, marquise du Châtelet, with whom he began to be intimate in 1733. The château of Cirey, a half-dismantled country house on the borders of Champagne and Lorraine, was fitted up with Voltaire's money and became the headquarters of himself, of his hostess, and now and then of her accommodating husband. Many pictures of the life here, some of them not a little malicious, survive. It was not entirely a bed of roses, for the "respectable Emily's" temper was violent, and after a time she sought lovers who were not so much *des cérébraux* as Voltaire. But it provided him with a safe and comfortable retreat, and with every opportunity for literary work. In March 1735 the ban was formally taken off him, and he was at liberty to return to Paris, a liberty of which he availed himself sparingly.

At Cirey he wrote indefatigably and did not neglect business. The principal literary results of his early years here were the *Discours en vers sur l'homme*, the play of *Alzire* and *L'Enfant prodigue* (1736), and a long treatise on the Newtonian system which he and Madame du Châtelet wrote together. In the first days of his sojourn he had written a pamphlet with the title of *Treatise on Metaphysics*. Of metaphysics proper Voltaire neither then nor at any other time understood anything, and the subject, like every other, merely served him as a pretext for laughing at religion with the usual reservation of a tolerably affirmative deism. In March 1736 he received his first letter from Frederick of Prussia, then crown prince only. He was soon again in trouble, this time for the poem of *Le Mondain*, and he at once crossed the frontier and then made for Brussels. He spent about three months in the Low Countries, and in March 1737 returned to Cirey, and continued writing, making experiments in physics (he had at this time a large laboratory), and busying himself with iron-founding, the chief industry of the district. The best-known accounts of Cirey life, those of Madame de Grafigny, date from the winter of 1738–39; they are somewhat spiteful but very amusing, depicting the frequent quarrels between Madame du Châtelet and Voltaire, his intense suffering under criticism, his constant dread of the surreptitious publication of the *Pucelle* (which nevertheless he could not keep his hands from writing or his tongue from reciting to his visitors), and so forth. Frederick, now king of Prussia, made not a few efforts to get Voltaire away from Madame du Châtelet, but unsuccessfully,

and the king earned the lady's cordial hatred by persistently refusing or omitting to invite her. At last, in September 1740, master and pupil met for the first time at Cleves, an interview followed three months later by a longer visit. Brussels was again the headquarters in 1741, by which time Voltaire had finished the best and the second or third best of his plays, *Mérope* and *Mahomet*. *Mahomet* was played first at Lille in that year; it did not appear in Paris till August next year, and *Mérope* not till 1743. This last was, and deserved to be, the most successful of its author's whole theatre. During these years much of the *Essai sur les moeurs* and the *Siècle de Louis XIV.* was composed. He also returned, not too well-advisedly, to the business of courtiership, which he had given up since the death of the regent. He was much employed, owing to Richelieu's influence, in the fêtes of the dauphin's marriage, and was rewarded, through the influence of Madame de Pompadour on, New Year's Day 1745 by the appointment to the post of historiographer-royal, once jointly held by Racine and Boileau. In the same year he wrote a poem on Fontenoy, he received medals from the pope and dedicated *Mahomet* to him, and he wrote court *divertissements* and other things to admiration. But Voltaire, who had been for years the first writer in France, had been repeatedly passed over in elections to the Academy. He was at last elected in the spring of 1746, and received on the 9th of May. Then the tide began to turn. His favour at court had naturally exasperated his enemies. He had various proofs of the instability of his hold on the king during 1747 and in 1748. He once lay in hiding for two months with the duchesse du Maine at Sceaux, where were produced the comedietta of *La Prude* and the tragedy of *Rome sauvée*, and afterwards for a time lived chiefly at Lunéville; here Madame du Châtelet had established herself at the court of King Stanislaus, and carried on a liaison with Saint-Lambert, an officer in the king's guard. In 1749 she died after the birth of a child.

After Madame du Châtelet's death Voltaire had some idea of settling in Paris, but mischief was the very breath of his nostrils. He went on writing satiric tales like *Zadig*. He engaged in a foolish and undignified struggle with Crébillon *père* (not *fils*), a rival set up against him by Madame de Pompadour, but a dramatist who, in part of one play, *Rhadamiste et Zénobie*, has struck a note of tragedy in the grand Cornelian strain, which Voltaire could never hope to echo. *Semirame* (1748), *Oreste* (1750) and *Rome sauvée* itself were all products of this rivalry.

All this time Frederick of Prussia had been continuing his invitations. Voltaire left Paris on June 15, 1751, and reached Berlin on July 10. It is certain that at first the king behaved altogether like a king to his guest. He pressed him to remain; he gave him (the words are Voltaire's own) one of his orders, twenty thousand francs a year, and four thousand additional for his niece, Madame Denis, in case she would come and keep house for her uncle. His residence in Prussia lasted nearly three years. It was quite impossible that Voltaire and Frederick should get on together for long. Voltaire was not humble enough to be a mere butt, as many of Frederick's led poets were; he was not enough of a gentleman to hold his own place with dignity and discretion; he was constantly jealous both of his equals in age and reputation, such as Maupertuis, and of his juniors and inferiors, such as Baculard D'Arnaud. He was greedy, restless, and in a way Bohemian. He tried to get D'Arnaud exiled, and succeeded. He got into a quite unnecessary quarrel with Lessing. He had not been in the country six months before he engaged in a discreditable piece of financial gambling with Hirsch, the Dresden Jew. He was accused of something like downright forgery—that is to say, of altering a paper signed by Hirsch after he had signed it. The king's disgust at this affair (which came to an open scandal before the tribunals) was so great that he was on the point of ordering Voltaire out of Prussia, and Darget the secretary had no small trouble in arranging the matter (February 1751). Then it was Voltaire's turn to be disgusted with an occupation he had undertaken himself—the occupation of "buckwashing" the king's French verses. However, he succeeded in finishing and printing the *Siècle de Louis XIV.*, while the *Dictionnaire philosophique* is said to have been devised and begun at Potsdam.

But Voltaire's restless temper was brewing up for another storm. In the early autumn of 1751 La Mettrie, one of the king's parasites, and a man of much more talent than is generally allowed, horrified Voltaire by telling him that Frederick had in conversation applied to him (Voltaire) a proverb about "sucking the orange and flinging away its skin," and about the same time the dispute with Maupertuis, which had more than anything else to do with his exclusion from Prussia, came to a head. Maupertuis got into a dispute with one König. The king took his president's part; Voltaire took König's. But Maupertuis must needs write his *Letters*, and thereupon (1752) appeared one of Voltaire's most famous, though perhaps not one of his most read works, the *Diatribe du Docteur Akakia*. Even Voltaire did not venture to publish this lampoon on a great official of a prince so touchy as the king of Prussia without some permission, and if all tales are true he obtained this by another piece of something like forgery—getting the king to endorse a totally different pamphlet on its last leaf, and affixing that last leaf to *Akakia*. Of this Frederick was not aware; but he did get some wind of the *Diatribe* itself, sent for the author, heard it read to his own great amusement, and either actually burned the ms. or believed that it was burnt. In a few days printed copies appeared. Frederick put Voltaire under arrest for a time. After repeated reconciliations followed by fresh difficulties Voltaire at last left Potsdam on the 26th of March, 1753. It was nearly three months afterwards that the famous, ludicrous and brutal arrest was made at Frankfort, on the persons of himself and his niece, who had met him meanwhile. The whole situation was at last put an end to by the city authorities, who probably felt that they were not playing a very creditable part. Voltaire left Frankfort on July 7, and travelled to Colmar.

Voltaire's second stage was now over in his sixtieth year. He had been, in the first blush of his Frankfort disaster, refused, or at least not granted, permission even to enter France proper. At Colmar he was not safe, especially when in January 1754 a pirated edition of the *Essai sur les moeurs*, written long before, appeared. Permission to establish himself in France was now absolutely refused. Nor did an extremely offensive performance of Voltaire's—the solemn partaking of the Eucharist at Colmar after due confession—at all mollify his enemies. His exclusion from France, however, really meant exclusion from Paris and its neighbourhood. In the summer he went to Plombières, and after returning to Colmar for some time journeyed in the beginning of winter to Lyons, and thence in the middle of December to Geneva. Voltaire had no purpose of remaining in the city, and almost immediately bought a country house just outside the gates, to which he gave the name Les Délices. He was here practically at the meeting-point of four distinct jurisdictions—Geneva, the canton Vaud, Sardinia and France, while other cantons were within easy reach; and he bought other houses dotted about these territories, so as never to be without a refuge close at hand in case of sudden storms. At Les Délices he set up a considerable establishment, which his great wealth made him able easily to afford. He kept open house for visitors; he had printers close at hand in Geneva; he fitted up a private theatre in which he could enjoy what was perhaps the greatest pleasure of his whole life—acting in a play of his own, stage-managed by himself. His residence at Geneva brought him into correspondence (at first quite amicable) with the most famous of her citizens, J. J. Rousseau. His *Orphelin de la Chine*, performed at Paris in 1755, was very well received; the notorious *La Pucelle* appeared in the same year. The earthquake at Lisbon, which appalled other people, gave Voltaire an excellent opportunity for ridiculing the beliefs of the orthodox, first in verse (1756) and later in the (from a literary point of view) unsurpassable tale of *Candide* (1759). All was, however, not yet quite smooth with him. Geneva had a law expressly forbidding theatrical performances in any circumstances whatever. Voltaire had infringed this law already as far as private performances went, and he had thought of building a regular theatre, not indeed at Geneva but at Lausanne. He undoubtedly instigated D'Alembert to include a censure of the prohibition in his *Encyclopédie* article on

"Geneva," a proceeding which provoked Rousseau's celebrated *Lettre à D'Alembert sur les spectacles*. As for himself, he looked about for a place where he could combine the social liberty of France with the political liberty of Geneva, and he found one.

At the end of 1758 he bought the considerable property of Ferney, on the shore of the lake, about four miles from Geneva, and on French soil. Many of the most celebrated men of Europe visited him there. In spite of these interruptions he wrote much and conducted an immense correspondence, which had for a long time once more included Frederick, the two getting on very well when they were not in contact. Above all, he now, being comparatively secure in position, engaged much more strongly in public controversies, and resorted less to his old labyrinthine tricks of disavowal, garbled publication and private libel. The suppression of the *Encyclopédie*, to which he had been a considerable contributor, and whose conductors were his intimate friends, drew from him a shower of lampoons directed now at "l'infâme" (see *infra*) generally, now at literary victims, such as Le Franc de Pompignan, or Palissot or at Fréron, an excellent critic and a dangerous writer, who had attacked Voltaire from the conservative side, and at whom the patriarch of Ferney, as he now began to be called, levelled the farce-lampoon of *L'Écossaise*.

Here, too, he began that series of interferences on behalf of the oppressed and the ill-treated which is an honour to his memory. Volumes and almost libraries have been written on the Calas affair, and we can but refer here to the only less famous cases of Sirven (very similar to that of Calas, though no judicial murder was actually committed), Espinasse (who had been sentenced to the galleys for harbouring a Protestant minister), Lally (the son of the unjustly treated but not blameless Irish-French commander in India), D'Étalonde (the companion of La Barre), Montbailli and others.

In this way Voltaire, who had been an old man when he established himself at Ferney, became a very old one almost without noticing it. The death of Louis XV. and the accession of Louis XVI. excited even in his aged breast the hope of re-entering Paris, but he did not at once receive any encouragement, despite the reforming ministry of Turgot. A much more solid gain to his happiness was the adoption, or practical adoption, in 1776 of Reine Philiberte de Varicourt, a young girl of noble but poor family, whom Voltaire rescued from the convent, installed in his house as an adopted daughter, and married to the marquis de Villette. Her pet name was "Belle et Bonne," and nobody had more to do with the happiness of the last years of the "patriarch" than she had. It is doubtful whether his last and fatal visit to Paris was due to his own wish or to the instigation of his niece, Madame Denis. At the end of 1777 and the beginning of 1778, he had been carefully finishing a new tragedy—*Irène*—for production in the capital. He started on Feb. 5, and five days later arrived at the city which he had not seen for 28 years.

He was received with immense rejoicings, not indeed directly by the court, but by the Academy, by society and by all the more important foreign visitors. About a fortnight after his arrival, age and fatigue made him seriously ill, and a confessor was sent for. But he recovered, scoffed at himself as usual, and prepared more eagerly than ever for the first performance of *Irène*, on March 16. At the end of the month he was able to attend a performance of it, which was a kind of apotheosis. He was crowned with laurel in his box, amid the plaudits of the audience, and did not seem to be the worse for it. He even began or proceeded with another tragedy—*Agathocle*—and attended several Academic meetings. But such proceedings in the case of a man of eighty-four were impossible. To keep himself up, he exceeded even his usual excess in coffee, and about the middle of May he became very ill. On May 30, the priests were once more sent for—to wit, his nephew, the abbé Mignot, the abbé Gaultier, who had officiated on the former occasion, and the parish priest, the curé of St. Sulpice. In a state of half-insensibility he petulantly motioned them away, dying in the course of the night. The result was a difficulty as to burial, which was compromised by hurried interment at the abbey of Scellières in Champagne, anticipating the interdict of the bishop of the diocese by an hour or two. On July 10, 1791 the body was transferred to the Pantheon, but during the Hundred Days it was once more, it is said, disentombed, and stowed away in a piece of waste ground. His heart, taken from the body when it was embalmed, and given to Madame Denis and by her to Madame de Villette, was preserved in a silver case, and when it was proposed (in 1864) to restore it to the other remains, the sarcophagus at Sainte Geneviève (the Pantheon) was opened and found to be empty.

In person Voltaire was not engaging, even as a young man. His extraordinary thinness is commemorated, among other things, by the very poor but well-known epigram attributed to Young, and identifying him at once with "Satan, Death and Sin." In old age he was a mere skeleton, with a long nose and eyes of preternatural brilliancy peering out of his wig. He never seems to have been addicted to any manly sport, and took little exercise. He was sober enough (for his day and society) in eating and drinking generally; but drank coffee, as his contemporary, counterpart and enemy, Johnson, drank tea, in a hardened and inveterate manner. It may be presumed with some certainty that his attentions to women were for the most part platonic; indeed, both on the good and the bad side of him, he was all brain. Conversation and literature were, again as in Johnson's case, gods of his idolatry. He was good-natured when not crossed, generous to dependents who made themselves useful to him, and indefatigable in defending the cause of those who were oppressed by the systems with which he was at war. But he was inordinately vain, and totally unscrupulous in gaining money, in attacking an enemy, or in protecting himself when he was threatened with danger. Voltaire's works, and especially his private letters, constantly contain the word "l'infâme" and the expression (in full or abbreviated) "écrasez l'infâme." This has been misunderstood in many ways—the mistake going so far as in some cases to suppose that Voltaire meant Christ by this opprobrious expression. No careful and competent student of his works has ever failed to correct this gross misapprehension. "L'infâme" is not God; it is not Christ; it is not Christianity; it is not even Catholicism. Its briefest equivalent may be given as "persecuting and privileged orthodoxy" in general, and, more particularly, it is the particular system which Voltaire saw around him, of which he had felt the effects in his own exiles and the confiscations of his books, and of which he saw the still worse effects in the hideous sufferings of Calas and La Barre.

Works.—Vast and various as his work is, its vastness and variety are of the essence of its writer's peculiar quality. The divisions of it have long been recognized, and may be treated regularly.

The first of these divisions in order is the *theatre*. Between fifty and sixty pieces (including a few which exist only in fragments or sketches) are included in his writings, and they cover his literary life. It is at first sight remarkable that Voltaire, whose comic power was undoubtedly far in excess of his tragic, should have written many tragedies of no small excellence in their way, but only one fair second-class comedy, *Nanine*. His tragedies, on the other hand, are works of extraordinary merit in their own way. *Zaïre*, among those where love is admitted as a principal motive, and *Mérope*, among those where this motive is excluded and kept in subordination, yield to no plays of their class.

As regards his *poems* proper, of which there are two long ones, the *Henriade* and the *Pucelle*, besides smaller pieces, of which a bare catalogue fills fourteen royal octavo columns, their value is very unequal. The *Pucelle* is extremely desultory; it is a libel on religion and history. But it is amusing. The minor poems are as much above the *Pucelle* as the *Pucelle* is above the *Henriade*. It is true that there is nothing, or hardly anything, that properly deserves the name of poetry in them—no passion, no sense of the beauty of nature, only a narrow "criticism of life," only a conventional and restricted choice of language, a cramped and monotonous prosody, and none of that indefinite suggestion which has been rightly said to be of the poetic essence. But there is immense wit, a wonderful command of such metre and language as the taste of the time allowed to the poet, a singular if somewhat artificial grace, and great felicity of diction.

The third division of Voltaire's works in a rational order consists of his *prose romances* or *tales*. In these admirable works more than in any others that the peculiar quality of Voltaire—ironic style without exaggeration—appears. That he learned it partly from Saint Evremond, still more from Anthony Hamilton, partly even from his own enemy Le Sage, is perfectly true, but he gave it perfection and completion. If one especial peculiarity can be singled out, it is the extreme restraint and simplicity of the verbal treatment. Voltaire never dwells too long on this point, stays to laugh at what he has said, elucidates or comments on his own jokes, guffaws over them or exaggerates their form. The famous "pour encourager les autres" is an typical example, and indeed the whole of *Candide* shows the style at its perfection.

The fourth division of Voltaire's work, the *historical*, is the bulkiest of all except his correspondence, but it is far from being among the best. The small treatises on Charles XII. and Peter the Great are indeed models of clear narrative and ingenious if somewhat superficial grasp and arrangement. The so-called *Siècle de Louis XIV.* and *Siècle de Louis XV.* (the latter inferior to the former but still valuable) contain a great miscellany of interesting matter, treated by a man of great acuteness and unsurpassed power of writing, who had also had access to much important private information. But even in these books defects are present, which appear much more strongly in the singular ollapodrida entitled *Essai sur les moeurs*, in the *Annales de l'empire* and in the minor historical works. These defects are an almost total absence of any comprehension of what has since been called the philosophy of history, the constant presence of gross prejudice, frequent inaccuracy of detail, and, above all, a complete incapacity to look at anything except from the narrow standpoint of a half-pessimist and half self-satisfied *philosophe*.

To his own age Voltaire was pre-eminently a poet and a philosopher; the unkindness of succeeding ages has sometimes questioned whether he had any title to either name, and especially to the latter. His largest *philosophical* work, at least so called, is the curious medley entitled *Dictionnaire philosophique*, which is compounded of the articles contributed by him to the great *Encyclopédie* and of several minor pieces. No one of Voltaire's works shows his anti-religious or at least anti-ecclesiastical animus more strongly. The various title-words of the several articles are often the merest stalking-horses, under cover of which to shoot at the Bible or the church, the target being now and then shifted to the political institutions of the writer's country, his personal foes, etc., and the whole being largely seasoned with that acute, rather superficial, common-sense, but also commonplace, ethical and social criticism which the 18th century called philosophy. The book ranks perhaps second only to the novels as showing the character, literary and personal, of Voltaire; and despite its form it is nearly as readable.

In general *criticism* and *miscellaneous* writing Voltaire is not inferior to himself in any of his other functions. Almost all his more substantive works, whether in verse or prose, are preceded by prefaces of one sort or another, which are models of his own light pungent *causerie;* and in a vast variety of nondescript pamphlets and writings he shows himself a perfect journalist.

There remains only the huge division of his *correspondence*, which is constantly being augmented by fresh discoveries, and which, according to Georges Bengesco, has never been fully or correctly printed, even in some of the parts longest known. In this great mass Voltaire's personality is of course best shown, and perhaps his literary qualities not worst. His immense energy and versatility, his adroit and unhesitating flattery when he chose to flatter, his ruthless sarcasm when he chose to be sarcastic, his rather unscrupulous business faculty, his more than rather unscrupulous resolve to double and twist in any fashion so as to escape his enemies,—all these things appear throughout the whole mass of letters.

When sympathy and dislike are both discarded or allowed for, he remains one of the most astonishing, if not exactly one of the most admirable, figures of letters. His great fault was an inveterate superficiality. But this superficiality was accompanied by such wonderful acuteness within a certain range, by such an absolutely unsurpassed literary aptitude and sense of style in all the lighter and some of the graver modes of literature, by such untiring energy and versatility in enterprise, that he has no parallel among ready writers anywhere. Not the most elaborate work of Voltaire is of much value for matter; but not the very slightest work of Voltaire is devoid of value in form. In literary craftsmanship, at once versatile and accomplished, he has no superior and scarcely a rival.

Jackson, 1926); *Candide and other romances* (trans. R. Aldington, 1927); V. Thaddeus, *Voltaire, Genius of Mockery* (1928).

VOLTERRA (anc. *Volaterrae*), a town and episcopal see of Tuscany, Italy, in the province of Pisa, from which it is 51 m. by rail S.E., and 35 by road W.N.W. from Siena. Pop. (1921) 8,155 (town); 16,597 (commune). It stands on a commanding olive-clad eminence 1,785 ft. above sea-level, with a magnificent view over mountains and sea (the latter some 20 m. distant), and is surrounded by the massive remains of its ancient walls of large, roughly-rectangular blocks of stone, some 4½ m. in circuit, enclosing an area which must have been larger than was actually needed for habitation. Tombs of the later Villanova period (end of the 9th century B.C.) have been found within its circuit, but only at the north-west extremity. Here the clay of which the hill is formed is gradually giving way, causing landslips and the collapse of buildings, notably of the abbey church of S. Salvatore (1030) and SS. Giusto e Clemente. The mediaeval town occupies only the southern portion of this area. The most important relic of its Etruscan period is the Porta dell' Arco, an archway 20 ft. high, the corbels of which are adorned with almost obliterated heads. Volterra contains many picturesque mediaeval towers and houses. The Palazzo dei Priori (1208–57), containing the picture gallery, is especially fine, and the Piazza Maggiore in which it stands most picturesque. The museum contains a valuable collection of Etruscan antiquities, especially cinerary urns from ancient tombs of alabaster, with the figure of the deceased on the lid, and reliefs from Greek myths on the front. They belong to the 3rd and 2nd centuries B.C. The cathedral, enlarged and adorned by Pisan artists in 1254, has a fine pulpit of that period, and on the high altar are sculptures by Mino da Fiesole; it contains several good pictures. The sacristy has fine carvings. The baptistery (1283) has a font by Andrea Sansovino, and a ciborium by Mino da Fiesole. Both these buildings are in black and white marble. S. Francesco has frescoes of 1410, and S. Girolamo terra-cottas by Giovanni della Robbia and pictures. The inhabitants are chiefly employed in the manufacture of vases and other ornaments from alabaster found in the vicinity.

Volaterrae (Etruscan *Velathri*) was one of the most powerful of the 12 confederate cities of Etruria. During the war between Marius and Sulla it withstood the latter's troops for two years in 82–80 B.C. In the 12th and 13th centuries it enjoyed free institutions; in 1361 it fell under the power of Florence. It rebelled but was retaken and pillaged in 1472.

See C. Ricci, *Volterra* (Bergamo, 1905); R. MacIver, *Villanovans and Early Etruscans* (Oxford, 1924) 63–65. (T. A.)

VOLTMETER, an instrument which indicates the difference of the electric potential between its terminals on a scale graduated in volts. Legally, the (international) volt is the electromotive force which produces a current of one (international) ampere in a resistance of one (international) ohm. This volt is equal to $1{\cdot}00649 \times 10^8$ absolute C.G.S. units. Voltmeters are always connected in parallel across the points whose potential difference is required to be measured, and, since it is essential not to disturb

this potential difference, they must have a high resistance so that they may pass only a very small current. They may be divided into two classes, (a) electrostatic, (b) electrokinetic. Electrostatic voltmeters depend for their action on the fact that when two conductors are at different potentials they attract each other with a force which varies as the square of the potential difference between them. Such voltmeters have the advantage of possessing an infinite resistance, but they are not very suitable for the measurement of small voltages (*e.g.*, 100 volts). Electrokinetic voltmeters are simply high resistance galvanometers, and measure potential differences in terms of the minute currents which pass through them when they are connected to the points whose potential differences are required. (*See* INSTRUMENTS, ELECTRICAL.)

VOLTURNO, a river of central Italy, which rises in the neighbourhood of Alfedena in the central Apennines of Samnium, runs south as far as Venafro, and then south-east. After a course of some 75 m. it receives, about 5 m. E. of Caiazzo, the Calore. The united stream now flows west-south-west past Capua (anc. *Casilinum*), where the Via Appia and Latina joined just to the north of the bridge over it, and so through the Campanian plain, with many windings, into the sea. The direct length of the lower course is about 31 m., so that the whole is slightly longer than that of the Liri, and its basin far larger (1,953 sq.m. with a length of 100 m. in a straight line and a discharge of 40 cubic metres per second at the mouth). The river has always had considerable military importance, and the colony of Volturnum (no doubt preceded by an older port of Capua) was founded in 194 B.C. at its mouth on the south bank by the Romans; it is now about one mile inland. A fort had already been placed there during the Roman siege of Capua, in order, with Puteoli, to serve for the provisioning of the army. The river was navigable as far as Capua.

On Oct. 1, 1860, the Neapolitan forces were defeated on the S. bank of the Volturno, near S. Maria di Capua Vetere, by the Piedmontese and Garibaldi's troops, a defeat which led to the fall of Capua.

VOLUNTEERS, a general term for soldiers who are not professionals nor permanently embodied under arms in peace. The idea of a large organized Volunteer force seems to have originated in England at the time of the Militia bill of 1757, which was amended in 1758 so as to allow the militia captains to accept volunteers instead of the ordinary militiamen who were compulsorily furnished *pro rata* by each parish. In 1778 the volunteers were still voluntary substitutes for militiamen, though formed in separate companies of the militia unit, but volunteer corps soon began to form themselves independently of the militia.

These volunteers, disbanded in 1783, were promptly revived when the French Revolutionary Wars produced a new enemy. When the danger of invasion was at its height the force numbered 380,000 men, or 3½% of a population which already kept up a regular army and a militia. In 1808 the Local Militia was formed, in which enlistment and training were both stricter and better defined and the greater part of the volunteers transferred themselves to this body. By 1812 the Local Militia reached a strength of 215,000 as against the 70,000 of the remaining volunteers. With the general peace of 1814 almost all of these forces disappeared.

After an interval of nearly half a century the warlike attitude of France caused British citizens once more to arm for the protection of their country.

The enrolment of the "Volunteer Force" took place at first under the old statute (44 Geo. III.). The main provisions of that act, however, were found inapplicable to the altered conditions under which invasion was now possible. A new act (Volunteer Act, 1863) was soon passed, the most important provision of which was that apprehended invasion should constitute a sufficient reason for the sovereign to call out the volunteers, in lieu of the old condition which required the actual appearance of the enemy. This was modified in 1900 during the South African War by a further enactment allowing the authorities to call them out at times of "imminent national danger and great emergency." The formation of volunteer corps was so rapid that in the course of a few months in 1859–60 a force of 119,000 was created. The Government, which in the beginning had tolerated rather than encouraged the movement, and had required the volunteer to serve and to equip himself entirely at his own expense, now followed the lead of a public opinion, and decided on maintaining the volunteer force as a part of the regular defensive system.

The turning-point in the history of the volunteers was the South African War. In Jan. 1900, and on several subsequent occasions, the volunteers were invited to supply service companies for South Africa, to be incorporated in the regular battalions to which the volunteer battalions were affiliated. About one-third of the whole force volunteered for service in South Africa besides a great number of volunteers whom the higher pay, easier conditions, and better prospects of active employment in the mounted guerrilla warfare tempted into the ranks of the yeomanry. Various partial reorganizations followed in 1902–5 and at least in 1907–8, the whole force was re-cast, and organized along with the yeomanry into the new Territorial force. (*See* TERRITORIAL ARMY; GREAT BRITAIN: *Army*.)

United States.—The United States has always maintained only a small regular army, and until the World War depended largely upon volunteers in case of national emergency. In the War of 1812 volunteers, rangers and militia numbered 458,460 as against 56,000 regulars. The Mexican war was fought by a larger proportion of regular troops. The President's call for 50,000 volunteers was quickly responded to but food and transportation were not so quickly supplied and thousands of volunteers had to be left behind or sent home again. The main dependence of both sides during the Civil War was upon volunteer troops. The chief difficulties about the volunteer system for the North were the short enlistment terms and the fact that the law gave the governors of states the right to appoint the officers of volunteer regiments. Voluntary enlistment also failed to produce enough troops for an emergency and a forced draft was resorted to. In the Spanish-American War the President was authorized to call out volunteers for a two-year term. Under this act 220,000 volunteers were raised who together with 60,000 regulars formed the United States army during the War. The Volunteer Army Bill of Apr. 25, 1914, did away with the old provisions that the officers of volunteer troops must be appointed by State governors and stipulated that all officers were to be appointed by the President. Also no volunteer was to be appointed to any rank above the grade of colonel.

In the World War the United States definitely abandoned the volunteer system as the basis of its army and resorted at once to a selective draft. Nevertheless the Selective Service Act permitted voluntary enlistment by persons between the ages of 18 and 40, and at the outset enlistment was freely open to persons registered for the draft, provided that such registrants had not yet been called up for examination by their local boards. Regulations issued Dec. 15, 1917, however, prohibited voluntary enlistment for draft registrants. In August, 1918, further volunteering of any kind ceased by order of the War department. Down to that time voluntary enlistments had numbered 399,874 in the regular army, 296,978 in the national guard units, 424,424 in the navy and 51,223 in the marine corps.

VOLUSENUS, FLORENTIUS [FLORENCE WOLSON, or WOLSEY, in later writers WILSON, though in letters in the vernacular he writes himself VOLUSENE] (*c.* 1504–*c.* 1547), Scottish humanist, was born near Elgin about 1504. He studied philosophy at Aberdeen, went to Paris, and became tutor to Thomas Wynter, reputed son of Cardinal Wolsey. He paid repeated visits to England, where he was well received by the king, and, after Wolsey's fall, he acted as one of Cromwell's agents in Paris. In Paris he knew George Buchanan, and found patrons in the cardinal Jean de Lorraine and Jean du Bellay. He was to have gone with du Bellay on his mission to Italy in 1535, but illness kept him in Paris. As soon as he recovered he set out on his journey, but stopped at Avignon, where Sadolet made him master in the school at Carpentras. Volusenus paid frequent visits to Lyons, probably also to Italy, where he had many friends, perhaps even to Spain. In 1546 he set out to return to Scotland,

but died at Vienne in Dauphiné in 1546 or early in 1547.

Volusenus was a great admirer of Erasmus, but he criticised the purity of his Latin and also his philosophy. His own philosophy is Christian and Biblical rather than classical or scholastic. He takes a fresh and independent view of Christian ethics, and he ultimately reaches a doctrine as to the witness of the Spirit and the assurance of grace which breaks with the traditional Christianity of his time and is based on ethical motives akin to those of the German reformers.

Volusenus's linguistic studies embraced Hebrew as well as Greek and Latin. His reputation, however, rests on the beautiful dialogue, *De Animi Tranquillitate*, first printed by S. Gryphius at Lyons in 1543. The dialogue shows us Christian humanism at its best, and it is as a Christian philosopher that he attains distinction.

Later editions of the dialogue appeared at Edinburgh in 1707 and 1751 (the latter edited by G. Wishart). All the reissues contain a short life of the author by Thomas Wilson.

VOLUTE, in architecture, a spiral scroll, especially that at each end of an Ionic capital and those under the corners of the abacus of the Corinthian or Composite capital. (*See* ORDER.)

VOLVOX, a well-known genus of organisms claimed by zoologists to belong to the Protozoa (*q.v.*), but perhaps more justifiably placed by botanists in the Chlorophyceae, a section of the Algae (*q.v.*). *Volvox* consists of spherical colonies of cells, all in protoplasmic connection with their neighbours and each bearing a pair of cilia. These beat in regular co-ordination, imparting a rolling motion to the colony. New colonies are formed from special cells set apart for this purpose and grow within the central cavity of the mother-colony. Sexual reproduction also occurs. (*See* ALGAE; PROTOZOA.)

VONDEL, JOOST VAN DEN (1587–1679), Dutch poet, was born at Cologne on Nov. 17, 1587. His father, a hatter, was an exile from Antwerp on account of his Anabaptist opinions; but he returned to Holland when Joost was about ten years old, and settled in Amsterdam, where he carried on a hosiery business. Joost was early introduced to the chamber of the Eglantine, and devoted most of his time to poetry and study. When the elder Vondel died he married Maria de Wolff, and seems to have left the management of his affairs in her capable hands. He read the French contemporary poets, and was especially influenced by the *Divine Sepmaine* of Du Bartas; he made some translations from the German; he was soon introduced to the circle gathered in the house of Roemer Visscher, and with these friends began to make a close study of classical writers. His first play, *Het Pascha* (1612) marked the beginning of a long and brilliant literary career. (*See* DUTCH LITERATURE.) After the production of his political drama of *Palamedes, or Murdered Innocence* (1625), which expressed his indignation at the judicial murder of Oldenbarneveldt in 1619, Vondel went into hiding for a time. In the following years he issued a number of stinging satires against the extreme Calvinists, and he entered into close relationship with Hugo Grotius. Vondel had long been attracted by the aesthetic side of the Roman Catholic Church, and this inclination was perhaps strengthened by his friendship with Marie Tesselschade Visscher, for the Visscher household had been Catholic and liberal. Tesselschade's husband died in 1634; Vondel's wife died in 1635; and the ties between the two were strengthened by time. Vondel eventually showed his revolt against the Calvinist tyranny by formally embracing the Roman Catholic faith in 1640. The step was ill-received by many of his friends, and Hooft forbade him the hospitality of his castle at Muiden. In 1657 his only surviving son, who was entrusted with the hosiery business, mismanaged affairs to such an extent that he had to take ship for the East Indies, leaving his father to face the creditors. Vondel had to sacrifice the whole of his small fortune, and became a government clerk. He was pensioned after ten years' service, and died on Feb 5, 1679.

The more important of his thirty-two dramas are: *Hierusalem Verwoest* ("Jerusalem laid desolate") (1620); *Palamedes, of Vermoorde onnooselheyd* ("Palamedes, or Murdered Innocence") (1625); *Gijsbreght van Aemstel* (1637); *De Gebroeders* (1640), the subject of which is the ruin of the sons of Saul; *Joseph in Egypten* (1640), *Maria Stuart, of gemartelde majesteit* (1646); the pastoral of *De Leeuwendalers* (1648); *Lucifer* (1654); *Salmoneus* (Solomon) (1657); *Jephtha* (1659); *Koning David in ballingschap* ("King David in banishment"), *Koning David hersteld* ("King David restored") and *Samson* (1660); *Batavische Gebroeders*, the subject of which is the story of Claudius Civilis (1663); *Adam in ballingschap* ("Adam in exile") (1664), after the Latin tragedy of Hugo Grotius. He also wrote translations from the tragedies of Seneca, Euripides and Sophocles; didactic poems, and much lyrical poetry beside what is to be found in the choruses of his dramas.

His complete works were edited by van Lennep (12 vols., 1850–69). A bibliography (1888) was published by J. H. W. Unger, who revised van Lennep's edition in 1888–94. *Lucifer* was translated into English verse by L. C. van Noppen (New York, 1898). *See* also E. Gosse, *Studies in Northern Literature* (1879); G. Edmundson, *Milton and Vondel* (1885), where Milton's supposed indebtedness to Vondel is discussed; and critical studies by A. Baumgartner, S. J. (Freiburg, 1882); C. Looten (Lille, 1889), by J. A. Alberdingk Thijm (*Portretten van Joost van den Vondel*, 1876); the chapters on Vondel (pp. 133–325) in W. J. A. Jonckbloet's *Geschiedenis der nederlandsche letterkunde* (vol. iv. 1890); A. J. M. H. Schillings, *Vondel en de regeerders van Amsterdam* (Amsterdam, 1917); J. F. M. Sterck, *Oorkonden over Vondel en zijn kring* (Bussum, 1918); A. J. Barnouw, *Vondel* (N.Y., 1925).

VONDRAK, VACLAV (1859–1925), Czech philologist, was educated at the University of Vienna, where he studied first romance philology and afterwards Slavonic languages. In 1893 he became lecturer on Slavonic languages and literature at the University of Vienna. He wrote works on Church Slavonic and its literature. Later he devoted himself largely to the study of comparative Slavonic philology. His chief works are: *Altslovenische Studien* (Vienna, 1890); *Omluvě Jana Exarcha Bulharského* (Prague, 1896); *Studie Zoborn Církevněslovanského písemnictvi* (Prague, 1903); *Vergleichende Slavische Grammatik* (Göttingen, 1906–08).

VON HOLST, HERMANN EDUARD (1841–1904), German-American historian, was born at Fellin in the province of Livonia, on June 19, 1841. He was educated at the universities of Dorpat and Heidelberg, receiving his doctor's degree from the latter in 1865. He emigrated to America in 1867, remaining there until 1872. He was professor of history in the newly reorganized university of Strasbourg from 1872 to 1874, and at Freiburg in Baden from 1874 to 1892, and for ten years he was a member of the Baden *Herrenhaus*, and vice-president for four. He revisited the United States in 1878–79 and in 1884, and in 1892 he became head of the department of history at the university of Chicago. Retiring on account of ill-health in 1900, he returned to Germany and died at Freiburg on the 20th of January 1904. Both through his books and through his lectures at the university of Chicago, Von Holst exerted a powerful influence in encouraging American students to follow more closely the German methods of historical research. His principal work is his *Constitutional and Political History of the United States* (German ed., 5 vols., 1873–91; English trans. by Lalor and Mason, 8 vols., 1877–92), which covers the period from 1783 to 1861, though more than half of it is devoted to the decade 1850–60; it is written from a strongly anti-slavery point of view. Among his other writings are *The Constitutional Law of the United States of America* (German ed., 1885; English trans., 1887); *John C. Calhoun* (1882), in the American Statesmen Series; *John Brown* (1888), and *The French Revolution Tested by Mirabeau's Career* (1894).

See the *Political Science Quarterly*, v. 677–678; the *Nation*, lxxviii. 65–67.

VONNOH, ROBERT WILLIAM (1858–), American portrait and landscape painter, was born in Hartford (Conn.), Sept. 17, 1858. He was a pupil of Boulanger and Lefebvre in Paris; became an instructor at the Cowles Art School, Boston (1884–85), at the Boston Museum of Fine Art Schools (1885–87), and in the schools of the Pennsylvania Academy of the Fine Arts, Philadelphia (1891–96), and a member of the National Academy of Design, New York (1906).

He has received the Procter portrait prize of the National Academy of Design. He is represented in the Pennsylvania Academy of Fine Arts, in the Massachusetts Historical Society and in the Metropolitan Museum of Art, New York city. His wife,

Bessie Potter Vonnoh (b. 1872), a sculptor, was a pupil of the Art Institute, Chicago, and became a member of the National Sculpture Society. She is represented in the Metropolitan Museum of Art, New York city, in the Corcoran Art Gallery, Washington (D.C.), and in the Brooklyn Museum.

VONONES (on coins ONONES), the name of two Parthian kings. (1) VONONES I., eldest son of Phraates IV. After the assassination of Orodes II. (*c.* A.D. 7), the Parthians applied to Augustus for a new king from the house of Arsaces. Augustus sent them Vonones (*Mon. Anc.* 5, 9; Tac. *Ann.* ii. 1 f.; Joseph. *Ant.* xviii. 2, 4), who was living as a hostage in Rome. But Vonones could not maintain himself; he had been educated as a Roman, and was despised as a slave of the Romans. Another member of the Arsacid house, Artabanus II., who was living among the Dahan nomads, was invited to the throne, and defeated and expelled Vonones. The coins of Vonones (who always uses his proper name) date from A.D. 8–12, those of Artabanus II. begin in A.D. 10. Vonones fled into Armenia and became king there. But Artabanus demanded his deposition, and as Augustus did not wish to begin a war with the Parthians he removed Vonones into Syria, where he was kept in custody (Tac. *Ann.* ii. 4). When he tried to escape, A.D. 19, he was killed by his guards (Tac. *Ann.* ii. 58, 68).

(2) VONONES II., governor of Media, was raised to the throne after the death of Gotarzes in A.D. 51 (perhaps he was his brother, *cf.* Joseph. *Ant.* xx. 3, 4). But he died after a few months, and was succeeded by his son Vologaeses I. (Tac. *Ann.* xii. 14).

(ED. M.)

VOODOO or **VAUDOUX** (Creole Fr. *vaudoux*, a negro sorcerer, probably originally a dialectic form of Fr. *Vaudois*, a Waldensian), the name given to certain magical practices, superstitions and secret rites prevalent among the negroes of the West Indies, notably in the republic of Haiti. Serpent-worship and obscene rites involving the use of human blood, preferably that of a white child, were considered features of this religion.

VOORHEES, DANIEL WOLSEY (1827–1897), American lawyer and political leader, was born in Butler county, O., on Sept. 26, 1827, of Dutch and Irish descent. During his infancy his parents removed to Fountain county, Ind., near Veedersburg. He graduated at Indiana Asbury (now De Pauw) university, Greencastle, Ind., in 1849; was admitted to the bar in 1850, and began to practise in Covington, whence in 1857 he removed to Terre Haute. In 1861–66 and in 1869–73 he was a Democratic representative in Congress; and in 1877–97 he was a member of the U.S. Senate. During the Civil War he seems to have been affiliated with the Knights of the Golden Circle, but he was not so radical as Vallandigham and others. He was a member of the committee on finance throughout his service in the Senate, and his first speech in that body was a defence of the free coinage of silver and a plea for the preservation of the full legal tender value of green back currency, though in 1893 he voted to repeal the silver purchase clause of the Sherman Act. He had an active part in bringing about the building of the Congressional Library. He was widely known as an effective lawyer, especially in jury trials. In allusion to his unusual stature he was called "the Tall Sycamore of the Wabash." He died in Washington, D.C., on April 10, 1897.

VORARLBERG, the most westerly province of Austria, covers an area of 1,005 sq.m. and stretches from the Arlberg pass to the Rhine and Lake Constance. The southern boundary is formed by the limestone range of the Rhätikon Alps (Scesaplana, 9,741 ft.) and part of the crystalline Silvretta massif (Piz Buin, 10,880 ft.). The zones of which these are part stretch across the province from south-west to north-east. North of the Kloster valley the dolomitic limestone builds the western end of the Lechtal Alps, rising above 8,850 ft., which merge, beyond the Walser valley, into the heights of the Bregenzer Wald. The southern slopes of these are of dolomite and more than 6,500 ft. in height but northward the limestone is replaced by the softer sandstones, marls and conglomerates of the *flysch* zone with a general softening of the landscape. In this region, near Bregenz, lignite occurs, but elsewhere power is obtained from the mountain streams, rich in falls, and fed by plentiful annual precipitation (80 in.). The climate in the Rhine valley, sheltered and mild, influenced by *föhn* winds, suits vine and fruit cultivation and its influence stretches far up the fertile tributary valley of the Ill.

Of the total area 88% is productive land but of this 30% is occupied by forests and only 3½% is cultivated ground, the remainder being natural or artificial pasture. Cattle-rearing and the production of milk are therefore important and in this respect Swiss influence is more evident than elsewhere in Austria. So, too, the industrial development of Vorarlberg reflects Swiss contacts, for the manufacture of textiles, particularly cotton goods, has grown with the advantage of cheap power in Bludenz, Dornbirn and Feldkirch. The working of embroidery for the warehouses of St. Gallen is a flourishing home industry.

The population—139,999 (1923), German in speech, Catholic in faith—shows a tendency to concentration in small towns along the valleys of the Rhine and the Ill, the principal lines of rail traffic, but no town is large, only two exceeding 10,000 inhabitants, viz., Dornbirn, the chief industrial centre, and Bregenz, the provincial capital.

The name of the district means the "land that is beyond the Arlberg Pass," that is, as it seems to one looking at it from the Tirol. This name is modern and is a collective appellation for the various counties or lordships in the region which the Habsburgs (after they secured Tirol in 1363) succeeded in purchasing or acquiring—Feldkirch (1375, but Hohenems in 1765 only), Bludenz with the Montafon valley (1394), Bregenz (in two parts, 1451 and 1523) and Sonnenberg (1455). After the annexation of Hohenems (its lords having become extinct in 1759), Maria Theresa united all these lordships into an administrative district of Hither Austria, under the name Vorarlberg, the governor residing at Bregenz. In 1782 Joseph II. transferred the region to the province of Tirol. The lordship of Blumenegg was added in 1804, but in 1805 all these lands were handed over, by virtue of the peace of Pressburg, to Bavaria, which in 1814 gave them all back, save Hoheneck. In 1815 the present administrative arrangements were made. The building of the Arlberg railway (1880–1884), however, effected a considerable strengthening of the economic and political interests of Vorarlberg with the remainder of Austria.

See also under *Austria and Tirol*, relevant sections in C. Brockhausen, *Österreich in Wort und Bild.* (Berlin, 1924), and J. C. Heer, *Vorarlberg und Liechtenstein—Land und Leute* (Feldkirch, 1906).

VORONEZH, a province of the Russian S.F.S.R., having the Ukrainian S.S.R. and the North Caucasian area on the south, Kursk and Orel on the west, Tambov on the north and Stalingrad on the east. Area 65,306 sq. kilometres. Pop. (1926) 3,299,700. It is now included in the recently created Black Earth Area (Central) (*q.v.*). It does not coincide with the pre-1917 province of the same name.

Voronezh occupies the southern slopes of the Central Russian plateau (450–700 ft.), and its surface is hilly and intersected by deep ravines in the west, where two ranges of chalk hills separated by a broad valley run north and south. East of the Don river is a low plain. Glacial clays with erratic boulders, and lacustrine clays and sands cover much of the area, but the Devonian rocks crop out in the north and provide good paving and building stone, while the carboniferous rocks supply millstones and grindstones. There is an abundant supply of chalk and kaolin clay for pottery.

The magnetic anomaly existing in Kursk extends into the south-west of Voronezh and indicates the presence of deep-seated iron ore beds. The soils are mainly black earth formed on loess; they vary in character from the rich black earth with a high humus content of the southern "feather grass" steppe, through the meadow steppe of the centre to the "lyesso steppe" of the north. This latter is black earth on which forest spread with moister conditions; the forest has now disappeared, through reckless cutting, and the black earth here is reduced in humus quantity to 4 to 6%. The forest cutting has had a disastrous effect in the west and centre for the spring streams, swollen by melting snow, frequently wash away fields and roads. In the last 25 years 135,000 ac. of fertile black earth have been washed away and replaced

by river sand. Efforts are being made to cope with this by prohibition of forest cutting in the upper courses of the rivers, and of cattle driving on ravine slopes; by ploughing across the slopes and not down them, and by the construction of canals and ditches. The problem is less acute in the east.

The climate is of the continental type, average January temperature at Voronezh 8·3° F, average July 74·2° F. The rainfall is variable and not very favourable to agriculture. If the spring rains (especially in May) fail, as they often do, famine frequently ensues. June and July are months of thunder-storm and very heavy rainfall, which comes in fierce and often destructive storms. The snow covering also varies; if it is deep, there is a chance of a good harvest, *e.g.*, in 1906–07 it remained 3 ft. deep most of the winter. In some years there is very little snow and the harvest is then poor. Autumn is very brief, but winter often lasts 5½ months, though a duration of two months only has been recorded. The rivers are frozen as a rule from Nov. 20 in the north and from Dec. 10, in the south-west. Snow melts as a rule in April. Winter is dull and cloudy, often with heavy fog. Another cause of disaster is the dry, cold, south-east winds which often blow in May and cause great damage to young crops.

These varied risks of disaster due to climate hamper agriculture seriously and famines have been frequent (1891, 1911, 1921) and severe. Weeds lessen the harvest, and their seeds are frequently not removed from the grain harvest, while rodents, mice, rats, hamsters, susliks and marmots in the south and south-east do great damage. A further drawback is the entirely inadequate system of communications; roads are often impassable through mud or deep in dust, and railways are insufficient, so that in years of abundance there is no outlet for the surplus, and in years of famine it is impossible to help the population. The 1891 famine resulted in some improvements of railway conditions.

The three-field system, probably introduced in the 16th century, gradually ousted the previous system of sowing till the land was exhausted, and then letting it lie fallow, sometimes for 20 or 30 years, till it recovered its fertility, and the hunting, fishing and bee-keeping, formerly wide-spread, has almost disappeared. By the end of the 19th century, a few agricultural specialists had begun to agitate against the wasteful three-field system and about 3% of the land in 1900 was worked on a many-field system, *e.g.*, a fallow year, under manure, rye, oats with clover, two years grass and clover, a clover fallow without manure, rye, potatoes or sugar-beet, oats or sunflower seed. A complicated system such as this, however, demands forethought and a fairly high stage of culture from the farmer, and the peasants in the Black Earth region are illiterate. The region is poverty-stricken and in many villages the peasants live in one-roomed huts infested by lice, fleas, blackbeetles and other vermin. Diet is poor, mainly starchy foods; eggs and butter are reserved for sale and meat is unobtainable in the general poverty-stricken conditions. Sanitation is absent and there is frequently no town or village provision for cleaning or repairing the streets, or for supplying water, or medical and veterinary help. This deplorable social condition is partly due to the difficulties outlined above, but mainly to historic factors. The long subjection of the peasants, first to Tatar oppression and later to serfdom under Russian landlords ended only in 1861, and the so-called "liberation" of the serfs in that year was followed by an almost as oppressive debt slavery. Between 1896 and 1914 thousands of peasants emigrated to Siberia and the south, while others wandered seasonally in search of supplementary occupation. From 1914 onwards, mobilization of the most useful agricultural labour was recklessly enforced and from 1918 to 1920 the region was occupied first by German troops and then by the conflicting armies of the Civil War. Upon this supervened the famine of 1921. Large sums of money were voted by the All Russian Executive at Moscow in 1925–26 for the supply of horses, seeds, agricultural implements and agronomic and veterinary help to the region, but it must be many years before conditions are markedly improved.

Of the crops in 1926, rye occupied the first place, followed by hemp, wheat, millet, sunflower seed, potatoes and oats. Sugar-beet, melons and pumpkins and aniseed are also grown. Stock-raising, especially of horses, is carried on in the south-east and with it goes a leather industry. Poultry keeping has an export character, and there is still a little bee-keeping. The Voronezh Agricultural institute was opened in 1913. The University of Voronezh was founded in 1915, when the Germans occupied Yuriev (now in Poland) and its university was therefore transferred to Voronezh.

Forests, which in the time of Peter the Great supplied timber for ship-building, are now practically all destroyed, especially the oak forests. The Voronezh river carries the pine forest and marsh of the north southwards into the region along its sandy, low left bank, as does the Bityuga. The hedgehog, badger, squirrel, polecat, marsh-otter, otter, weasel, ermine, wolf and fox still exist in a few places and marmot fur is worked near Bobrov. The musk-rat is found near the Bityuga and the Khoper rivers. But hunting, which even in the early 19th century had some importance and which in the 18th century included the hunting of the wild horse, is rapidly dying out. Factory industries mainly depend on local products and include mainly flour-milling, oil-pressing, distilling, the manufacture of makhorka tobacco, brick-making, leather and rope works.

The population is mainly Great Russian, with a considerable amount of Tatar intermixture. The region has been inhabited from remote times and the east is thickly strewn with kurgans, or mounds; some contain burial relics, and some are the remains of earlier fortifications. The chief towns are Voronezh and Buturlinovka (*q.v.*). No other town reaches a population of 10,000.

Voronezh, the chief town of the above province and the administrative centre of the Black Earth Area (Central), situated on the navigable Voronezh river, 5 m. above its confluence with the Don, in 51° 42′ N., 39° 10′ E. Pop. (1926) 98,573. It has a grain elevator and three railways branching from it and is an important collecting centre for the surrounding agricultural region. Its industrial enterprises include machine-making factories, steam flour-mills, oil-pressing mills and the manufacture of bricks, wadding, paint and alcoholic drinks. A university and agricultural institute and museums exist.

The site was occupied in the 11th century by a Khazar town, deserted during the 14th and 15th centuries. The Russians built a fort here in 1586, which was burned by the Tatars in 1590, but rebuilt. Peter the Great in 1695 built here a flotilla of boats for the conquest of Azov. The town was destroyed by fire in 1703, 1748 and 1773, but was always rebuilt.

VORONOFF, SERGE (1866–), Russian surgeon and physiologist, born on July 10, 1866, was educated in Paris, where he studied medicine and became chief surgeon in the Russian hospital. In 1917 he became chief surgeon of the Military hospital in Paris, and after the World War became director of the biological laboratory of the École des Hautes Études. His latest appointment was to the directorship of experimental surgery of the Station Physiologique du Collège de France. He has become widely known for his extended application of the theory of Brown-Sequard. Brown-Sequard applied his discovery that gland secretions are the same in animals as in man to practical purpose, by using animal secretions to supplement deficiencies in human beings. Voronoff extended the principle to the grafting of healthy animal glands on the human body. He is also developing by experiment a theory of the relation of gland secretions to senility. He carried out a series of experiments on the improvement of live-stock.

His works include treatises on *Surgery; Gynaecology; Bone Grafting; Articulation Grafting; Ovarian Grafting; Thyroid Grafting; Skin Grafting; Grafting of Interstitial Glands; Life, The Study of Old Age and My Method of Rejuvenation.*

VORONTSOV or WORONZOFF, the name of a Russian family various members of which are distinguished in Russian history.

MIKHAIL ILLARIONOVICH VORONTSOV (1714–1767), Russian imperial chancellor, assisted Elizabeth Petrovna during the *coup d'état* of Dec. 6, 1741, when she seized the Russian throne. In 1742 he married Anna Skavronskaya, the empress's cousin; and in 1744 was created a count and vice-chancellor. His jealousy of Alexis Bestuzhev induced him to participate in Lestocq's conspiracy against that statesman, and he lived in retirement during the

domination of Bestuzhev (1744–1758). On the disgrace of Bestuzhev, Vorontsov was made imperial chancellor. Vorontsov followed blindly the policy of the court. Yet he did not lack personal courage, and endured torture after the Revolution of July 9, 1762, rather than betray Peter III. At first he refused to serve under Catherine II., though she reinstated him in the dignity of chancellor. When he found that the real control of foreign affairs was in the hands of Nikita Panin, he resigned his office (1763). Vorontsov was a generous protector of the nascent Russian literature, and, to judge from his letters, was a highly cultivated man.

ALEXANDER ROMANOVICH VORONTSOV (1741–1805), Russian imperial chancellor, nephew of the preceding and son of Count Roman Vorontsov, represented Peter III. for a short time at the court of St. James. Catherine II. made him a senator and president of the department of Trade; but she never liked him, and ultimately (1791) compelled him to retire from public life. In 1802 Alexander I. summoned him back to office and appointed him imperial chancellor. The Vorontsovs had always insisted on the necessity of a close union with Austria and Great Britain, in opposition to Panin and his followers, who had leaned on France or Prussia till the outbreak of the Revolution made friendship with France impossible. Vorontsov was also an implacable opponent of Napoleon. The rupture with Napoleon in 1803 is mainly attributable to him. He retired in 1804.

His "Memoirs of my Own Times" (Rus.) is printed in vol. vii. of the *Vorontsov Archives*.

SEMEN ROMANOVICH VORONTSOV (1744–1832), Russian diplomatist, brother of Alexander Romanovich, distinguished himself during the first Turkish War of Catherine II. at Larga and Kagula in 1770. In 1783 he was appointed Russian minister at Vienna, but in 1785 was transferred to London where he lived for the rest of his life. During Catherine's second Turkish War he contributed to bring about the disarmament of the auxiliary British fleet which had been fitted out to assist the Turks, and in 1793 obtained a renewal of the commercial treaty between Great Britain and Russia. Subsequently, his extreme advocacy of the exiled Bourbons, his sharp criticism of the Armed Neutrality of the North, which he considered disadvantageous to Russia, his denunciation of the partitions of Poland as contrary to the first principles of equity and a shock to the conscience of western Europe, profoundly irritated the empress. On the accession of Paul he was raised to the rank of ambassador extraordinary and minister plenipotentiary, and received immense estates in Finland. Neither Vorontsov's detention of the Russian squadron under Makarov in British ports nor his refusal, after the death of Bezborodko, to accept the dignity of imperial chancellor could alienate the favour of Paul. It was only when the emperor himself began to draw nearer to France that he began to consider Vorontsov as incompetent to serve Russia in England, and in February 1800 all the count's estates were confiscated. Alexander I. on his accession at once reinstated him, but ill-health and family affairs induced him to resign his post in 1806. From that time till his death in 1832 he continued to live in London.

MIKHAIL SEMENOVICH VORONTSOV (1782–1856) Russian prince and field-marshal, son of the preceding, spent his childhood and youth with his father in London. During 1803–04 he served in the Caucasus under Tsitsianov and Gulyakov, and was nearly killed in the Zakatahko disaster (January 15, 1804). He served in the campaigns of 1805–07 against Napoleon, against the Turks in 1809–11, and with Bagration's army in 1812. In 1814, at Craonne, he brilliantly withstood Napoleon in person. He was the commander of the corps of occupation in France from 1815 to 1818. In 1823 he was appointed governor-general of New Russia, as the southern provinces of the empire were then called; he may be said to have been the creator of Odessa and the benefactor of the Crimea. He was the first to start steamboats on the Black Sea (1828). The same year he succeeded the wounded Menshikov as commander of the forces besieging Varna, which he captured on Sept. 28. In the campaign of 1829 he took measures to prevent the spread of the plague from Turkey to Russia. In 1844 Vorontsov was appointed commander-in-chief and governor of the Caucasus with plenipotentiary powers. For his brilliant campaign against Shamyl, and especially for his difficult march through the dangerous forests of Ichkerinia, he was raised to the dignity of prince. By 1848 he had captured two-thirds of Daghestan, and the situation of the Russians in the Caucasus, so long almost desperate, was steadily improving. In the beginning of 1853 Vorontsov retired. He was made a field-marshal in 1856, and died the same year at Odessa.

See V. V. Ogarkov, *The Vorontsovs* (Rus.) (St. Petersburg, 1892); *Vorontsov Archives* (Rus. and Fr.) (Moscow, 1870, etc.); M. P. Shelverbinin, *Biography of Prince M. S. Vorontsov* (Rus.) (St. Petersburg, 1858).

VOROSHILOV, KLEMENTIY EFREMOVICH (1881–), Russian soldier and politician, was the son of a workman. At the age of seven he began to work in the mines and only learned to read when he was 12 years old. He became a revolutionary in 1897; in 1903 he joined the Bolshevik party, and in 1906 was a delegate to the Stockholm congress of the Bolsheviks. In the following year he was sentenced to banishment for organising strikes and similar activities, and he remained in banishment, except for escapes and rearrests, until 1914. His military career began in the Ukraine, where he organised a detachment of partisans and carried on guerrilla warfare against the German forces of occupation. Shortly afterwards he was commanding a small army and when it fought its way out, this army became the nucleus of the X. Red Army, the command of which was entrusted to Voroshilov. When the Germans left the Ukraine, Voroshilov became a member of the Ukrainian Soviet government. He was later associated with Budenny as a member of the revolutionary military council of the I. Cavalry Army.

In March 1921, Voroshilov took an active part in the suppression of the revolt at Leningrad. He was elected a member of the central committee of the Communist party, and in May 1921 was appointed to command the Northern Caucasian military district. In 1924 he was appointed commander of the troops in the Moscow district, and a member of the revolutionary military council of the Union. After the death of Frunze in 1925, he became president of the revolutionary military council and commissar for military and naval affairs.

VÖRÖSMARTY, MIHÁLY (1800–1855), Hungarian poet, was born at Puszta-Nyék on Dec. 1, 1800, of a noble Roman Catholic family. His father was a steward of the Nadasdys. Mihály was educated at Székesfejérvár by the Cistercians and at Pest by the Piarists. The death of the elder Vörösmarty in 1811 left his widow and numerous family extremely poor. As tutor to the Perczel family, however, Vörösmarty paid his own way through his academical course at Pest. He had already begun a drama entitled *Salamon* when he flung himself recklessly into public life since he was consumed by a hopeless passion for Etelka Perczel, who socially was far above him. To his unrequited love we owe a whole host of exquisite lyrics, while his patriotism found expression in the heroic epos *Zalán futása* (1824), gorgeous in colouring, exquisite in style, one of the gems of Magyar literature. This new epic marked a transition from the classical to the romantic school. Henceforth Vörösmarty was hailed by Kisfaludy and the Hungarian romanticists as one of themselves. Between 1823 and 1831 he composed four dramas and eight smaller epics, partly historical, partly fanciful. Of these epics he always regarded *Cserhalom* (1825) as the best, but modern criticism has given the preference to *Két szomséd vár* (1831), a terrible story of hatred and revenge. When the Hungarian Academy was finally established (Nov. 17, 1830) he was elected a member of the philological section, and ultimately succeeded Károly Kisfaludy as director with an annual pension of 500 florins. He was one of the founders of the Kisfaludy Society, and in 1837 started the *Athenaeum* and the *Figyelmezö*, the first the chief bellettristic, the second the best critical periodical of Hungary. From 1830 to 1843 he devoted himself mainly to the drama, the best of his plays, perhaps, being *Vérnász* (1833). He also published several volumes of poetry, containing some of his best work. *Szózat* (1836), which became a national hymn, *Az elhagyott anya* (1837) and *Az úri hölgyhöz* (1841) are all inspired by a burning patriotism. He represented Jankovics at the diet of

1848, and in 1849 was made one of the judges of the high court. The national catastrophe profoundly affected him. For a short time he was an exile, and when he returned to Hungary in 1850 he was already an old man. A profound melancholy crippled him for the rest of his life. In 1854 he wrote his last great poem, the touching *A vén cigány*. He died at Pest in 1855 in the same house where Karóly Kisfaludy had died twenty-five years before. His funeral, on Nov. 21, was a day of national mourning.

The best edition of Vörösmarty's collected works is by Pál Gyulai (Budapest, 1884). Some of them have been translated into German, e.g., *Gedichte* (Pest, 1857); *Ban Marot*, by Mihály Ring (Pest, 1879); *Ausgewählte Dichte*, by Paul Hoffmann (Leipzig, 1895). *See* Pál Gyulai, *The Life of Vörösmarty* (Hung.) (3rd ed., Budapest, 1890), one of the noblest biographies in the language; Brajjer, *Vörösmarty, sein Leben und seine Werke* (Nagy-Becskerek, 1882). (R. N. B.)

VORTICELLA, the bell-animalcule, a Protozoan genus of the large family *Vorticellidae* belonging to the Peritrichous Infusoria (*q.v.*) characterized by the bell-shaped body, with short oral disc and collar, attached by a hollow stalk, inside and around which passes, attached spirally, a contractile bundle of myonemes. By their contraction the stalk is brought into the form of a corkscrew, and the animal is jerked back near to the base of the stalk. As soon as the contraction of the thread ceases, the elasticity of the stalk extends the animal to its previous position. On fission, one of the two animals swims off by the development of the temporary posterior girdle of membranelles, the disc being retracted and closed over by the collar, so that the cell is ovoid; on its attachment the posterior girdle of cilia disappears and a stalk forms. The other cell remains attached to the old stalk. In the allied genera *Carchesium* and *Zoothamnium* the two produced by fission remain united, so that a branching colony is ultimately produced. The genus is a large one. The gametes in conjugation differ from one another, one being attached, the other free. Each pair fuses together completely and permanently.

VORTIGERN (GUORTHIGIRNUS, WYRTGEORN), king of the Britons at the time of the arrival of the Saxons under Hengest and Horsa in the 5th century Though many legends have come down to us, about him, he may probably be safely regarded as an actual historical figure. Vortigern made use of Hengest and Horsa to protect his kingdom against the Picts and Scots, and rewarded them for their services with a grant of land. Later we find the Britons at war with the new-comers, now established in Kent, and four battles are fought, in the last of which, according to the *Historia Brittonum*, the king's son Vortemir, their leading opponent, is slain. The *Historia Brittonum* is our only authority for the marriage of Vortigern with the daughter of Hengest before the war. It also records the massacre of the British nobles after the death of Vortemir and the subsequent grant of Essex and Sussex to the invaders by Vortigern.

See *Historia Brittonum*, ed. Th. Mommsen in *Mon. Hist. Germ.* xiii.; *Anglo-Saxon Chronicle*, ed. Earle and Plummer (Oxford, 1899); Bede, *Hist. Eccl.*, ed. C. Plummer (Oxford, 1896).

VOSGES, an upland department of eastern France, formed in 1790 chiefly of territory previously belonging to Lorraine, together with portions of Franche-Comté and Champagne, and bounded north by Meurthe-et-Moselle, north-east by Bas-Rhin, east by Haut-Rhin, south-east by the territory of Belfort, south by Haute-Saône, west by Haute-Marne and north-west by Meuse. Pop. (1926), 382,100; area, 2,303 sq.m. The Vosges mountains form a natural boundary on the east, their highest French eminence, the Hohneck, attaining 4,482 ft. The Monts Faucilles traverse the south of the department in a broad curve declining on the north into elevated plateaux, on the south encircling the upper basin of the Saône. This chain, dividing the basins of the Rhone and the Rhine, forms part of the European watershed between the basins of the Mediterranean and Atlantic. The Moselle and the Meuse, tributaries of the Rhine, have the largest drainage areas in the department; a small district in the north-west sends its waters to the Seine, the rest belongs to the basin of the Rhone. The Moselle rises in the Col de Bussang in the extreme south-east, and in a north-north-westerly course of about 70 m. in the department receives the Moselotte and the Vologne on the right; the Mortagne and Meurthe on the right and the Madon on the left bank also belong to this department though they join the Moselle outside its borders.

The elevation and the northward exposure of the valleys make the climate severe, and a constant dampness prevails, owing both to the abundance of the rainfall and to the impermeability of the subsoil. The winter average temperature reduced to sea-level is 34° to 35°, the summer average temperature being 66° to 68°. The rainfall varies from 28 in. to 60 in., according to the altitude. Arable farming flourishes in the western districts where wheat, oats, beetroot, tobacco, hops, potatoes and hemp are largely grown. The vine is cultivated on the river banks, to best advantage on those of the Moselle. Pasture is abundant in the mountainous region, where cheese-making is carried on to some extent, but the best grazing is in the central valleys. Forests, which occupy large tracts on the flanks of the Vosges, cover about one-third of the department, and are a principal source of its wealth. Sawmills are numerous in the Vosges and the manufactures of furniture, sabots, brushes and wood-working in general are prominent industries. The department has mines of lignite and stone quarries of various kinds. There are numerous mineral springs, notably those of Contrexéville, Plombières, Vittel, Bains-les-Bains, Martigny-les-Bains and Bussang. Metal goods are made, but the manufacture of textiles is the chief industry, comprising the spinning and weaving of cotton, wool, silk, hemp and flax, and the manufacture of hosiery and of embroidery and lace, Mirecourt (pop. 5,161), which also makes musical instruments, being an important centre for the two last. The department forms the diocese of St. Dié (province of Besançon), has its court of appeal and educational centre at Nancy, and belongs to the district of the XX. Army Corps. It is divided into three arrondissements of Épinal, the capital, Neufchâteau and St. Dié, with 29 cantons and 531 communes.

VOSGES, a mountain range stretching along the west side of the Rhine valley, from Basel to Mainz, a distance of 150 m. They are similar to and closely associated with the Black Forest. The ranges are similar in geological formation and are portions of the same structural unit, for the Rhine valley which separates them lies in a rift valley of Tertiary age. In addition both have fine forests on their lower slopes, above which are open pasturages and rounded summits of a uniform altitude; both have a steep fall to the Rhine and a gradual descent on the other side. The Vosges in their southern portion are mainly of granite, with some porphyritic rocks, and a red sandstone (occasionally 1,640 ft. thick) which on the western versant is named "grès Vosgien."

Orographically the range is divided into four sections: the Grandes Vosges (62 m.), extending from Belfort to the Col de Saales; the Central Vosges (31 m.), between the latter and the Col de Saverne; the Lower Vosges (30 m.) from thence to the source of the Lauter; and the Hardt Mts. (*q.v.*). The rounded summits of the Grandes Vosges are called "ballons." The departments of Vosges, Haute Saône, and Haut-Rhin and Belfort territory meet at the Ballon d'Alsace (4,100 ft.). Thence northwards the average height of the range is 3,000 ft., the highest point, the Ballon de Guebwiller (Gebweiler), or Sultz, rising east of the main chain to 4,668 ft. The Col de Saales is nearly 1,900 ft. high. The central section is both lower and narrower than the Grandes Vosges, Mont Donon (3,307 ft.) being the highest summit. The Rhine and Marne Canal and the Paris-Strasbourg railway traverse the Col de Saverne. There are motor roads over the passes of Bussang (Remiremont to Thann), the Schlucht (3,625 ft.) (Gérardmer to Munster), the Bonhomme (St. Dié to Colmar) and the pass from St. Dié to Ste. Marie-aux-Mines. The Lower Vosges are a sandstone plateau ranging from 1,000 to 1,850 ft. high, and are crossed by the railway from Hagenau to Sarreguemines, defended by the fort of Bitche.

The annual rainfall is much higher and the mean temperature much lower in the western than in the eastern versants whilst on the latter the vine ripens to a height of 1,300 ft.; but its only rivers here are the Ill and other shorter streams. The Moselle, Meurthe and Sarr all rise on the Lorraine side. Moraines, boulders and polished rocks testify to the existence of glaciers which formerly covered the Vosges. The lakes, surrounded by pines, beeches

and maples, the green meadows which provide pasture for large herds of cows, and the fine views of the Rhine valley, Black Forest and snow-covered Swiss mountains combine to make the district picturesque.

VOSS, JOHANN HEINRICH (1751–1826), German poet and translator, was born at Sommersdorf in Mecklenburg-Strelitz on Feb. 20, 1751, the son of a farmer. At the invitation of H. C. Boie, whose attention he had attracted by poems contributed to the Göttingen *Musenalmanach*, he went to Göttingen in 1772. Here he studied philology and became one of the leading spirits in the famous *Hain* or *Dichterbund*. In 1775 Boie made over to him the editorship of the *Musenalmanach*, which he continued to issue for several years. He married Boie's sister Ernestine in 1777. Voss was rector of the School at Otterndorf, Hanover (1778–82), and at Eutin (1782–1802). He then became a professor at Heidelberg, where he died on March 28, 1826.

The best of his works is his idyllic poem *Luise* (1795), in which he sought to apply the style and methods of classical poetry to the expression of modern German thought and sentiment. But he is chiefly remembered for his translations of Homer, Hesiod, Theocritus, Bion and Moschus, Virgil, Horace, Tibullus, Propertius, and of Shakespeare's plays (9 vols.).

J. H. Voss's *Sämtliche poetische Werke* were published by his son Abraham in 1835; new ed. 1850. A good selection is in A. Sauer, *Der Göttinger Dichterbund*, vol. i. (Kürschner's *Deutsche National-literatur*, vol. 49, 1887). His Letters were also published by his son in 4 vols. (1829–33). Voss left a short autobiography, *Abriss meines Lebens* (1818). *See* also W. Herbst, *J. H. Voss* (3 vols., 1872–76); A. Heussner, *J. H. Voss als Schulmann in Eutin* (1882).

VOSS, RICHARD (1851–1918), German dramatist and novelist, was born at Neugrape, in Pomerania, on Sept. 2, 1851, the son of a country squire. Though intended for the life of a country gentleman, he showed no inclination for outdoor life, and on his return from the war of 1870–71, in which he was wounded, he studied philosophy at Jena and Munich, and then settled at Berchtesgaden. In 1884 Voss was appointed by the grand duke of Weimar librarian of the Wartburg, but, in consequence of illness, he resigned the post. He died at Königsee, Thuringia, on July 10, 1918.

Chief among his dramas are *Savonarola* (1878); *Magda* (1879); *Die Patricierin* (1880); *Der Mohr des Zaren* (1883); *Unehrlich Volk* (1885); *Alexandra* (1886); *Eva* (1889); *Wehe dem Besiegten* (1889); *Die neue Zeit* (1891); *Schuldig* (1892). Among his novels may be mentioned *San Sebastian* (1883); *Der Sohn der Volskerin* (1885); *Die Sabinerin* (1888); *Der Mönch von Berchtesgaden* (1891); *Der neue Gott* (1898); *Die Rächerin* (1899); *Allerlei Erlebtes* (1902); *Die Leute von Valdaré* (1902); *Die Erlösung* (1921); *Bergasyl* (1922); *Alpentragödie* (1923); also the war book *Brutus, auch Du* (1917). Voss wrote his recollections (*Erinnerungen*) in 1920; *see* also M. Goldmann, *Richard Voss, ein literarisches Charakterbild* (1900).

VOSSEVANGEN or Voss, a village and tourist-centre of Norway, in South Bergenhus *amt* (county), 67 m. N.W. of Bergen by rail. Vossevangen is situated on the Vangsvand, in fertile upland, and has a stone church of the 13th century, and a *finneloft* or two-storeyed timber church of the 14th century.

VOSSIUS (Voss), **GERHARD JOHANN** (1577–1649), German classical scholar and theologian, was the son of Johannes Voss, a Dutch Calvinist pastor, and was born in a village near Heidelberg, where his father had found refuge. But Voss was unwelcome among the Lutherans, and returned with his son to Holland. Gerhard was educated at the university of Leyden, where he became the lifelong friend of Hugo Grotius, and studied classics, Hebrew, church history and theology. He was rector (1600–14) of the high school at Dort, and then director of the theological college at Leyden (1614–19). He came under suspicion of heresy, and escaped expulsion from his office only by resignation (1619). In 1618 he had published his history of Pelagian controversies, which his enemies considered favoured the views of the Arminians or Remonstrants. In 1622, however, he was appointed professor of rhetoric and chronology, and subsequently of Greek, in the university. He declined invitations from Cambridge, but accepted from Archbishop Laud a prebend in Canterbury cathedral without residence, and went to England to be installed in 1629, when he was made LL.D. at Oxford. In 1632 he left Leyden to become professor of history in the newly founded Athenaeum at Amsterdam. There he died on March 19, 1649.

Vossius was amongst the first to treat theological dogmas and the heathen religions from the historical point of view. His principal works are *Historia Pelagiana sive Historiae de controversiis quas Pelagius eiusque reliquiae moverunt* (1618); *Aristarchus, sive de arte grammatica* (1635 and 1695; new ed. in 2 vols., 1833–35); *Etymologicum linguae Latinae* (1662; new ed. in two vols., 1762–63); *Commentariorum Rhetoricorum oratoriarum institutionum Libri VI.* (1606 and often); *De Historicis Graecis Libri III.* (1624); *De Historicis Latinis Libri III.* (1627); *De Theologia Gentili* (1642); *Dissertationes Tres de Tribus Symbolis, Apostolico, Athanasiano et Constantinopolitano* (1642). Collected works published at Amsterdam (6 vols., 1695–1701).

See P. Nicéron, *Mémoires pour servir à l'histoire des hommes illustres*, vol. xiii. (Paris, 1730); Herzog's *Realencyklopädie*, art. "Vossius."

VOTE and **VOTING.** "Vote" is specially employed in the sense of a registering of one's choice in elections or on matters of debate, and the political meaning is the only one which requires comment. In ancient Greece and Italy the institution of suffrage already existed in a rudimentary form at the outset of the historical period. In the primitive monarchies it was customary for the king to invite pronouncements of his folk on matters in which it was prudent to secure its assent beforehand. In these assemblies the people recorded their opinion by a shout (a method which survived in Sparta as late as the fourth century B.C.), or, probably, by the clashing of spears on shields. With the development of democracy the taking of votes was effected in the form of a poll in law courts, councils, general assemblies, etc. The practice of the Athenians, which is shown by inscriptions to have been widely followed in the other states of Greece, was to hold a show of hands (χειροτονία), except on questions affecting the status of individuals: these latter, which included all lawsuits and proposals of ostracism (*q.v.*), were determined by secret ballot (ψήφισμα, so called from the ψῆφοι or pebbles with which the votes were cast). With the increase of the power of the democratic party, the lot was substituted for election, for some of the most important offices. At Rome the method which prevailed up to the second century B.C. was that of division (*discessio*). But the economic and social dependence of many voters on the nobility caused the system of open suffrage to be vitiated by intimidation and corruption. Hence a series of laws enacted between 139 and 107 B.C. prescribed the use of the ballot ("tabella," a slip of wood coated with wax) for all business done in the assemblies of the people. In federal governments the election of deputies to a central legislature seems to be attested by the practice of the Achaean League, where the federal Council was probably elected in the several constituent towns.

See ARCHON, ECCLESIA, BOULE, OSTRACISM, STRATEGUS, MUNICIPIUM, SENATE, and TRIBUNE. For modern practice *see* ELECTORAL SYSTEMS.

VOTING MACHINES. The use of the Australian ballot system has been attended with many complications which have seriously handicapped its use. These have resulted in the development of voting machines for registering and counting votes. Every voter under the Australian system uses a separate paper ballot which causes considerable delay in the counting of votes and the announcement of results. It also permits fraud. Void and blank paper ballots are generally 5% of those voting, and sometimes as high as 40%; lost votes sometimes exceed the majorities of successful candidates; close elections cause endless legal disputes; contested elections follow with recount costs that exceed the original cost at the election, and a successful candidate's rights are sometimes abrogated until the term of office expires. There are many ways of marking ballots for those on election boards in collusion with vote buyers outside. Voting machines remedy many of these ills. On the voting machine one mechanical ballot is used by all voters, each setting the ballot as he wishes. The vote is registered on the machine's counters, which shows votes when cast so that each candidate's total is seen at all times.

The first inventors of voting machines were English. The earlier machines of Vassie, Chamberlain, Sydserff (1869) and Davy (1870) all used a ball or equivalent placed in a chosen compartment for casting a vote. A number of American inventors also made machines using balls. All these early machines were

only makeshifts because the balls had to be counted. Later, mechanical counters replaced balls; a key and a counter was provided for each candidate, the machine was constructed to prevent voters from giving the keys more than one impulse and from using more keys than those to which they are entitled. The first of these machines used were the Myers ballot machine at Lockport in 1892. About 65 were used in Rochester, N.Y., in 1896. It was not reliable or convenient enough but proved it practical for voters to register votes secretly and pointed to the future developments. The McTammany machine had a separate key for each candidate. Holes punched in a paper web were counted by a pneumatical machine. Bardwell, Abbott and Dean machines registered votes on mechanical counters.

The U.S. Standard, the Empire and the Automatic Registering machines followed, the latter being the last perfected product. All three were made by one company or its successors at Jamestown, N.Y., past owners of Keiper's roller interlock patent. This patent, No. 1,031, issued July 2, 1912, expired in 1929, and opened the voting machine business to competition. This interlock is simple, strong, accurate and flexible, and was installed on all these machines. They constitute about 98% of the 16,000 or more machines in the United States. A separate key is provided for each candidate. The keys, in horizontal party rows and vertical office lines, are pivoted, swinging from the horizontal and pointing to the candidates' names printed on ballot labels below the keys. Combined keys, labels, keyboard, etc., makes a mechanical Australian ballot. At the left of each party row are party levers by moving any one of which all pointers on its party row are put in voted position. In States not providing for straight tickets, party levers are omitted or locked. A U-shaped rail holding a curtain forms a booth completely enclosing the voter. By a lever at the top the voter closes the curtain and unlocks the machine. As a single stroke of a party lever puts all the keys into position, the voter can turn up the keys of candidates he wants to omit and vote the others. Reversing the curtain lever counts the votes, resets the keys, opens the curtain, and exposes the keyboard. Until the curtain opens the vote is not counted and the voter can take back or change his vote. Repeating is prevented by a knob locking the curtain lever against a second movement by the same voter until it is released by the election officers.

The counters are inside of the machine and are concealed by a door in the back. After the election is over the machines must be locked against voting before this door can be opened. Then the total vote for each candidate is read off directly from his counter. These counters are easily reset for another election but they can only be unlocked for that purpose by the custodian's key. This custodian's key is not given to the election board, but is held by the officer charged with the duty of preparing the machine for the election. The keys and counters on a machine provide for voting for those candidates that have been regularly nominated and whose names would be printed on the paper ballot if used. It is the voters privilege to vote for candidates not nominated and the machine must provide facilities for voting for them. At the top of the machine is a horizontal paper roll that runs the whole length of the machine, on which can be written the names of these candidates. This roll is concealed by slides, one above each line of office keys. One of these slides must be lifted for each office line to expose the paper. The interlocking mechanism must control all the voting keys on the machine so that the voter cannot vote more than he is entitled to vote.

Machines have been built large enough to provide for nine parties of 70 candidates each and for 35 questions or amendments. A machine of such size carries 700 counters besides the total vote and protective counters. The total vote counter shows the number of voters voting at each election and can be reset for each election. Another counter shows the total number of votes cast during the life of the machine. It is made so that it cannot be reset and acts as a seal on the machine. Each State that adopts voting machines enacts a law specifying the requirements that must be met by the machine. The laws of the various States are copied largely from the voting machine law of the State of New York. The laws, in general, require that the machine must give the voter all the facilities for making his choice which the Australian ballot gives him, and further requires that the machine shall prevent those mistakes or frauds which if made on the Australian ballot would invalidate it. Many of the States have special requirements to meet, the solution of which present other problems, but so far the voting machine has been able to meet all of them.

The use of the machines secures accuracy both in casting and counting the vote. It eliminates the interference of the election officer with the counting of the votes. The machine gives the returns promptly and cuts down the cost of holding election. Where straight ticket voting is used the vote for each office usually runs 99% or more of the highest possible vote that could be registered. In the city of Buffalo with over 218,000 people voting, the complete vote on a large ticket for the whole city has been collected, tabulated and announced within 90 minutes of the closing of the polls. Although voting machines are used but one or two days of each year, election expenses are reduced to such an extent that the machines frequently pay for themselves in five or six elections. Where straight ticket voting is provided over 1,000 voters have frequently voted on one machine in one election day. Where straight ticket voting is not permitted as many as 600 voters have voted in one day on one machine.

In the election of Nov. 1928, about 80% of the vote of New York State was cast and counted on voting machines. Nearly 3,000 voting machines were used in the city of New York alone and all of the votes of the boroughs of Manhattan, Bronx and Brooklyn were counted on voting machines. Voting machines were also extensively used in Connecticut, Michigan, Indiana, Wisconsin, Iowa, California, Washington, Oregon, Montana and Maryland, and to a lesser extent in some of the other States. About one-sixth of all the votes of the presidential election of 1928 were cast on voting machines. (F. KEI.)

VOTKINSK, a town of Russia in the Uralsk area, on a tributary of the Kama river in 57° 5′ N., 53° 55′ E. Pop. (1926) 19,479. It manufactures agricultural machinery, and has railway and shipbuilding yards; it is the terminus of a branch railway.

VOTYAK AUTONOMOUS AREA, an administrative unit of the Russian S.F.S.R., created in 1920 from part of the former Vyatka province. Area 30,355 sq.km.; pop. (1926), 756,109. It is surrounded by the Tatar A.S.S.R., the Uralsk Area, and the province of Vyatka, and lies between 56° and 58° 30′ N. and 51° 30′ and 54° 15′ E. Geographically it includes a part of the Ural foothills forming the watershed between the Vyatka and Kama and the tributaries of the Chepsa. The soils are not very productive, consisting mainly of sands and clays and grey forest soils, and 43% of the area is forest covered, while there are vast swamps and marshes. The prevailing trees are the fir (76%) and the pine (12%); birch, ash, elm, maple and oak occur in small areas in the south. The climate is extreme, winter is long and severe and summer brief and hot; the rainfall is adequate in the north, but diminishes markedly in the south.

Agriculture is the chief occupation, but is of an extensive character; the three-field and even earlier systems are still in use. Rye and oats are the chief crop, and flax and potato cultivation increased markedly between 1925 and 1927. The famine and epidemics of 1921–22 markedly diminished the population and lessened the stamina of the survivors.

In spite of the abundance and good quality of the timber, it is not yet satisfactorily exploited, partly because of deficient transport and distance from markets and partly because of lack of skilled workers. The rivers are unfavourable for navigation and there is no steamer communication, but on many streams it is possible to float timber after the spring thaws; in summer they become very shallow. Mineral wealth includes the iron of the north-east region, slate, copper, quartz sand, chalk and red clay. Peat is abundant and has great future importance in view of the development of peat fuel as a source of electrical energy. The Varziachinsk district has been a health resort since 1888; its curative mud and sulphur springs are noted. Agriculture is insufficient to support the peasants, who supplement their income by a variety

of petty trades.

Many products of these home industries are used locally, but others are sent to the fair at Nizhniy-Novgorod, where they form about 9·8% of the turnover of peasant traders.

Factory industry is little developed except at Izhevsk (*q.v.*), the administrative centre, where there are steel works and ammunition factories and where other metal goods, including hunting guns, are produced. In the north-east there is much iron-smelting, and glass, pottery and vegetable oils are produced in the province. There are four saw-mills, and two more are under construction (1928), as is a rosin-turpentine factory.

The Perm-Vyatka railway goes through the north of the area and the Kazan-Sverdlovsk, with a branch from Izhevsk to Votkinsk (Uralsk Area), through the south. Roads are poor and are not being constructed, owing to lack of capital. The literacy rate is very low, 18% for the whole province and 14% among the Votyaks. The terrible famine conditions of 1921–22 resulted in the closing of schools. Education is at present provided for 30–40% only of children of school age.

The region was inhabited by Finnish tribes when Slav penetration and colonization began in the 12th century. For some time it was under the overlordship of Novgorod, but in the 15th century passed under that of Moscow. Though colonization went on continuously, the forest and marsh and the poor soil conditions did not prove attractive to Russian settlers and the Finnish tribes preserved their language and customs. The Votyaks (Otyaks), who call themselves Ot, Ut or Ud, and who are called Ar by the Tatars, may possibly be akin to the Ars of the Yenisei. They form 52·3% of the population and are of middle stature, with light-coloured eyes and fair, often red, hair, and Finnish skull and facial characters. Their dialect is akin to that of the Permyaks. They are mainly agricultural, factory and town populations being Russian, the latter forming 43·3% of the population.

VOUET, SIMON (1590–1649), French painter, was born at Paris on Jan. 9, 1590. He passed many years in Italy, where he married, and established himself at Rome, enjoying there a high reputation as a portrait painter. Louis XIII. recalled him to France and lodged him in the Louvre with the title of First Painter to the Crown. All royal work for the palaces of the Louvre and the Luxembourg was placed in his hands. The king became his pupil and he formed a large school, renewing the traditions of that of Fontainebleau. Among his scholars was the famous Le Brun. Vouet was an exceedingly skilful painter, especially in decoration, and executed important works of this class for Cardinal Richelieu (Rueil and Palais Royal) and other great nobles. His better easel pictures bear a curious resemblance to those of Sassoferrato. Almost everything he did was engraved by his sons-in-law.

VOUSSOIR, in architecture and building, one of the wedge-shaped stones, tiles, bricks or blocks of other material of which an arch (*q.v.*) is composed. The lowest voussoir on each side of an arch is known as a springer (*q.v.*); the highest, or central voussoir, as a keystone (*q.v.*).

VOW, a transaction between a man and a god, whereby the former undertakes in the future to render some service or gift to the god or devotes something valuable now and here to his use. The god on his part is reckoned to be going to grant or to have granted already some special favour to his votary in return for the promise made or service declared. Different formalities and ceremonies may in different religions attend the taking of a vow, but in all the wrath of heaven or of hell is visited upon one who breaks it. A vow has to be distinguished, first, from other and lower ways of persuading or constraining supernatural powers to give what man desires and to help him in time of need; and secondly, from the ordered ritual and regularly recurring ceremonies of religion.

The term vow does not apply to the uses of imitative magic in which the supernatural power is, so to speak, mechanically constrained to act by the spell or magical rite. The deities to whom vows are made or discharged are already personal beings, capable of entering into contracts or covenants with man, of understanding the claims which his vow establishes on their benevolence, and of valuing his gratitude; conversely, in the taking of a vow the petitioner's piety and spiritual attitude outweigh the ritual details of the ceremony which in magical rites are all-important. Sometimes the old magical usage survives side by side with the more developed idea of a personal power to be approached in prayer. Thus sympathetic rain charms are often combined with a prayer to the rain viewed as a personal deity. Secondly, the vow is quite apart from established cults, and is not provided for in the religious calendar. The Roman vow "was the exception, not the rule; it was a promise made by an individual at some critical moment" (W. W. Fowler, *The Roman Festivals* [London, 1899], p. 346). The vow, however, contained so large an element of ordinary prayer that in the Greek language one and the same word expressed both. The characteristic of the vow was that it was a promise either of things to be offered to a god in the future and at once consecrated to him in view of their being so offered, or of austerities to be undergone. For offering and austerity, sacrifice and suffering, are equally calculated to appease an offended deity's wrath or win his goodwill. The Bible affords many examples of vows. A thing or person vowed to the deity became holy or *tabu*, and for it nothing could be substituted.

The prohibition, to one under a vow, of flesh diet and fermented drinks is due to the belief that by partaking of these a man might introduce into his body the unclean spirits which inhabited them. The brute soul which infested meat (especially when the animal was strangled), and the cardiac demon, as the rabbis called it, which was harboured in wine, were abhorred. Similar considerations help to explain the custom of votive offerings. Any popular shrine in Latin countries is hung with wax models of limbs that have been healed, of ships saved from wreck, or with pictures representing the votary's escape from perils by land and sea, which may have had originally another significance than that of merely recording the votary's salvation and of marking his gratitude. The model ship may be a substitute for the entire ship which is become sacred to the god, but cannot be deposited in the shrine; the miniature limbs of wax are substitutes for the real limbs which now belong to the god.

VOZNESENSK, a river port in the Ukrainian S.S.R., on the left bank of the Bug river, at the head of navigation, and on the Odessa-Cherkassy railway, in 47° 32′ N., 31° 20′ E. Pop. (1926) 20,813.

VRANJA, the capital of the Vranja department of Serbia, Yugoslavia. Pop. (1921) 7,522, a large proportion being Albanians. The town is picturesquely situated on hilly ground with a stream running through it spanned by six stone and two wooden bridges. The inhabitants are employed chiefly in the cultivation of flax and hemp and in the making of ropes, but there are also cloth, glass, porcelain, iron ware, paper, boot, lamp and oven factories and leather tanneries in the town, while the fertile land around it produces wheat, maize, fruit and vegetables, as well as cattle. Vranja was captured by the Montenegrins in the Russo-Turkish war of 1877–8, and assigned to Serbia by the Treaty of Berlin (1878). The gold washing station in the district was abandoned during the World War (1914–18). Vranyska Banya, 4½ m. E., is a much frequented summer resort.

VRATSA, the capital of the department of Vratsa, Bulgaria, on the northern slope of the Stara Planina and on a small subtributary of the Danube. Pop. (1926) 15,509. Vratsa is an archiepiscopal see. Wine, leather and gold and silver filigree are manufactured, and there is a school of sericulture.

VRSAC, a town of the Banat, in the province of the Voivodina, Yugoslavia (Magyar *Versecz*). Pop. (1921) 26,975, comprising Serbs, Germans and Magyars. It is famous for its red wines and brandy. Large quantities of maize are grown in the district and some wheat and oats. There are flour mills and distilleries in the town, which also manufactures distilling and general mill machinery. It has a handsome church and is the seat of a Greek Orthodox bishop. Near the town are the remains of a Roman castle, and of a rampart and trench which extend for about 60 m. to the north. During the revolution of 1848–9 the Hungarians defeated the Serbs here in 1848 and were themselves defeated and the town occupied by the Austrians in 1849.

VRYHEID, a town in South Africa, 291 m. N. by W. of

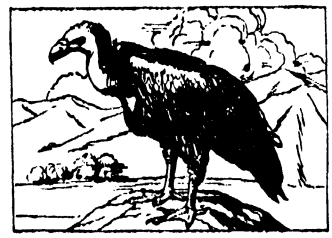
Durban; 27° 49′ S. lat., 30° 44′ E. long.; altitude 3,921 ft. Pop. (1921) 4,019 (2,062 white). In the vicinity a considerable number of important collieries are being worked. The Hlobane coalfields are south-east of the town. Vryheid is the chief centre of a district of the same name, which contains indications of gold, iron, galena, etc.

V-SHAPED DEPRESSION, in meteorology, used to describe that form of pressure distribution which is represented by isobars (*q.v.*) having the form of a letter V and enclosing an area of low pressure. The central line, through the apex of the Vs, is called the trough. The motion of the system is normally eastwards with the line of the trough remaining parallel to its earlier direction. If the trough runs north to south the winds in front of the V are largely from the south, and at the rear of the V are largely from the north. The change of wind experienced as the trough passes is often destructively sudden, and is usually accompanied by increased rainfall. (*See* SQUALL.) In general the weather sequence resembles that consequent on the passage of a circular depression and a V may usually be interpreted as a steeper gradient projection of a cyclonic system. The isobaric form contrasting with a V is termed a "wedge."

VULCAN, the Roman god of fire (*Volcanus*), and more especially of devouring flame (Virg., *Aen.* 5. 662). Whether he was also, like Hephaestus, the deity of smiths, is very doubtful; his surname *Mulciber* may rather be referred to his power to allay conflagrations. In the Comitium was an "area Volcani," also called "Volcanal"; and there on Aug. 23 (Volcanalia) the Flamen Volcanalis sacrificed, and the heads of Roman families threw into the fire small fish, which the Tiber fishermen sold on the spot.

It is not easy to explain these survivals of an old cult. But in historical times the association of this god with conflagrations becomes very apparent; when Augustus organized the city in *regiones* and *vici* to check the constant danger from fires, the *magistri vicorum* (officers of administrative districts) worshipped him as *Volcanus quietus augustus* (C. I. L. vi. 801 and 802), and on Aug. 23 there was a sacrifice to him, together with Ops Opifera and the Nymphae, which suggests the need of water in quenching the flames. At Ostia, where much of the corn was stored which fed the Roman population, the cult of this god became famous.

VULCANITE, a useful insulating material, manufactured by over-vulcanizing rubber, whence its name. Rubber rolled with a considerable proportion of sulphur and heated to a temperature of about 150°, becomes hard and capable of taking a high polish. It can be either moulded in manufacture to any required form or cut or carved when hard. It is very useful to the electrician, and, under the name of ebonite, is much used for combs, etc.



VULCANIZATION: *see* TYRE: RUBBER, PRODUCTION AND MANUFACTURE.

VULCI, an ancient town of Etruria, some 10 m. N.W. of Tarquinii. The circuit of the walls measures about 4 m., and scanty traces of them and of Roman buildings within them still exist. The Ponte della Badia over the Fiora, a bridge with a main arch of 66 ft. span, 98 ft. above the stream, is also Roman. An aqueduct passes over it. About 1½ m. above a dam has been built for a hydro-electric plant to provide at least 6,000 h.p. The former wealth of the town is mainly proved by the discoveries made in its extensive necropolis—Greek vases, bronzes, etc.—many of which are now in the Vatican. In 1828–56 over 15,000 tombs were opened. These were entirely subterranean, but some of the chamber tombs are being re-examined and cleared. There is one great tumulus, the Cucumella, and a few smaller ones. The frescoes from the François tomb, illustrating Greek and Etruscan myths, are now in the Museo Torlonia at Rome. Vulci was one of the 12 cities of Etruria. Coruncanius triumphed over the people of Vulsinii and Vulci in 280 B.C.

See S. Gsell, *Fouilles dans la nécropole de Vulci* (Paris, 1891), for the excavations of 1889 (with copious references to earlier publications); Bendinelli in *Notizie degli Scavi* 1921, 342 *sqq.*

VULGATE, a Latin version of the Bible prepared in the 4th century by St. Jerome, and so called from its common use in the Roman Catholic Church (*see* BIBLE: OLD TESTAMENT: *Texts and Versions*).

VULTURE, the name applied to a group of birds whose best-known characteristic is that of feeding on carrion. The American forms are quite distinct from the others and include the condor (*q.v.*), the Californian vulture (*Gymnogyps Californianus*), the king vulture (*Sarcoramphus papa*), with a gaudily coloured head, the turkey buzzard or turkey vulture (*Cathartes aura*), and the black buzzard, black vulture or carrion crow (*Catharista urubu*), the last two being familiar birds in southern U.S.A. They resemble the European vultures in habits.

BY COURTESY OF THE CANADIAN PACIFIC STEAMSHIPS

THE CINEREOUS VULTURE, (VULTUR MONACHUS), FOUND IN PARTS OF EUROPE, NORTH AFRICA AND ASIA

The true vultures are confined to the Old World. The cinereous vulture (*Vultur monachus*) inhabits the tropical and subtropical zones from the Straits of Gibraltar to China. The Egyptian vulture or Pharaoh's hen (*Neophron percnopterus*), which ranges over most of Africa and thence to India, is a remarkably foul feeder. Numerous other species are known.

Vultures are guided to their food, not by scent, but by sight. When one circling bird sights a corpse and drops, others see it descend, and so in a few hours scores, or even hundreds, of birds will arrive. When gorged with food vultures are often unable to rise from the ground. In all the head and neck are bare of feathers.

VYATKA, a province of the Russian S.F.S.R., surrounded by the Autonomous Komi (Zirian) Areas, the Uralsk Area, the Tatar A.S.S.R., the Votyak and Marii Aut. Area, and the Nizhegorod and North Dwina provinces. Area 108,393 sq.km. Pop. (1926) 2,222,792. It is smaller than the pre-1914 province of the same name. It has on its northern boundary the flat water-parting which separates the basins of the Northern Dwina and the Volga, and its surface is an undulating plateau 800–1,000 ft. high, deeply grooved by rivers and assuming a hilly aspect on their banks. A tongue of higher land causes the Vyatka to make its great bend to the west. The Kama flows northward along the east of the province and the Vyatka and its tributaries, the Chepsa and Molota drain the remainder of the province. The soils are mainly unproductive clayey and sandy forest soils, with wide expanses of lake and marsh, the remains of the glacial epoch. The boundary between the coniferous forest and the deciduous passes through the centre of the province, and much of the north and east consists of continuous stretches of pine, fir, larch and Siberian cedar, while there are oak and ash forests in the south.

The chief mineral wealth of the province is the iron ore of the north-east and the phosphorite of the upper Vyatka, the latter of which is only just beginning to be exploited. The timber industry is not developed on a large scale, but the peasants make every variety of wooden articles, from spoons to sledges and carts, and sell them at the Nijni-Novgorod fair. Paper manufacture is being introduced, and the match industry is flourishing, especially in the town of Vyatka. The climate is extreme, with a short hot summer and a long, cold winter, during which the snow covering is often deep. The average January temperature at Vyatka is 8·2° F, July 67° F; the rainfall is variable, ample in some years, but deficient in others. Agriculture is insufficient to support the people, who supplement their income by peasant industries, especially woodwork, small metal wares and weaving of homespun, while those in the north-east work at the mines and smelting works, and there is some hunting, especially of squirrels, in the forest. The chief crops are winter rye, oats and flax; and potatoes, barley and buckwheat are grown in lesser quantities. There is some stock-raising, especially of sheep, and pig breeding is increasing. The population is mainly Great Russian, much mixed with the Finnish tribes.

Vyatka, the chief town of the above province, is in 58° 36′ N., 49° 40′ E., on the Vyatka river. Pop. (1926) 58,619. It is an ancient trading centre established by merchants from Novgorod in 1181, and then known as Khlynov. It was plundered by the

Tatars in 1391 and 1477 and annexed by Moscow in 1489. Its name was changed to Vyatka in 1780. The town still trades in furs, wax and grain, as of old, but has a growing industrial importance. It is the chief railway repair shop for the Perm-Vyatka railway, and has a line going north to Kotlas. Its manufactures include matches, textiles, metal wares, agricultural implements.

VYAZMA, a town of Russia in the Smolensk province in 55° 11′ N., 34° 19′ E., at the confluence of the Berba and Vyazma rivers. Pop. (1926) 17,217. It is a railway junction and has leather, oil-pressing and match factories. In the 11th century it was a trade centre linked with Narva on the Gulf of Finland. It was captured by Lithuania in the 15th century, but later became Russian. From 1611–34 it was under Polish rule.

VYCPÁLEK LADISLAV (1882–), Czech composer, was born at Vrsovice near Prague in 1882. He is one of the most serious and intellectual of modern composers, leaning strongly towards mysticism and sacrificing both colour and euphony, where necessary to polyphonic requirements. His most interesting work is the cantata, *Of the Last Things of Man* (1920), which may be described as a spiritual protest against the materialism which prevailed after the World War. It is based on Moravian folk-music and consists of choruses and soprano and bass solos. Other works are: a string quartet op. 3; four sets of songs, *Visionen, Lebensfeste, In Gottes Hut* and *Erwachen;* Moravian folk-songs and ballads and pianoforte pieces. Vycpálek holds the post of librarian to Prague university.

VYERNYI (formerly Almaty), now Alma Ata (*q.v.*).

VYRNWY (*Fyrnwy*), an artificial lake or reservoir in the north-west of Montgomeryshire, North Wales, constructed for the Liverpool water-supply. It was formed by damming the river Vyrnwy, which joins the Severn above Shrewsbury.

VYSHNIY-VOLOCHOK, a town of Russia in the province of Tver, in 57° 38′ N., 34° 33′ E., on the Moscow-Leningrad railway, and on the Vyshne-Volotsk navigation system, constructed by Peter the Great in 1703–9, to connect the upper Volga with the Neva. The Mariinsk system has now largely superseded it. Saw-milling is the chief industry in this forested district, but there are also textile, glass and brewing industries.

W This letter, as its name implies, was the letter *u* or *v*, which were identical till comparatively recent times, doubled and used by the Norman scribes to represent the English bilabial spirant (modern *w*), which had previously been represented in the Saxon hands by a Runic letter. The sound did not occur in the Romance languages. Latin had possessed it, but it had passed in imperial times into the voiced labial spirant (modern *v*). A separate symbol was thus required to represent the English sound, and the French preferred the doubling of one of their own letters to the use of the Rune. (B. F. C. A.)

WA, a tribe inhabiting north-east Burma, between the Salwin River and the state of Keng-Tung. They claim to be autochthonous and may represent the aborigines of northern Siam and of Indo China; old records and travellers (*e.g.*, McLeod in 1837) speak of them as the original inhabitants. Their village sites are still found covered with jungle. The people are short and dark, and may have Negrito blood in them, though speaking a Mon-Khmer language. They are popularly divided into wild and tame. The wild Wa are head-hunters. Outside every village is an avenue of huge oaks. Along one side is a line of posts facing towards the path with skulls fitted into niches, cut sometimes in front sometimes behind the post, when there is a hole in front, through which the skull is visible. Skulls must be added annually if the crops are to be good; those of distinguished and pious men are the most efficacious, and head-hunting (*q.v.*) takes place during the sowing season. Villages are high on the slopes of hills, usually on a knoll or spur. The only entrance is through a tunnel 30 to 100 yards long, of which there are usually two at opposite sides of the village, about 5ft. high, and so narrow that two persons cannot pass freely, sometimes winding slightly to prevent gun-fire; the path is studded with pegs to prevent a rush. Tattooing is occasional only; divination is performed with chicken-bones; dogs are eaten; polygamy is permitted, monogamy prevails and the tame Wa have five clans presumably exogamous.

See Scott & Hardiman, *Gazetteer of Upper Burma, etc.* (1900).

WAALS, JOHANNES DIDERIK VAN DER (1837–1923), Dutch physicist, was born at Leyden Nov. 23, 1837. He was a self-taught man who took advantage of the opportunities offered by the university of Leyden. He first attracted notice in 1873 with his treatise *Over de continuiteit van den gas-en vloeistoftoestand* (On the continuity of the gaseous and liquid state), by which he gained his doctor's degree. He taught physics at various high schools, and in 1877 he was appointed professor of physics in the university of Amsterdam, a post which he retained until 1907. Van der Waals built up a kinetic theory of the fluid state, he combined the determination of cohesion in Laplace's theory of capillarity with the kinetic theory of gases, and this led to the conception of the continuity of the liquid and gaseous states. Using this as a starting point he arrived at an equation of state which gave an explanation of critical phenomena and fitted in very well with the experimental observations of Andrews on carbon dioxide. Continuing this work he tried to arrive at an equation which would be the same for all substances. He eventually did this by using the values of the volume, temperature and pressure divided by their critical values. This led van der Waals to his statement of the "law of corresponding states" which enabled Dewar and Onnes to determine the necessary data in the liquefaction of the permanent gases. He also discovered the law of binary mixtures. In 1910 van der Waals was awarded the Nobel Prize for physics. He died on March 9, 1923.

WABASH, a city of Indiana, U.S.A., on the Wabash river and Federal highway 24. Pop. (1920) 9,872 (96% native white). It is a manufacturing city and the trade centre for a rich agricultural region. Wabash was settled about 1834 and chartered as a city in 1866. It was one of the first cities in the world to be lighted by electricity, a lighting plant being established in February, 1880.

WABASH RAILWAY COMPANY is the oldest transportation system in the Mississippi Valley, U.S.A. The first train was run on Nov. 8, 1838. At that time the railway was known as the "Northern Cross," and ran from Meredosia to Morgan City, Illinois, a distance of 12 miles. It was almost 20 years later before "Wabash" appeared in the corporate name. The construction of the railroad across Indiana was commenced in 1855. From this small beginning the Wabash Railway Company has grown to one of the most important units in the transportation systems of America. It serves the richest section of the Central portion of the United States. The company had (1928) 2,524 m. of track; and operated, besides passenger trains, a fleet of fast freight trains serving both the industrial and agricultural market. The par value of capital stock issued to December 31, 1927, was $138,493,967.17. (J. E. Ta.)

WACE (?) ROBERT (1100?–1175?), Anglo-Norman chronicler, was born in Jersey. He studied at Caen; he became personally known to Henry I., Henry II., and the latter's eldest son, Prince Henry; from Henry II. he received a prebend at Bayeux and other gifts. Except for these facts he is known to us only as the author of two metrical chronicles in the Norman-French language. Of these the earlier in date is the *Roman de Brut,* completed in 1155, which is said to have been dedicated to Eleanor of Aquitaine (ed. A. J. V. Le Roux de Lincy, 2 vols., Rouen, 1836–38). This is a free version of the Latin *Historia Britonum* by Geoffrey of Monmouth, in rhyming octosyllables; it was rendered into English, shortly after 1200, by Layamon, a mass-priest of Worcestershire, and is also largely used in the rhymed English chronicle of Robert Mannyng. Wace's second work, the *Roman de Rou,* written between 1160 and 1174, has a less fabulous character than the *Brut,* being a chronicle of the Norman dukes from Rollo to Robert Curthose. It has been ably dissected by Gustav Körting (*Über die Quellen des Roman de Rou,* Leipzig, 1867), who shows that it is mainly based upon Dudo and William of Jumièges. There is also reason for thinking that Wace used the *Gesta regum* of William of Malmesbury. Where Wace follows no ascertainable source for the material in his chronicles he must be used with caution. Undoubtedly he used oral tradition; but he also seems in various instances to have given free play to his imagination.

The *Roman de Rou* is written in rhyming octosyllables, varied by assonanced alexandrines. It has been edited by F. Pluquet (2 vols. and supplement, Rouen, 1827–29) and more completely by H. Andresen (2 vols., Heilbronn, 1877–79). (H. W. C. D.)

WACHSMUTH, CHARLES (1829–1896), American palaeontologist, born in Hanover, Germany, Sept. 13, 1829. In 1852 he emigrated to America and after two years in New York city he settled in Burlington, Iowa. Ill health forced him into the open and he began to collect fossils, especially the crinoids, or sea lilies, of the Burlington Limestone, and in a few years he possessed a fine collection. In 1864 he became acquainted with Agassiz, and in the following year paid a visit to Europe, where he studied the crinoids in the British Museum and other famous collections. He decided to devote all his energies to the elucidation of the crinoidea, and did so with signal success. He made further extensive collections, and supplied specimens to the Harvard museum at Cambridge, Mass., and to the British Museum. Together with Frank Springer (1848–) of Burlington, he published a series of important papers on their studies of crinoids, also an extensive monograph on the *Revision of the paleocrinoida* (1879–86). After Wachsmuth's death at Burlington, on Feb. 7, 1896, appeared *The North American Crinoidea Camerata* (2 vol. and atlas, 1897).

A complete bibliography of his work is given in the *Bulletin of the Geol. Soc. of America,* vol. 8, p. 376.

WACKENRODER, WILHELM HEINRICH (1773–1798), German writer, the fellow student of Ludwig Tieck (*q.v.*) at Erlangen and Göttingen. Wackenroder inspired his friend with his own enthusiasm for the art of the middle ages. They went to Berlin in 1794, and after the breach with Nicolai there in 1796, to Dresden. The relation between mediaeval art and religion is the theme of Wackenroder's *Herzensergiessungen eines Kunstliebenden Klosterbruders* (1797). His early death, in 1798, was a great blow to his friend, who completed Wackenroder's fragmentary works.

See Wackenroder's *Werke und Briefe*, ed., in 2 vols., by F. von der Leyen (Jena, 1910); P. Koldewey, *Wackenroder und sein Einfluss auf Tieck* (1904).

WACO, a city of Texas, U.S.A. Population (1920) 38,500 (75% native white and 20% negroes); estimated locally at 60,000 in 1928. About a third of the cotton crop of Texas is grown within a radius of 100 m. of Waco. The city is the seat of Baylor University, founded at Independence in 1845 by the Texas Union Baptist Association and chartered by the Republic of Texas; and of Paul Quinn College for Negroes. The city has a commission-manager form of government, adopted in 1909. Waco was settled in 1849 and incorporated as a town in 1856. It was named after the Hueco Indians, who had a large village here until 1830, when they were nearly exterminated by the Cherokees.

WAD, a black, earthy mineral consisting mainly of hydrated manganese dioxide; of importance as an ore of manganese. Being an amorphous substance, it varies considerably in chemical composition, and contains different impurities often in large amount. A variety containing much cobalt oxide is called "asbolite," while "lampadite" is a cupriferous variety. It is very soft, readily soiling the fingers, and may be considered as an earthy form of psilomelane (*q.v.*). It results from the decomposition of other manganese minerals, and is often deposited in marshes ("bog manganese") or by springs. The name wad is of uncertain origin, and has been applied also to graphite.

WADAI, a country of north central Africa, bounded north by the Sahara and east by Darfur province of the Anglo-Egyptian Sudan. West and south-west it extended to Kanem and Bagirmi and south-east to Dar Runga. Formerly an independent Mohammedan sultanate, it was conquered by the French in 1909–10 and now forms part of the Chad colony of French Equatorial Africa. By the French it has been divided into the circumscriptions of Wadai and Batha. Total area about 80,000 sq.m. Pop. (1926 estimates) Wadai, 265,362; Batha, 187,836.

Physical Features.—Wadai is for the most part a flat, dreary plain, some 1,500 ft. in altitude, part of the clay zone which covers much of the basin of Lake Chad. It is, however, traversed by ranges of hills which rise another 1,000 ft., and east and north is encircled by mountains—part of the ranges which stretch in a rough semi-circle from Tibesti to Darfur. In the north-east Dar Tama rises to a plateau of 2,500 to 3,000 ft., with the peak of Niéré reaching 4,700 ft. The plains are mostly bush covered, but in places this gives way to long grass, with park-like regions in the west. The surface is often sandy, but there are considerable areas of black-cotton soil. To the south and east the land rises, and there are large forests, which, northward along the Darfur frontier, thin down to scrub. The northern region, bordering the Sahara is semi-arid, though much of it, watered by intermittent streams, affords good pasturage. Here, on the north-west confines of Wadai, are remarkable sand-ridges of fantastic shape—hollow mounds, pyramids, crosses, etc., which are characteristic of the Libyan desert. There are also sandstone rocks of varying colours —red, blue, pink, white, black—presenting the aspect of ruined castles, ramparts and churches. In the extreme north-east are some intermittent streams, with an easterly flow. Here the Wadi Homr, in 16° N., marks the limit of vegetation—beyond, northward, is absolute desert. South of it are many similar wadis, their banks covered with thick thorn bush. And 75 m. S. of Wadi Homr is a lake, 2 m. long by 500 yd. wide, called Undur. This desert lake dries up for half the year. Apart from this north-east region, the country forms part of the Chad drainage area. The supposition that the Bahr-el-Ghazal (of the Chad system) might afford a connection with the Nile, owing to the remarkably even level of the country for a great distance, was disproved by the investigations of Col. Jean Tilho in 1914–15. The streams which rise on the western side of the divide in the north-eastern districts, of which the Batha (over 300 m. long) is the largest, flow west, the Batha ending in a depression, some 200 m. east of Lake Chad, called Fittri. Another stream, the Wadi Rime, with a more northerly course than the Batha, goes in the direction of Chad, but ends in swamps in the clayey soil. These rivers are intermittent, and after seasons of drought Fittri is completely dry. In the dry season, water is obtained from wells 250 to 300 ft. deep. The rivers of Dar Runga—a forested district south of Wadai proper—flow westward towards the Shari, but, save the Bahr Salamat, none reaches it. They only contain water in the rainy season. About 100 m. above the Salamat-Shari confluence is Lake Iro, joined to the Salamat by a short channel.

The flora includes timber trees, numerous dum palms, mimosa, acacia, the tamarind, and many kinds of grasses. The cotton plant grows wild, and a species of wild coffee tree reaches 50 to 60 ft. and yields excellent berries. Among animals are large herds of gazelle; baboons are common, and elephants are found in the forest. Ostriches are found in the north, where the lion is also occasionally seen. Of birds, the most conspicuous are cranes (white, black and crested); storks are also common in some regions. Of domestic animals, the camel is common in the northern district, elsewhere the bull is used for transport. Horses, cattle, sheep and goats are numerous. Caterpillars are sometimes a plague, and there are visitations of locusts.

Inhabitants and Trade.—The inhabitants consist of negroid and negro tribes, Arabs, Fula, Tibbu and half-castes. The Maba, the dominant race, are said to be of Nubian origin; they live chiefly in the north-eastern district, and in the days of the sultanate were allied with the Arab tribes, known in Wadai as Zoruk (dark) and Homr (red). The Maba had a reputation for pride, valour, cruelty, drunkenness, and barbaric splendour. The usual dress of the people is, for men, a long white jibba or shirt and very baggy trousers of homespun, coarse but strong cotton; for women, the tobe, usually blue, thrown over head and shoulders, with another piece of cotton wrapped round the body to form a tight skirt. Heavy silver bangles round the ankles and silver and copper rings are worn.

The capital, Abeshr, is in the north-east in about 21° E., 13° 50′ N. Abeshr, which is set in an amphitheatre of hills, is a town of two-storeyed mud brick buildings with flat, battlemented roofs and a fine market square. The commandant's quarters are substantial buildings with barracks and a wireless station, the whole surrounded by a solid wall. The population of the town, reputed to be over 30,000 in 1873, had in 1922 dwindled to about 5,000. From Abeshr a caravan route crosses the Sahara via the Kufra oases to Benghazi in Cyrenaica. Another route, on the pilgrim way from West Africa to Mecca, goes east through Darfur to Khartoum. Maize, millet, cotton and indigo are cultivated, and cloth is woven. There is also an industry in leather goods. Ivory and ostrich feathers used to be taken to Tripoli by the desert route, together with small quantities of coffee and other produce. This trade has greatly decreased. There is a trade in cattle, horses and coffee with the Anglo-Egyptian Sudan, with the regions to the south and with Nigeria. Development is much hindered by the lack of easy transport, but good roads have been made by the French, rest houses provided, and security for travellers is assured. Until the French conquest, Wadai was a great centre of the slave trade. Slaves were obtained by raiding and in the form of tribute from Bagirmi, Kanem and other countries once dependent on Wadai. The slaves were sent north to Bengazi, or eastward to Darfur. There was also a notorious traffic in eunuchs.

History.—Wadai early became a meeting ground of negro and Arab culture. Eastern influences and the Mohammedan religion ultimately obtained predominance, though the sovereignty of the country reverted to the negro race. It was sometimes tributary to and sometimes the overlord of the neighbouring countries, such as Bagirmi and Kanem. It was made known to Europe by the writings of the Arab geographers, but it was not until Nachti-

gal's visit in 1873 that accurate knowledge of the land and people was obtained. About 1640 a Maba chieftan named Abd-el-Kerim conquered the country, driving out the Tunjur, a dynasty of Arabian origin. Thereafter Wadai, notorious as a great slave-raiding state, suffered from many civil and foreign wars. Mohammed Sherif, sultan from 1838 to 1858, introduced Senussiism.

In the last decade of the 19th century the French advancing from the Congo made their influence felt in Wadai, and by the Anglo-French declaration of March 21, 1899 Wadai was recognized as within the French sphere. That state was then torn by civil wars. The Sultan Ibrahim was murdered in 1900, and Ahmed Ghazili became sultan. He ordered one of his rivals, the Emir Acyl, to be blinded, whereupon Acyl fled westward and entered into friendly relations with the French. A few months later (Dec. 1901) Ahmed was dethroned. With Doud Murra, who then became sultan, the French endeavoured to come to an understanding, and in Nov. 1903 the Wadaians agreed to recognize the possession of Bagirmi, Kanem, etc., by France. However, in the spring of 1904, acting, it is believed, at the instigation of the Senussites, the Wadaians attacked French posts in the Shari region and carried off many slaves. Intermittent fighting continued for years. It resulted in strengthening the position of the French and of their ally Acyl, and in 1908 Doud Murra, again, it is stated, at the instigation of the Senussites, proclaimed the *jihad*. His army was split up under *aguids* (feudal lords), and was beaten in detail.

By 1912 Wadai had been completely pacified by the French and the once powerful sultanate was abolished, though the sultans of the petty states, such as Dar Tama, between Wadai and Darfur retained their authority under French protection. In the years 1913 and 1914 a terrible famine caused immense loss of life. Col. Jean Tilho says "the population of Wadai, put by Nachtigal at more than 2,000,000 in 1872, had fallen to 300,000 when I went that way [in 1917.]" Abeshr then "retained few traces of its ancient splendour"; the governor of the province had just pulled down the former palace of the sultans. Wadai was but little affected by Senussi activity during the World War. The occupation of Darfur by the Sudan government in 1916 led to better order in the borderlands, and to the demarcation of the frontier in 1923. The French had rigorously suppressed slave-trading, but other trade gradually increased, especially with the Sudan.

(F. R. C.)

WADDINGTON, WILLIAM HENRY (1826–1894), French statesman, was born at St. Remi-sur-l'Avre (Eure-et-Loir) on Dec. 11, 1826. He was the son of a wealthy Englishman who had established a large spinning factory in France and had been naturalized as a French subject. After receiving his early education in Paris, he was sent to Rugby, and thence to Trinity College, Cambridge. He undertook travels in Asia Minor, Greece and Syria, the fruits of which were published in two *Mémoires*, crowned by the Institute, and in his *Mélanges de numismatique et de philologie* (1861). His other archaeological works include the *Fastes de l'empire romain*, and editions of Diocletian's edict and of Philippe Lebas's *Voyage archéologique* (1868–1877). He was elected in 1865 a member of the Académie des Inscriptions et Belles-Lettres.

After standing unsuccessfully for the department of the Aisne in 1865 and 1869, Waddington was returned by that constituency at the election of 1871. He was minister of public instruction in the short-lived cabinet of May 19, 1873, and in 1876, having been elected senator for the Aisne, he was again entrusted by Dufaure with the ministry of public instruction. His most important project, a bill transferring the conferment of degrees to the state, passed the Chamber, but was thrown out by the Senate. He continued to hold his office under Jules Simon, with whom he was overthrown on the famous *seize mai* 1877. (*See* SIMON, JULES.)

Waddington was minister of foreign affairs under Dufaure and a French plenipotentiary at the Berlin Congress. He obtained, from Lord Salisbury, a promise that Great Britain in return for Cyprus would allow France a free hand in Tunis. Early in 1879 Waddington succeeded Dufaure as prime minister but held office only by sufferance of Gambetta, and had to retire in December. In 1883 he accepted the London embassy, which he continued to hold till 1893, showing an exceptional tenacity in defence of his country's interests. He died on Jan. 13, 1894. His wife, an American lady, whose maiden name was Mary A. King, wrote some interesting recollections of their diplomatic experiences—*Letters of a Diplomatist's Wife, 1883–1900* (New York, 1903), and *Italian Letters* (London, 1905).

WADE, BENJAMIN FRANKLIN (1800–1878), American statesman, was born near Springfield, Mass., on Oct. 27, 1800, of Puritan ancestry. He was reared on a farm, receiving little systematic education, and in 1821 he removed with his family to Andover, in the Western Reserve of Ohio. In 1825 he began the study of law at Canfield, was admitted to the bar in 1827, and began practice at Jefferson, Ashtabula county, where from 1831 to 1837 he was a law partner of Joshua R. Giddings, the anti-slavery leader. From 1851 until 1869 he was a member of the U.S. Senate, first as an anti-slavery Whig and later as a Republican. In the Senate Wade was from the first an uncompromising opponent of slavery, his bitter denunciations of that institution and of the slaveholders receiving added force from his rugged honesty and sincerity. His blunt, direct style of oratory and his somewhat rough manners were characteristic. After the outbreak of the Civil War he was one of the most vigorous critics of the Lincoln administration. He advocated the immediate emancipation and arming of the slaves, the execution of prominent southern leaders, and the wholesale confiscation of Confederate property. In 1864, with H. W. Davis (*q. v.*), he secured the passage of the Wade-Davis Bill (for the reconstruction of the southern States), the fundamental principle of which was that reconstruction was a legislative, not an executive, problem. This bill was passed by both houses of Congress, just before their adjournment, but President Lincoln withheld his signature. Soon afterward (Aug. 5) Wade and Davis published in the New York *Tribune* the famous "Wade-Davis Manifesto," a vituperative document impugning the President's honesty of purpose and attacking his leadership.

As long as President Johnson promised severe treatment of the conquered South, Wade supported him, but when the President definitively adopted the more lenient policy of his predecessor, Wade became one of his most bitter and uncompromising opponents. In 1867 he was elected president *pro tem* of the Senate, thus becoming acting vice president. He voted for Johnson's conviction on his trial for impeachment, and for this was severely criticized, since, in the event of conviction, he would have become president; but Wade's whole course before and after the trial would seem to belie the charge that he was actuated by any such motive. After leaving the Senate he resumed his law practice. He died at Jefferson, O., on March 2, 1878.

See A. G. Riddle, *Life of Benjamin F. Wade* (Cleveland, O., 1886).

WADE, GEORGE (1673–1748), British field-marshal, was the son of Jerome Wade of Kilavally, Westmeath, and entered the British army in 1690. He was present at Steinkirk in 1692, and in 1695 he became captain. In 1702 he served in Marlborough's army, earning particular distinction at the assault on the citadel of Liége. After service in Portugal, Minorca, and Spain, Wade, as major-general, was military governor at home during the Jacobite rebellion of 1715. He twice detected important Jacobite conspiracies, and on the second occasion procured the arrest of the Swedish ambassador in London, Count Gyllenborg. In 1719 he was second in command of the land forces in the "conjunct" military and naval expedition to Vigo. In 1724 he was sent to the Highlands where he began the system of metalled roads which is commemorated in the lines—

> Had you seen these roads before they were made,
> You would lift up your hands and bless General Wade.

Wade superintended the construction of 40 stone bridges and with great tact, disarmed the clans. In 1742 he was made a privy coun-

cillor and lieutenant-general of the ordnance, and in 1743 field-marshal. In this year he commanded the British contingent in Flanders, and was associated in the supreme command with the duke d'Aremberg, the leader of the Austrian contingent. The campaign, as was to be expected when the enemy was of one nation, superior in numbers and led by Saxe, was a failure, and Wade, who was seventy years of age and in bad health, resigned the command in March 1744. George II. promptly made him commander-in-chief in England, and in that capacity Field-Marshal Wade had to deal with the Jacobite insurrection of 1745, in which he was utterly baffled by the perplexing rapidity of Prince Charles Edward's marches. On the appointment of the duke of Cumberland as commander-in-chief of the forces, Wade retired. He died on March 14, 1748.

WADELAI, a place in the British protectorate of Uganda. Here the Nile suddenly contracts from a width of over half a mile to some 500 ft. and on the right (east) bank is hilly country. Wadelai was first visited by a European, Lieut. H. Chippendall, in 1875, and was named after a chieftain who, when visited by Gessi Pasha (on the occasion of that officer's circumnavigation of Albert Nyanza), ruled the surrounding district as a vassal of Kabarega, king of Unyoro. The region was annexed to the Egyptian Sudan and Wadelai's village chosen as a government post. Here Emin Pasha had his headquarters, evacuating the place in Dec. 1888. Thereafter, for some years, the district was held by the Mahdists. In Feb. 1894 the British flag was hoisted at Wadelai, the aim being to secure control of the headwaters of the Nile. Some twelve years later the government post was withdrawn. There is a native village and steamers plying between Butiaba and Nimule call at Wadelai.

WADHWAN, a town of India, in Western India States Agency, Bombay, the capital of a petty state of the same name, and the junction of the Kathiawar railway system with the Bombay and Baroda line, 389 m. N. of Bombay. Pop. (1921), 16,390. It has considerable trade and manufactures; cotton is imported and cotton stuffs and grain exported. There is a school for *girasias* or subordinate chiefs. The civil station, which is the headquarters of the agent for the Eastern Kathiawar states, had a population in 1921 of 11,721. The state of Wadhwan has an area of 242 sq.m.; pop. (1921), 37,946. Soap is manufactured, stone quarried, and cotton weaving, pressing, ginning and dyeing carried on.

WADI HALFA or HALFA, a town of the Anglo-Egyptian Sudan on the right bank of the Nile. Some 6 m. above the town is the second cataract, and on the west bank of the Nile opposite Halfa are the ruins of the ancient Egyptian city of Buhen (Bohon). Halfa is the northern terminus of the Sudan railway and the southern terminus of a steamboat service on the Nile, which, running to Shellal (Aswan), connects there with the Egyptian railways.

WAFER. A thin flat cake or biscuit. As articles of stationery, wafers consist of thin, brittle, adhesive discs, used for securing papers together, and for forming a basis for impressed official seals. They are made of a thin paste of very fine flour, baked between "wafer irons" over a charcoal fire till the thin stratum of paste becomes dry and brittle and the flour starch is partly transformed into glutinous adhesive dextrin. The cake is cut into round disks with suitable steel punches.

WAFER ASH (*Ptelea trifoliata*), a small North American tree of the rue family (Rutaceae, *q.v.*), called also shrubby tretoil and hop-tree, found from New York and southern Ontario to Nebraska and south to Florida, Arizona and Mexico, and often planted for ornament. While often shrubby, it grows sometimes 25 ft. high, and bears strong-smelling, long-stalked leaves of three leaflets and greenish-white flowers in dense clusters. The somewhat hop-like fruit is a nearly orbicular samara with a membranous, netted-veined wing, about ¾ in. broad.

WAGER: *see* GAMING AND WAGERING.

WAGES. In a broad sense, wages may be said to include all forms of income which men are able to get in return for the expenditure of their own time and energies. In this broad sense the fees paid to professional men and the royalties received by authors and inventors are wages. Employers, so far as their profits depend upon the personal supervision which they give to their affairs, and capitalists, so far as they have to give time and thought to the management of their investments, are, in this broad sense, wage earners. In a more special sense, wages, as defined by Francis A. Walker, are "the reward of those who are employed in production with a view to the profit of their employers and are paid at stipulated rates."

To say that wages may be regarded as the price of labour, and that, like other prices, wages are determined by supply and demand, is not particularly helpful. The growth of a country's population generally means an increase of its supply of labour. It does not follow, however, that labour will be cheaper in the sense that average real wages (what the labourer can buy with his money wages) will be smaller. Where there are serious obstacles to industrial development, and where agriculture is of dominating importance, as in Russia, India, or China, it may, indeed, be true that the average *per capita* production of wealth, and hence, presumably, average real wages as well, would be larger if the population were smaller. A notable rise of wages followed upon the depletion of the population of England by the Black Death in the middle of the 14th century. But where a higher stage of industrial development has been reached, it may well be that the economies of large-scale production and of the division of labour are so far dependent upon the size of the domestic market that if there were any considerable reduction of population the production of wealth *per capita* would be smaller. It cannot be assumed, therefore, that an increase of the aggregate supply of labour will normally have the effect of reducing wages. Nor can it be assumed that a general reduction of real wages would lead to the increased employment of labour (except temporarily, or when wages had been disproportionately high) in the way that a reduction of the price of a particular commodity will generally lead to larger sales. Little or nothing is to be gained by looking to the general formula of supply and demand for an explanation of the determination of wages.

The Wages-Fund Doctrine.—Some of the ablest British political economists of the 19th century thought, however, that in one particular way the general level of wages might be looked upon as the outcome of the play of the forces of supply and demand. Emphasis was put upon the circumstance that in modern industry wages are advances, in the sense that they are paid before, and often long before, the final product to which the labourer contributes in direct or indirect ways, passes into the hands of the consumer. Wages are paid out of capital, and the demand for labour depends upon the amount of capital which is or can be devoted to that purpose. The amount of capital which is, or can be, so used was dubbed the wages fund, and was held to be pre-determined, in the sense that it depended upon how much and what had been produced in the past. The present demand of consumers for commodities, it was insisted, is not a demand for labour, but merely a demand for the products of past labour. The wages-fund doctrine was not altogether untrue, but it involved misplaced emphasis, so that it led to untrue or misleading inferences. What is, at most, an important aspect of the way in which goods are produced and apportioned, was made to serve as a fundamental determinant of wages. The doctrine implies a static conception of what, as its proponents recognized in other connections, is essentially a dynamic problem. Wages are paid, not out of a fixed fund, but out of a continuing flow of wealth. Changes in the aggregate volume of that flow—changes, that is, in the magnitude of the total product of industry—have a more important bearing in the long run upon the amount which labour receives than can be attributed to variations in the relative demand for present labour and for finished goods. Through the modern mechanism of credit, moreover, the future value of part of the product of present labour is discounted, and the proceeds are used in paying present wages. A sudden increase in the total amount of money paid to labourers, such as comes sometimes after a period of industrial depression, may have the effect at first, however, of increasing the labourers' own purchases of finished products more rapidly than the supply can be replenished,

so that prices will rise, and the increase in the amount of real wages received will not be proportionate to the increased amount of money wages paid. An adherent of the wages-fund doctrine might maintain, and not without point, that this temporary effect shows how an increase of real wages is dependent upon an increase of the "fund" (the supply of goods of the kinds for which money wages are expended) from which real wages are drawn.

Wages and the Standard of Living.—Another theorem respecting wages, closely allied historically to the wages-fund doctrine, was that wages must conform very closely, in the long run, to the amount needed to enable the labouring population to maintain its customary standard of living. An early and more rigid form of this theorem had made a bare minimum of subsistence the norm to which wages were held to be constrained to approximate. In this rigid form the doctrine was taken over by some of the Socialists, named the "Iron Law of Wages," and made much of as showing the hopeless position of the labouring classes under the existing economic régime. In developing the doctrine, however, the Socialists rested it upon the power which they imputed to the owners of capital, to assign to labour no larger share of the aggregate product of industry than they conceived to be in their own interest. The grounds upon which the economists supposed their standard-of-living theory to rest were quite different, and, if they were valid, would have retained both their validity and their significance under a socialistic or any other régime. These grounds were, first, the Malthusian theory of population, serving as a basis for the affirmation that the labouring population would increase as fast as the increase of the means of maintaining its customary standard of living would permit; and second, the assumption that the level of wages must vary inversely with the supply of labour, falling off with an increase in the number of labourers, and rising with a decrease. Granting the premises the conclusions followed logically. Deviations from the normal level would be self-correcting, for an advance beyond that level would enable labourers to marry earlier and to rear larger families, so that the supply of labour would be increased and wages would be forced down again, while a fall below the supposed normal level would have the opposite series of effects. This doctrine naturally led to the pessimistic conclusion that there could be no permanent improvement of the economic status of the labouring classes except as the result of their own voluntary restriction of the growth of their numbers. On all this, it is enough to say that during the last century and a half there has been a notable increase in the level of real wages, a corresponding advance of the standard of living of wage earners. That if the rate of population growth had been slower, a yet higher general level of wages would have been attained is no more than a doubtful conjecture.

Wages and the Product of Labour.—In modern economic analysis increased emphasis is put upon the necessarily close relation between the wages which a labourer can command and the value of what he produces, and more attention has accordingly been given to the factors which are responsible for changes in the amount and value of the product of labour. At first sight it might seem to be impossible to disentangle the product of labour from the product attributable to capital, land and management. The whole product is dependent upon labour, in the sense that there would be no product if no work were done, but it is dependent in the same way upon the use of land and other natural resources, and much of it is equally dependent upon the use of capital. If there are n labourers, of equal efficiency, however, the annual product dependent upon the efforts of any one labourer will not be an nth part of the aggregate product of industry, but something considerably less than that amount. It is for the specific *increments* of product which depend upon their individual co-operation in the work of production that labourers are paid. The magnitude of the specific individual product attributable to a particular labourer will depend in some part upon his own skill and energy, but it will depend also upon how well he is supplied with tools and other appliances, upon the richness of the natural resources to which he has access, and upon the efficiency with which industry is organized and managed. If, while the supply of labour remains unchanged, the supply of productive capital is increased, if new natural resources are brought into use, if improvements are effected in either the technical processes or the general organization of industry, the increment of product dependent upon the work of any one labourer will become larger. If, on the other hand, the supply of labour is increased while the supply of other productive agents remains constant, and if no improvements are made in productive methods, the increase of the aggregate product will not be proportionate to the increase of the expenditure of labour, and the increment of product attributable to an individual labourer will shrink. (The "law of diminishing returns," *i.e.*, the theorem that unless the available supply of land can be increased, as by the cheapening of transport, or substantial improvements in methods of cultivation can be effected, the supply of agricultural produce can be increased only at the expense of a more than proportionately increased outlay of labour, is merely a particular application of this general principle.) The wages of labour, then, may be said to depend upon the magnitude of the aggregate per capita product of industry, and upon the *relative* scarcity of labour as compared with the available supply of other scarce and valuable productive agents. As has already been emphasized, an increase in the supply of labour is not inconsistent with an increase of the general level of real wages. Even in the absence of the discovery of new productive methods or of new supplies of productive resources, an increased supply of labour might lend itself to a better organization of production and to the accumulation of larger supplies of capital, so that the specific product of labour would be increased.

Differences in Wages.—These differences are of two kinds; first, differences in the wages of workmen of a given level of efficiency in different localities and in different occupations; second, differences in wages which reflect difference in skill and efficiency. Although competitive forces exert a constant pressure in the direction of equalizing the value of the different specific products which are attributable to labourers of equal efficiency (in the sense that, with like training and experience, one could do the work of another and do it equally well), these forces never completely achieve their ends, for they have to contend not only with economic inertia but with various disturbing forces. The factors which make for the persistence of local and regional variations of wages are plain to see. Habit, ignorance of better opportunities elsewhere, the initial costs of movement, local ties, political barriers, are some of them. The differences, often very large, in the general wage levels of different countries, reflect similar differences in the productivity of labour, and are associated with differences in supplies of natural resources, and in the ways in which production is organized. The international movement of capital probably counts for more than the migration of labour as an equalizing factor. Differences in the wages paid in different occupations, and in different industries where a common local or national supply of labour can be drawn upon, are attributable mostly to the circumstance that variations in the rates of growth of different industries, and in the demand for different kinds of work, cannot be met promptly by equal variations in the apportioning of the labour supply. Adam Smith observed, in a famous passage, that there are certain "normal differences" in wages, depending upon the agreeableness of the employment, the difficulty and expense of learning the trade, the constancy or inconstancy of employment, the degree of trust and responsibility entailed, and the chance of success and advancement. Such differences are both real and important, but it is to be observed that the workers who are least able to pick and choose are often forced to accept a combination of disadvantages, so that the most disagreeable and irregular employments are often those which afford the smallest opportunity for advancement, and are at the same time the poorest paid. How far the general level of wages can be advanced by the efforts of trades unions or by legislation is a debatable question, but it is certain that control of the labour market, whether by trades unions or by the Government must have definite effects upon differences in

wages. Trade union activities have the effect of increasing the difference between the wages paid in the well-organized and the unorganized trades. There is some evidence, on the other hand, that public control of wages in Australia has had the effect of diminishing the difference between the wages paid in skilled and in unskilled employments.

That there is a general relation between the ability, native and acquired, of individual workers and the wages which they can command is obvious. Allowing for disturbing factors, such as have been noted, higher wages are associated with higher degrees of ability. This does not mean, however, that wages are at all closely proportionate to ability. The evidence is far from being adequate, but such facts as are known indicate that differences in wages are more than proportionate to native differences in capacities, physical and mental. Proceeding from the lower wage levels to the higher, earning power appears to increase more rapidly than capacity, as measured by some non-economic standard of attainment. A variety of causes, probably, rather than any single cause, are responsible. Wages are paid for efficiency, not for capacity. Efficiency is a matter of education and training as well as of native capacity, and education and training are partly matters of opportunity. The higher wages paid to the more efficient workers are in some measure a return to investments in "personal capital," whether by means of education, in the ordinary sense, or by means of a period of service in some employment in which wages are small but from which paths lead upward, in preference to some better-paid employment with no larger future ahead of it. Every factor which deflects men from the paths which lead to the better paid employments, or which impedes their entry into such employments, helps to swell the numbers of the "hewers of wood and drawers of water" who compete for the poorer places, and thus operates to increase the difference between high wages and low. Moreover, in modern economic life the individual worker is a sharer in a co-operative effort. The results which he achieves cannot be measured separately, on a fixed scale of reference, as the results of a test of his physical or mental capacity might be measured. The product of industry is not got by merely adding the results of one man's work to the results of the work of others. The productivity of the individual worker is in some measure multiplied into, not merely added to, the productivity of the complex of productive agents with which he works. One man's efficiency directly affects the results which others get. More is gained by equipping a good workman with good tools or a good farmer with good land than by assigning good tools or good land to a poorer workman or a poorer farmer. The man best equipped to manage a large industrial undertaking may really earn twice as large a salary, measured by the results he gets, as a man only slightly inferior in capacity. A good foreman, by getting a maximum product from the workers under his charge, will not only increase the earnings of his men, but will earn a larger wage for himself. In short, it is probable that in many employments, though possibly not in all, the differences between the increments of product which are dependent upon the labour of a superior workman and of an inferior one are disproportionate to such differences in their skill or ability as would be revealed by a test which would deal with them as isolated individuals. It is these larger differences, of course, which are reflected in differences in the wages which they can command. (*See* also ECONOMICS.) (A. Yo.)

WAGE STATISTICS: INTERNATIONAL COMPARISONS. Few everyday questions are so complex while superficially so simple as those which take the form "How do wages in Germany, France, etc., compare with wages in this country?" It was to enable some sort of rough answer to be given to such enquiries that the British Ministry of Labour, in July, 1923, issued the first of what was to become a regular series of computations of "Comparative Real Wages in London and Certain Capital Cities Abroad." In 1924 the monthly collection of this international information was taken over by the International Labour Office at Geneva.

The first difficulty was the lack of information. Broadly speaking, up-to-date particulars of the national level of wages in any trade or occupation are for most countries either wholly lacking or too imperfect for use, while even where excellent information exists it relates in some countries to the time rates of wages agreed upon by employers and workpeople and in other countries to the actual earnings taken home by the workpeople.

Basis Chosen.—For these reasons the International Real Wage Comparisons are constructed upon what might otherwise seem to be a narrow basis—upon an average of the agreed time rates of wages in eighteen occupations in the capital or other large city of each of the countries in the comparison. These industries are the principal occupations, skilled and unskilled, in the building, engineering, furniture and printing trades. It will be obvious that such industries as agriculture, mining and shipbuilding, however important in some countries, cannot well be embraced in such an international comparison.

Some twenty countries contribute to these statistics by furnishing the International Labour Office every month with the standard time rates of wages ruling for these occupations in one or other of their great cities. From this information it can be calculated that the average London rate for 48 hours work would be say, 60/–, the average Berlin rate, say, 40 marks, the average Paris rate, say, 200 francs, and so on for each country. But the question straightway arises: how does 40 marks compare, in value to the Berlin workman, with 60 shillings to the London workman? The question is an extremely difficult one. It can be answered in a sort of a way by looking up the rate of foreign exchange and converting marks and francs into shillings at that rate; but that solution merely tells how many shillings the Berlin workman could get in exchange for the marks he earns, and it is obvious that the real issue is not how many shillings, but how many loaves and boots and other articles of daily requirement his marks will buy.

The tastes and habits of wage-earners differ greatly as between country and country. The English worker drinks much tea and little coffee, the French worker much coffee and little tea; the English worker is fond of bacon but seldom touches veal, the French is fond of veal and seldom touches bacon. And so from country to country. For these reasons the list of commodities on which the purchasing power of the various wages is to be estimated must be as far as practicable confined to articles which are consumed, in some quantity at any rate, in all the countries under comparison. The International Labour Office list comprises bread, flour and butter; margarine; eight kinds of butchers' meat, bacon, potatoes, sugar, coffee, tea, cheese, rice, eggs and milk. Even in this simple list there is hardly an item that does not present difficulties as to kind and quality.

The difficulties of obtaining comparable statistics of rent are almost insuperable. What is the value, according to some common standard of value, of the dwelling accommodation the worker of each country gets in exchange for the money he pays in rent? The information does not exist; but in view of the wide disparities due to rent legislation, the International Labour Office offers a column in which an allowance is made dubious but perhaps better than none at all, for differences in the level of rents.

Family Budgets.—In all cost of living comparisons the different items of which account is taken must be "weighted" in accordance with their importance in the normal expenditure. In other words, a "family budget" is required. Imagine a shopping basket containing a week's provisions of a typical working-class family. Take such a basket from capital to capital and ascertain in each place what the contents cost, and you have a picture of the operation necessary for establishing the prices part of the real wage comparisons. The final question is: what articles shall be put in the basket? Shall one put into it the assortment a London workman buys, or that a Milan workman buys, or that a Philadelphia workman buys? The International Labour Office has found a way out of this dilemma by making up six baskets of commodities according to the habits and tastes of workers in six widespread parts of the world and pricing the contents of each of the six baskets in each industrial centre. The computations of comparative real wages are then made for every country on the basis of each of the six baskets and on the average of the contents of the six baskets. The enquirer is thereby enabled to select a figure cor-

responding to the budget-basis he thinks most appropriate for his purpose.

Figures for 1928.—The data are given monthly in the International Labour Review. The table below is reproduced from the issue for July 1928.

In certain southern European countries, the relatively low index numbers of real wages may be accounted for in part by differences in the items of food consumption in such countries as compared with those ordinarily consumed in most of the other countries included in the table. Further, the index numbers do not show differences in the general level of real wages, even in the cities included, being based on the wages of a few categories of workers in four industries only and on the prices of a limited number of articles of food. In the second series of general averages given in the last column of the table, although an allowance is made for rent, no account is taken of expenditure on heating and lighting, furniture, clothing and other items of ordinary consumption.

Moreover, it should be noted that differences between the index numbers for any city at different dates may be due either to changes in the level of real wages in that city between those dates or to changes in the level of real wages in London. The index numbers thus show only proportionate changes in the levels of real wages in relation to those in London. In order to avoid the difficulty in comparison due to changes in the level of real wages in London, the following table is given showing index numbers of comparative real wages in various cities on the basis of real wages in London in July 1924 (= 100).

Index Numbers of Comparative Real Wages in Various Cities Based on Cost of Food Only
(Base: London, July 1924 = 100)

Active improvements in the computation are continually going forward. Three conferences under the auspices of the International Labour Office have discussed comparable data of clothing prices and rents. The ideal would be a dual series of computations, one based on time rates of wages and the other on national earnings, but the data for earnings is at present greatly lacking. Suggestions have been made for yet another series in which *family* earnings would be used as the basis, but reliable statistics of family earnings are most difficult of all to obtain. (J. H.)

BIBLIOGRAPHY.—The origin of the series is to be found in an article by J. Hilton in the *Manchester Guardian Commercial Supplement* for Oct. 26, 1922. The basis of the Ministry of Labour series is described in the Ministry of Labour *Gazette* for July, 1923. *See* also *International Labour Review* for October, 1924, for an account of how the range of the statistics was amplified and subsequent issues for accounts of various improvements introduced. For the latest records of the prices and wages used in the tabulations and the index numbers computed from them *see* the *International Labour Review passim* and the British Ministry of Labour *Gazette* in which the index-numbers are reproduced.

WAGES BOARDS: *see* INDUSTRIAL RELATIONS.

WAGES: STATISTICS OF UNITED KINGDOM.

This account of wages since 1795 should be read in conjunction with the articles on COST OF LIVING, INDEX-NUMBERS, PRICES, UNEMPLOYMENT and HOURS OF WORK. The account is restricted to estimates of wages obtainable by persons in full employment—either time-wages or average earnings on piece-rates; it deals principally with general movements, the resultant of all changes in rates, time and piece, the shifting of the numbers engaged in different occupations and all other circumstances which affect earnings.

A slow reduction of weekly hours of work took place in the half-century before the World War, and in 1919–20 hours were generally reduced to 47 or 48 per week and much greater uniformity was reached than before. It will be seen from a study of the statistics that follow that progress has been nearly continuous, when viewed broadly, through the past century, sometimes by advances of money wages, sometimes by reduction of prices, and especially in the most recent period by reduction of hours of work.

The Period 1795–1850.—The earliest general investigation into wages in the United Kingdom was made in 1886, and the study of movements before that date depends on scattered accounts, which can only be pieced together with great difficulty and some uncertainty, at least till 1850 after which date records are more numerous. Table I. exhibits the wages in some of the occupations for which records can be traced back to an early date. With the great rise of prices during the Napoleonic wars wage-rates increased by more than 50%, reaching a maximum in 1815; during the next 15 or 20 years there was an irregular fall, and then wages were nearly stationary till about 1850, at a height about one-third above that of 1790–95. If the movements of money wages are compared with those of prices, it becomes evident that a considerable advance was made in real wages between 1815 and 1850. One account gives average weekly wages of men (artisans and labourers, town and country) as 13s. 6d. in 1795, 17s. in 1807, 18s. in 1824, 16s. in 1833 and 17s. in 1850; if these are transformed into the money values of 1850 they become about 8s. 6d. in 1795, 8s. 3d. in 1807, 13s. in 1824, 13s. 6d. in 1833 and 17s. in 1850, that is to say that the average workman could buy nearly twice as much in 1850 as in 1795. To take a particular case, the Sussex agricultural labourer's wage was equivalent to 4½ pecks of wheat a week in 1795 and to 9 pecks in 1850. This is a very general statement and it may be that real wages rose somewhat less than is indicated in the 55 years.

The Period 1850–1914.—Soon after 1850 prices began to rise, and after some fluctuations culminated in 1873 and then fell rapidly, till in 1880 they were near the 1850 level again. During these 30 years it is computed that wage-rates in specific occupations rose about 30%, but owing to the relative increase of numbers in the better paid occupations average wages of all men rose

TABLE I. *Illustrative Movements in Weekly Wages*

1928	77	0	58	8	89	61	..		32	6

*Plus 12½% on week's earnings.

The first four columns are the trade-union or other agreed rates. The cotton mill-spinners' earnings are as estimated by G. H. Wood in the *Statistical Journal*, p. 135 (1910) with some adjustment of dates. The agricultural earnings are obtained by adding to the year's money receipts for weekly wages and occasional earnings the value of payments in kind, and dividing by 52. (See *Statistical Journal* p. 562; 1899.)

more than 40% and reached about 24s. weekly. The index-numbers in Table II. show the movement year by year. It is probable that prices more than kept pace with money wages till 1860, and that wages gained on prices till 1870, and in the next decade real wages made rapid progress (at the expense of some unemployment) as prices fell. Prices continued to fall irregularly till about 1895, and then rose with some interruptions, till, at the outbreak of war, the level of 1880 and of 1850 was again approximately reached.

Money wages rose from 1886 to 1890 and again from 1896 to 1900 and, after a slight fall, from 1911 to 1914. Throughout the period of falling prices real wages rose considerably, but from 1900 to 1914, or even from 1895 to 1914, it is doubtful whether money wages were as fast as prices, and some statisticians have computed that real wages fell perceptibly in the 15 or 20 years before the war.

The Period 1914–1928.—This is dealt with in detail below. By 1928 average money earnings were more than 90% above those of 1914 while prices had risen about 70%. The account now given may be thus summarized:—

Average Weekly Wages of Fully-employed Men in Great Britain

	Actual wage	Corrected to value of money in:	
		1914	1928
1795	13s. 6d.	8s. 6d.	14s. 6d.
1850	17s.	17s.	29s.
1880	24s.	24s.	41s.
1902	29s.	32s.	54s.
1914	32s.	32s.	54s.
1928	60s.	35s.	60s.

It must be emphasized that the element of approximation in these figures is very considerable; in no year can the average be certainly computed within a margin of, say, 2s., and the adjustment for the change of purchasing power of money is hazardous, even when the dates 1850, 1880 and 1914 are selected, at which prices were nearly the same; but the statement is consistent with such evidence as is available. In considering the possibility of a family living in 1795 on a weekly wage equivalent to only 14s. 6d. in our present currency, it is to be remembered that little was spent except on food, that all members of the family except the very young and very old worked, and that in the country where wages were lowest, rent was very little and garden produce and perquisites were relatively more important than now. Sufficient detail is available from 1850 onwards to allow at least an approximate account of the general movement of wages year by year. The convenient method of making the calculation and exhibiting the results is by index numbers, by which average wages in each occupation are expressed as percentages of their amount in a particular year—1914 is selected as giving the best perspective both for pre-war and post-war years—and combining the results, with due attention to the relative importance of the industries. In Table II. the figures in the column headed "A" are intended to represent the movement of the average weekly earnings (at full time) of all manual workers (male and female, adults and children) in the United Kingdom, and are based on all available information. Under "B" an alternative reckoning is given in which the gradual shifting of population to the better paid industries is ignored, so that it indicates the movement of wages for persons who remain in the same occupation. Column "C" gives the Ministry of Labour's statement from 1880 to 1914 of "the General Course of Rates of Wages," and from 1914 to 1928 of the "estimated average percentage increase in weekly full-time rates of wages generally" (100 being added to convert the percentage increase into percentages); the earlier series depends only on wages of building and engineering artisans, piece-rate changes in coal-mining and textiles and cash rates of wages of ordinary agricultural labourers; the latter series has a wider basis; but in neither is any weight given to change of relative numbers, and in both it is assumed that earnings move proportionately with piece-rates. The wage-

*Beginning of year from 1915 onwards.

censuses of 1886, 1906 and 1924 discussed below show conclusively that the Ministry of Labour's method fails to register the whole movement of average earnings.

Table III. shows the movement of average earnings in some of the industries which are included in the account of Table II. The figures are taken from G. H. Wood's paper "Real Wages and the Standard of Comfort since 1850" in the *Statistical Journal*, p. 93 (1909), the numbers in 1906 being equated to 91 in accordance with Table II.

In the column headed "A" full allowance is made for the relative changes in numbers in different occupations. Under "B" some allowance is made for changes within industries, but the relative importance of industries is assumed not to change. Under "C" are averaged the changes in time-rates in specific occupations or of piece-rates, with no allowance for relative changes in numbers or for the varying relation between piece-rates and earnings. In all cases the wages are for the normal working week at each date, and the increase in hourly rates is considerably greater than that here shown. G. H. Wood's numbers are converted from his account (*Statistical Journal* [1909], pp. 102–23 and 1912–13 p. 220) by taking the level in 1910 as 94.

It is noticeable in Tables I. and III. that the movement of wages has differed greatly in different occupations; in some there has been a steady increase, in others long periods of stationary wages, in others marked fluctuations.

Official Investigations of 1886, 1906 and 1924.—In 1886 the Board of Trade instituted an enquiry into the actual wages paid by employers in all the principal industries, and in 1906 the Labour Department of the Board of Trade made a similar investigation. The returns were voluntary at both dates, and while in those industries where the factory system had been long established a considerable proportion of employers filled in the schedules, in others, such as clothing industries and the minor metal trade, returns were sporadic and insufficient. Table IV. exhibits the results for all cases where the reports in 1886 appear to be adequate, together with estimates for coal-miners and railways in 1906 and for agriculture of both dates, which were not included in the general enquiry. Except in the principal textile and some of the metal industries, we have no assurance that the classification was the same at the two dates and detailed comparison can only be made with considerable reservations. The general averages for all industries massed together are, however, more dependable.

In 1886 the detailed enquiry was not as to actual earnings, but as to the wages or earnings obtainable by different classes for a full week. In 1906 there was a double tabulation, one for the earnings of those who worked for the normal week, without short time or overtime, the other of the earnings of all persons receiving

payment in the selected weeks. The first method is used for columns (*c*) and (*e*) in Table IV., since it agrees more closely with the method of 1886. In fact in most industries, taken as a whole, the averages are nearly the same by the two methods, since overtime nearly balanced short time. The 1924 enquiry, of which a summary is given in the *Ministry of Labour Gazette*, July 1927, was less detailed. No distinction was made by age and consequently comparison with 1906 is only possible for all males and all females as in columns (*f*) and (*g*). The returns relate to actual earnings, not to estimated earnings in a normal week, and the second tabulation of the 1906 figures is therefore used for column (*f*). Information is, however, given in 1924 about the number of hours normal in each industry and the hours actually worked in the weeks for which returns were made. Normal hours in all industries (excluding railways, mining, docks and agriculture) average 47·0 weekly, and except for building and construction where the average was 45·3 there is singular uniformity in the hours. The hours actually worked (excluding, of course, persons totally unemployed) averaged 45·6, so that if full time (without overtime) had been universal, earnings would have risen about 3%.

The averages in Table IV. have all been computed by applying to the wages the numbers recorded in the different industries in the Census of Production of 1907 and 1924 or in the Population Census, or in the reports of numbers of insured persons, and are thus independent of the numbers that happened to be included in the employers' voluntary wage-returns. In comparing the wages of boys in 1886 and 1906 and of girls at the same dates it is to be remembered that there were more half-timers at the earlier date, and in comparison between 1906 and 1924, that half-timers hardly existed at the second date, and the age of commencing work had generally risen from 13 to 14. These changes, however, have very little influence on the general averages. In the 1906 account not only are averages given but also, for each industry, the num-

TABLE V. *Rates of Wages in Typical Occupations, 1914 to 1928. Men*

For each occupation the first line gives the number of shillings for a normal week's work, and the second line expresses these amounts as percentage of the wage in July 1914.

bers at each rate of wages, and less detailed information is shown for 1886. These detailed figures lead to the following very rough comparison.

Thus in 1906 the average was 30s. 6d.; the central half earned between 23s. and 27s.; four-fifths between 19s. 6d. and 46s., one-tenth of all more than 46s. The increase in relative numbers in the higher grades of wages is very noticeable.

Changes from 1914 to 1928.—Wage-rates rose slowly in the first few months of the World War, and, when the general rise of prices became evident, were increased at frequent intervals by such amounts as were considered necessary to balance the increased cost of living. In many cases equal money increases were given to all men in an industry, skilled or unskilled, with the result that unskilled wages rose relatively to skilled. Thus in the building trade labourers' wages had been two-thirds of artisans', but at the end of the War they were more than four-fifths. A study of Table V. will show that part, but not all, of this relative gain has been preserved. Women's wages have similarly gained on men's and there has been a general levelling up of the lowest wages. Wage-rates in many cases failed to keep exact pace with prices in the years 1915–19, but piece-rates and overtime were prevalent, while unemployment practically disappeared, so that in fact the standard of living was preserved as far as was possible under the restrictions of the food-supply. In the boom of 1919 wages rose rapidly and continued to rise in 1920 after wholesale prices had begun to fall in 1920; industry entered suddenly on a period of depression at the beginning of 1921, and the wages fell rapidly from March 1921 to Dec. 1922. From the beginning of 1923 till the middle of 1928 wage-rates remained nearly stationary, but wholesale prices fell appreciably during the year 1925, 1926 and the first half of 1927 and in consequence the Cost of Living index number was 13 points (7%) lower in Jan. 1928, than in Jan. 1925.

For reasons already indicated average earnings for all workers rose more than wage-rates for individual occupations. When we compare 1928 with 1914 we find that average rates had risen by 70 to 75%, average earnings 90 to 95%, and rates for unskilled workers and for many women's occupations 100%, while the cost of living had risen only 64% and the length of the working week had fallen by some 13%. On the other hand, unemployment was prevalent, especially in mining, shipbuilding and some other important industries, and wages in mining and shipbuilding have risen less than 50%. Though engineering artisans' time-rates have only risen 45% (*see* Table V.), actual earnings of all employed in engineering and machinery and motor-car construction have increased more than 80%, and it is only those wage-earners who are on pure time-rates without bonus who have realized only the minimum increase.

Table V., most of which is compiled from the 18th *Abstract of Labour Statistics* pp. 116–19, illustrates the changes in rates that have taken place. The rates are in general the averages of those in several districts, stated to the nearest shilling or sixpence. It is to be noticed that when the reduction of hours took place in 1919 or 1920 time-rates were generally unchanged, the same sum being payable for the shortened week, but piece-rates were generally increased about 15%. It is probable that piece-workers gained by this arrangement, and that for example the percentages shown in the table for cotton, which are the arranged piece-rates without this 15% increase, underestimate the increase in earnings for those at full work; certainly in the period 1906 to 1924 during which piece-rates (apart from this 15%) rose 61%, earnings of males in the cotton trade rose over 90% and of females about 75%.

WAGES: STATISTICS OF UNITED STATES. During the World War wage rates in the United States rose appreciably, but owing to the great rise in prices the real earnings expressed in purchasing power did not gain materially and some studies show that the purchasing power actually declined. During the period following the war, and especially after 1920, a material improvement seems to have taken place. The cost of living has been declining. In most industries, there has been no marked decrease in wages; in some, wages have advanced. The Bureau of Labor Statistics carries reports on hourly rates of wages in unionized industries, and cost of living, from which Table I. is compiled.

TABLE I. *Union Wage Rates and Cost of Living, 1910-25*
(1913 = 100)

Year	Index of union rates of wages per hour	Index of cost of living	Relative purchasing power of wages as measured in cost of living
1910	94·4	93·0	101·5
1911	96·0	92·0	104·3
1912	97·6	97·6	100·0
1913	100·0	100·0	100·0
1914	101·9	103·0	98·9

1923	210·6	171·0	123·2
1924	228·1	170·7	133·6
1925	237·9	175·7	135·4
1926	250·3	175·2	142·9
1927	259·5	172·7	150·3

Since the wages are hourly rates, they do not take unemployment into account. They indicate what workers would receive if their employment were full time and constant through the year. As yet no study of American yearly earnings has been made which takes into account unemployment. In 1918 a canvass of some 12,000 families living in 92 localities in the United States was made, and a typical wage-earner's family budget was drawn up. The index number of cost of living in Table I. shows

TABLE II. *Real Earnings in Three Unorganized Industries 1910-25*

1927*	171·0	1,307	1,677	132	125

*Approximation arrived at by a method analogous to that used by Douglas.

the average movement of prices of commodities weighted according to this budget. In order to have some idea of the trend of rates of real wages in unorganized industries, the Bureau of Labor Statistics has prepared similar figures in several unorganized or partly organized industries. Table II. indicates the trend in three of these industries by giving the relative purchasing power of wages from 1910 to 1926 inclusive.

From these figures it appears that non-union rates of wages have gained more proportionately than have union rates during the years following the World War, even though they have lagged behind since 1924. But it must be remembered that they started from a considerably lower level, *e.g.*, the average union wage rate in 1913 was 45·9 cents per hour and $1.09 in 1925; the average wage rate in cotton mills in 1913 was 14·8 cents per hour and 37·2 cents in 1924; the average rate in woollen mills in 1913 was 17·7 cents and 53·3 cents in 1924; the average wage rate in the boot and shoe industry was 24 cents in 1913 and 51·6 cents in 1924. For the year 1926 the average union rate of wages per hour was $1.148 (for 1927, $1.19); while the average wage rate in cotton mills was 32·8 cents, in woollen mills 49·1 cents, and in the boot and shoe industry 52·8 cents, showing a decline since 1924 in the average wage rate in two of the unorganized industries. It should also be noted that in the unionized occupations there

TABLE IV. *Average Annual Real Earnings of Workers in Manufacturing*
(1914 = 100)

Year	Prof. Douglas' relative average annual earnings of employed workers	Relative average annual earnings of manufacturing population	Year	Prof. Douglas' relative average annual earnings of employed workers	Relative average annual earnings of manufacturing population
1910	104	115	1919	111	127
1911	97	106	1920	114	134
1912	99	107	1921	116	105
1913	101	105	1922	120	114
1914	100	100	1923	128	142
1915	100	100	1924	128	129
1916	105	120	1925	128	130
1917	104	122	1926	130	132
1918	108	129	1927	132	127

are practically no women, while in these three industries both women and men are employed. Upon the basis of these hourly rates, Prof. Paul H. Douglas has calculated the average yearly real earnings of workers in manufactures and transportation as if employed full time, taking into account the money rates and

the retail prices of commodities included in the cost of living. This, of course, gives us also a *rate* of real earnings and not the *total* of real earnings, since he does not take unemployment into account. Table III. summarizes his findings.

The rates of wages of transportation workers have been higher than the wages of manufacturing workers throughout the entire period. But the lower paid manufacturing workers have made greater proportional gains than have the transportation workers. The transportation workers are still better off, but their differential over the manufacturing group is smaller than before the war. This is the same development which was observed above in the comparison of union and non-union rates. Neither the manufacturing nor the transportation workers gained in purchasing power during the war, owing to the rapid rise of prices. The first gain came during the closing year of the war and considerable improvement has occurred since the fall in prices which began in 1920.

The writer has given another index number of real annual earnings by dividing the total pay rolls by the estimated total labouring population of these industries. This index number is to be found in column 2 of Table IV. contrasted with Douglas' average real earnings of those actually on the pay roll. This shows quite a remarkable difference. For example, in the years 1915 and 1916, Douglas shows an increase from 100 to 105 while the writer's, taking into account increased employment, increases from 100 to 120. This difference arises from the fact that Douglas' base of 100 for 1914 is $580 while the writer's, taking into account unemployment, is $479. The difference is still more striking in the years of depression in 1921 and 1922 when Prof. Douglas' index shows a steady increase of real earnings from 114 to 120 and the writer's shows a great decrease of real earnings from 134 down to 105, then, with the return of business activity, a slow rise to 114.

Finally, Douglas' index, extended to 1927, shows a steady rise to 132, whereas the writer's, taking into account total employment which now becomes practically equal to total pay roll, reaches 132 in 1926 but falls to 127 in 1927 with the decrease in employment for this latter year.

A number of factors have probably contributed to the increase in purchasing power of wages. There has been a great increase in the total annual production of the country. Not only has the total production of the country increased, but the amount per wage-earner has increased. Technological improvements have been made, processes perfected and efficiency increased. Mr. Woodlief Thomas of the Federal Reserve Board (*Proceedings of the American Economics Association*, March 1928) has computed from the census that the index of output per wage-earner in manufactures for 1909 stood at 110 relative to the output in 1899, while by 1925 it had reached 147, an increase of 36%.

Moreover, there has been a marked decline in the value of farm products in recent years and this has made for a lower cost of living. The U.S. Department of Agriculture has calculated the average purchasing power of farm products in 1919 relative to a pre-war base as 105. By 1923 it had declined to 78, and in 1927 had risen again to 87. This later rise is reflected in the increase in the cost of living since 1923 as shown in Tables I. and III.

Another major factor in well-being is the decline in immigration. The immigrant has always underbid the American worker, depressed the wage level and been difficult to unionize. This leads one to ask if trade unionism has had anything to do with this recent increase in earnings. The membership and funds of trade unions have declined during the period of the wage increases. But this is not a conclusive evidence that trade unionism has been of no value. In the first place, a rise in wages in the unionized industries is bound to increase the wages in non-union industries unless a great surplus of labour prevents it. Further, there is a growing practice among employers, in unorganized industries, of paying higher wages in an effort to keep the union out of their industries, and we must not overlook, as was explained above, that the non-union wage increases began at a much lower level than the union wages. In the second place, the decline of union membership and funds largely represents a contraction of the inflated war-time membership. (J. R. Co.)

WAGE-SYSTEMS IN INDUSTRY. The normal methods of payment for the work of persons employed in industry under the capitalist system are wage-payment and salary-payment. It is not easy to draw an absolute line of distinction between these two forms of payment. Wages are usually paid weekly and salaries over a longer period—monthly, or quarterly, for example. There are, however, cases of weekly salaries and of wages paid monthly. Moreover, a good many of the supervisory grades in various industries are paid what is called an "upstanding wage," which in many of its conditions approximates rather to the salary basis of payment than to the wage as ordinarily understood. Usually the salary-earner possesses a higher status and a slightly greater measure of security than the wage-earner. Wages are, as a rule, paid only for hours actually worked, subject to the conditions mentioned below, and any period of illness or suspension of work for any cause, whether under the worker's control or not, involves the cessation of the payment of wages. Salary-earners, on the other hand, are in many cases paid during periods of sickness, and are usually paid for a full week, or month, even if some spells of enforced absence from work or failure of work due to some other cause are included. There are, however, very many intermediate varieties between the continuous salary paid throughout the whole year and the wage paid only for hours actually worked. The salary-earner, it should be remarked, is usually entitled to a longer period of notice, from a month upward, than the wage-earner, who can usually be dismissed or suspended on a week's notice or less. The period adopted as a basis for the calculation of wages differs from trade to trade and even from district to district or factory to factory within the same trade. In some cases the basis is hourly, in others a weekly rate of wages is laid down. In either case, there may be, but in the majority of cases is not, what is termed the "guaranteed week," that is, a guaranteed minimum weekly payment, irrespective of the number of hours of employment which the employed person is actually able to secure. In certain other cases, notably that of the dockers, there is the "guaranteed day," but not the "guaranteed week." The demand for a greater measure of security than is afforded by hourly payment, without any guarantee by the week or the day, has increased, and a number of trades have secured concessions giving them guarantees of one sort or another.

Broadly speaking, the methods of remunerating the wage-earner under the wage-system can be divided into two main groups: (1) time-payments, and (2) systems of "payment by results," although there are many intermediate varieties, and disputes often arise on the question whether a particular system is or is not to be regarded as "payment by results."

(1) Under the time-work (or "day-work") system, the worker's remuneration varies with the time which he actually spends on the employer's business. Thus, carpenters and joiners in certain districts in the building industry in Great Britain have a time-rate of 1/8d. an hour, and the majority of grades on the railways have time-rates varying from 46/– per week upward. These time-rates are practically always fixed in relation to a definite number of hours in the week, and if a larger number of hours has to be worked, the hours in excess of the standard week are termed overtime, and are usually remunerated on a slightly higher hourly rate—"time and a quarter," "time and a third," "time and a half" or "double time," for example. Extra payment is also frequently made for work done during the week-end or at night ("night-shift"). The time-work system operates throughout a large number of trades, including the greater part of the building industry and the railway and road transport services, and almost the whole range of non-manual employment. In many other industries it is found side by side with various systems of "payment by results." In almost every time-work industry there are some piece-workers; and in almost every piece-work industry some time-workers. A particularly obnoxious form of time-work is that known as "task-work," under which the worker is required to perform a definite amount of labour in return for a time wage, but receives no additional remuneration

for higher output. This is strongly opposed by trade unions and does not prevail at all in organized industries in Great Britain.

(2) Under the term "payment by results" are comprehended many different methods of wage payment, the common factor among them being that, to a greater or less extent, the worker's earnings under them vary with the amount of output which he, either individually, or in conjunction with a group of his fellow-workers, is able to produce. The amount of work produced may not be the sole factor determining his remuneration under a system of "payment by results"; for such systems are very frequently, and in the organized trades usually, accompanied by guaranteed minimum or standard time-rates, which the worker is entitled to receive irrespective of the actual output which he produces. Strongly organized trade unions in many British industries have consented to accept "payment by results" only on the condition that the standard time-rates of wages shall be guaranteed irrespective of output (*e.g.*, engineering).

The simplest form of "payment by results" is that known as "piece-work." Under this system, a price is fixed for each unit of the commodity upon the production of which the worker is engaged, *e.g.*, if the worker is turning out screws, a price will be fixed per hundred, or per gross of screws, this price being calculated, in theory at least, according to the time which is estimated to be necessary for the performance of the operation in question. Sometimes, as in the "time logs" in the tailoring trade, the piece-work price is expressed not in terms of money, but in terms of hours, and the worker is paid for so many hours at the standard rate, irrespective of the time actually occupied on the job. "Straight" piece-work systems vary very much in complexity. Where the operations are simple, and the character of the goods produced uniform, piece-work prices can be laid down with almost mathematical accuracy; but as soon as provision has to be made for a wide range of different products complications almost inevitably arise. These complications are of two kinds. The cotton industry in Great Britain is almost entirely a piece-work industry; but, despite the immense variety in the types of cotton goods produced and the variation in the times required for the spinning and weaving of different types of goods, piece-work rates can be devised to correspond with practically mathematical accuracy to the time required for the job because of the high degree of standardization at which the industry has arrived. The piece-work lists agreed to by the weaving trade unions and the cotton manufacturers are immensely complicated, and only skilled technicians are able to understand them. The universal acceptance of piece-work in the cotton industry is mainly accounted for by the fact that, under the system which has been adopted, a given amount of effort can be approximately relied upon under normal conditions to produce equivalent earnings.

This is much more difficult to secure in such an industry as engineering, where the products are far less uniform and where also the machinery which the worker is called upon to manipulate is far less standardized, so that it may take very different times to do the same job on two different machines. The fixing of piece-work prices in the engineering industry in Great Britain is therefore a constant source of friction, and it has been found impossible to express, in any tables corresponding to the cotton piece-work lists, the fair remuneration for most forms of work on engineering products. Piece-work prices in the engineering industry are a constant subject of workshop and trade-union bargaining, and there is a strong resistance in many sections of the industry to the introduction of piece-work, largely because there is not, as in the cotton industry, any simple method of arriving at a fair price, and the system thus produces constant allegations of "speeding up" and "price-cutting" on the one side, and of "speeding down" and "restriction of output" on the other. Where, owing to special circumstances, it is regarded as impossible to fix in advance a piece-work price for a particular job, the worker, especially in the engineering and shipbuilding industries, is sometimes paid what is called a "lieu rate," *e.g.*, "time and a third" or "time and a half" for the hours actually occupied on the job in lieu of a fixed piece-work price.

Bonus Systems.—The other main system of payment by results is the system of "bonus on output." Under this system the worker is normally paid a time-rate irrespective of output; but, if the output exceeds a given minimum, an additional bonus, calculated upon this excess output, is paid. There are literally hundreds of different methods of calculating this bonus. The system to which the greatest attention has been attracted in recent years, both in Great Britain and in America, is the "premium bonus system" in its various forms, of which the two best-known are the "Halsey" and the "Rowan" premium bonus systems. Under both these systems, a "basis time" is fixed for the accomplishment of the piece of work in question. If the work is done in less than the basis time, the workman is paid, over and above his time-rate of wages, which is guaranteed, a bonus, proportionate in one way or another to the time saved. The effect of this method of payment is that, under both the Halsey and the Rowan system, the labour cost of the job to the employer falls with every increase in output, while at the same time the earnings of the workman increase, but not in proportion to the increase in output. The simpler of the two best-known premium bonus systems is the "Halsey" system, so called after its inventor, F. A. Halsey, an American efficiency engineer. Under this system, the workman is paid a fraction, usually either a third or a half, of his time-rate for time saved. Thus supposing the time allowed for an operation is 12 hours, and a worker, whose time-rate is a shilling an hour, does it in 9 hours, he will be paid at his time-rate for the 9 hours and in addition will receive payment for a further hour or for an hour and a half, according to the particular variety of the system adopted.

The Rowan system is more complicated. The simplest way of explaining it is to say that for every 10% that is saved on the time allowed, the workman receives a 10% increase in earnings. The more complicated way is to quote the quite unnecessarily abstruse formula which is usually adopted by those who desire to explain the system. This formula is as follows:—

$$\text{Bonus} = \frac{\text{Time saved}}{\text{Time allowed}} \times \text{Time taken.}$$

There are all manner of modifications of these two systems, both in the direction of greater simplicity and in that of greater complexity. The advocates of "scientific management" have been especially active in devising fresh variations in the method of payment, intended to stimulate the workers' productive efficiency in the fullest degree. Efficiency engineers often contend that it is necessary to work out a different formula for each type of operation in order to apply in each case precisely the right stimulus to increased output. Most of these systems are based in one way or another on the premium bonus system in one or other of its two forms, or on the so-called "differential piece-rate" system advocated by F. W. Taylor, the founder of "scientific management." Under this system, two different piece-rates are fixed for the same job, and at the same time a standard output per hour is laid down. When the worker reaches or exceeds the standard output he is paid on the higher piece-rate; when he falls below the standard of output he is paid on the lower piece-rate. Day-work rates are not guaranteed. The object of this system is stated to be the elimination from the job of the less efficient worker by discouraging him with the offer of a lower piece-work price. It is impossible to attempt to chronicle the many different bonus and piece-work systems which have been put forward in Great Britain and America. The Ministry of Munitions in England, during the World War, accumulated a list of many hundreds of different systems which were actually in operation in the British engineering shops alone. It is particularly in the engineering and kindred industries that this wide diversity of forms of wage-payment exists.

It should be noted that both the piece-work system and the various bonus systems and adaptations of them can be operated on either an individual or a collective basis. Under the individual system a single worker is remunerated in accordance with his individual output. Under the collective system a group of workers is treated as a unit, and the piece-work price or bonus

is paid in respect of the output of the whole group. Collective systems are most often found where the work itself necessarily involves collaboration, and where it is therefore difficult or impossible to separate the individual contribution of the workers engaged upon it (*e.g.*, "squad" or "gang" work). It has, however, been applied also in a large number of cases over a considerably wider area in the form of an output bonus paid on the work of a whole shop or factory. In these cases, bonus is sometimes paid only to workers directly engaged on production; but in other cases auxiliary workers, such as foremen, millwrights, maintenance workers, and even workers on the staff, may share in the pool. Many such systems were adopted in shell factories in various countries during the war. There are, moreover, signs that collective systems are finding increased favour with progressive employers, as the mechanization of industrial processes takes the control of the pace of production largely out of the control of the individual worker, while leaving it largely within the control of the workshop group as a whole.

A variety of collective "payment by results" is that which is known as the "fellowship" system. Under this system, the workers themselves form groups on a voluntary basis, and share out among themselves, either through the office of the firm, or by a subsequent re-division of the sums paid through the office, their collective earnings. This system usually operates among "fellowships" of skilled workers in a particular craft.

There are many different ways of sharing out the payment made under collective systems of "payment by results." The most usual method is that each worker included in the group shares in the payment in proportion to his time-rate and to the hours worked on the job. Sometimes, however, the pool, or any surplus over the time-rates of the workers concerned, is equally shared, and sometimes regard is paid only to one or other of the two factors mentioned above. In a few cases a specially large share in the pool is offered as an inducement to a leading worker, or to a few leading workers; but the system in this form approaches the system of "sub-contracting," which is universally objected to by the trade-union movement.

"Sub-contracting" is usually understood to mean a system under which one worker undertakes a piece of work which requires the co-ordinated labour of a group of workers. The sub-contractor receives the whole sum paid for the execution of the job, making, subject to any limitations that may be laid down in his contract, his own wage contract with the workers under him, and retaining any surplus for himself. Often a sub-contractor, himself paid "by results," remunerates the workers under him on a time-work basis. It is generally recognized that the sub-contracting system is open to grave abuse, and with the advance of trade-union organization it has been gradually eliminated from industry, surviving only in a comparatively small number of cases. The outstanding instances of it in the past have been the "butty" system in the mining industry, which still exists in one or two British coalfields, and the methods of payment which used to be common in the iron and steel industry.

Commission Payments.—Distinct from both the piece-work system and the various bonus systems is the system of "commission," which is applied in a certain number of occupations. Under this system the worker receives a commission on "takings" or on profits either as his sole mode of remuneration, or as an addition to a minimum wage or salary. This is the position of most workers in the insurance business, of many commercial travellers and of a number of managerial and semi-managerial workers in the distributive trades. It is also found occasionally in other occupations.

Recently, attention has been concentrated on the endeavours of employers to introduce systems of "payment by results" into industries in which time-work systems are at present largely in operation, *e.g.*, building, engineering, shipbuilding. Usually these attempts have met with strong trade-union opposition. It must not, however, be concluded that employers are universally favourable or trade unions universally opposed to "payment by results." The position differs from industry to industry. In the textile industries, and in a number of the less-organized occupations, "payment by results" has been introduced and maintained not merely with the acquiescence, but often at the instance of the workers, who have seen in it an opportunity of securing higher earnings. At the other extreme, the worst forms of "sweating" in industry are very frequently found in conjunction with the time-work system of payment. In the past, trade unions have usually favoured, or at least not opposed, "payment by results" in those industries in which a standard of measurement can be found of such a character as to insure that, under normal conditions, a given amount of effort expended will result in a given amount of output, and therefore of earnings under the system. On the other hand, the unions have generally been opposed to the introduction of "payment by results" in those industries in which no such standard can be laid down, as well as in other cases where it has been contended that "speeding up," consequent upon the inducement offered for higher output, would have the effect of impairing the quality of the work done (*e.g.*, building). Where "payment by results" has been accepted in industries of this latter type, a struggle has often followed over the question whether the right of the organized workers to bargain collectively over the fixing of piece-work prices or "basis times" shall or shall not be recognized. This struggle is still in progress over a wide range of industries; but the fixing of piece-work prices and "basis times" is still normally done by the employer or his representative, subject only to protest by the workers.

It should be noted that the growth of "scientific management" has given a great impetus to the introduction of "payment by results," and has also considerably affected the methods adopted by employers in fixing piece-work prices or "basis times." In the great majority of factories, other than textile factories, in which systems of payment by results are in operation, piece-work prices are still fixed in a very haphazard fashion, and modified from time to time in accordance with actual experience of their working. But, where one feature or another of "scientific management" has been introduced, experiments have been made with the object of introducing a greater scientific accuracy into the fixing of prices and times. The methods which have been introduced with this object are mainly those of "time study" and "motion study." "Time study" means an attempt, by actual observation of the doing of a particular job, either by a selected worker or in a number of selected cases, to fix the time which ought to be occupied in the doing of it by a normal worker. "Motion study" means the observation of the doing of a job with a view to eliminating all surplus motions, and to the laying down in detail of the method by which it can be done with the maximum of efficiency and in the least possible time. The former method has been adopted by a number of firms in Great Britain, the latter in comparatively few cases. Both are largely in operation in America. "Time study" and "motion study" are usually resented by the workers employed, and are regarded as devices adopted by the employer with a view of "speeding up." It is also contended that both, and especially "motion study," result in making work more monotonous and in taking such variety of initiative as remains to the worker under modern factory conditions out of his hands and in concentrating control in the hands of a small body of expert rate-fixers.

Where piece-work or bonus systems are in operation, friction is very likely to arise because there is a constant suspicion on the part of the workers that the employer is endeavouring to "cut" piece-work prices and to "speed up" the slower workers to the pace of the more rapid. Employers, on the other hand, allege that workers deliberately slow down with a view to forcing up piece-work prices. It is difficult to estimate the relative productivity of workers under time-work systems and under systems of "payment by results"; but it may be taken as certain that no system of "payment by results" which has yet been devised has succeeded in eliminating friction or the possibility of "price-cutting" on the one hand and "restriction of output" with a view to securing higher prices on the other. Perhaps the nearest approach to the elimination of these two factors is in the British cotton industry; but the comparatively smooth working of the piece-work system in this case is mainly due to the peculiar

standardized character both of the product and of the machinery. The cotton "price-list" system cannot readily be adapted for use in the majority of industries.

BIBLIOGRAPHY.—There are only two books giving a general survey of the various wage systems. These are (1) *Methods of Industrial Remuneration* by D. F. Schoss (Williams and Norgate), which was written a good many years ago, and is now in many respects out of date, and (2) *The Payment of Wages* by G. D. H. Cole (new edition, 1928) which is the most recent study. *See* also, for conditions in England, *Industrial Democracy* by Sidney and Beatrice Webb, and *The Works Manager To-day* by Sidney Webb. There is an immense literature dealing with scientific management in relation to "payment by results." Reference may be made especially to *Scientific Management and Labour* by R. F. Hoxie; *Scientific Management* by C. B. Thomson; *Scientific Management* by F. W. Taylor; *Scientific Management* by H. B. Drury; *Efficiency* and other works by Harrington Emerson; *Work, Wages and Profit* by H. L. Gantk and *Cooperative Production* by H. Atkinson. For premium bonus systems, see *The Premium System of Paying Wages,* published by *The Engineer; The Rowan Premium Bonus System* by W. Rowan Thompson; and *The Premium Bonus System, Report of an Enquiry,* published by the British Trades Union Congress. A great deal of information will also be found in the following reports issued by the Board of Trade, "Report on Collective Agreements" (1910) and "Report on Standard Piece-Rates." Unfortunately, however, no new or revised editions of these have been issued since some years before the war. *See* also the *Final Report of the Commission on Industrial Relations,* published by the U.S. Government in 1915, and the *Survey of Industrial Relations,* published by the British Committee on Industry and Trade in 1926. WAGGA WAGGA: *see* RIVERINA.

WAGNER, RUDOLPH (1805–1864), German anatomist and physiologist, was born on June 30, 1805, at Bayreuth, where his father was a professor in the gymnasium. He began the study of medicine at Erlangen in 1822, and finished his curriculum in 1826 at Würzburg, where he had attached himself mostly to J. L. Schönlein in medicine and to K. F. Heusinger in comparative anatomy. Aided by a public *stipendium,* he spent a year or more studying in the Jardin des Plantes, under the friendly eye of Cuvier, and in zoological research at Cagliari and other places on the Mediterranean. He became prosector at Erlangen and was (1832–40) professor of zoology and comparative anatomy there. In 1840 he succeeded J. F. Blumenbach at Göttingen, where he remained till his death (May 13, 1864).

Wagner's activity was enormous, his hard work being done at Erlangen while his health was good. In 1835 he communicated to the Munich academy of sciences his researches on the physiology of generation and development, including the famous discovery of the germinal vesicle of the human ovum. These were republished under the title *Prodromus historiae generationis hominis atque animalium* (Leipzig, 1836). In 1843, after his removal to Göttingen, he began his great *Handwörterbuch der Physiologie, mit Rücksicht auf physiologische Pathologie,* and brought out the fifth (supplementary) volume in 1852; the only contributions of his own in it were on the sympathetic nerve, nerve-ganglia and nerve-endings, and he modestly disclaimed all merit except as being the organizer. While resident in Italy for his health from 1845 to 1847, he occupied himself with researches on the electrical organ of the torpedo and on nervous organization generally; these he published in 1853–1854 (*Neurologische Untersuchungen,* Göttingen). Controversy arose.

He entered the lists boldly against the materialism of "Stoff und Kraft," and avowed himself a Christian believer, whereupon he lost the countenance of a number of his old friends and pupils, and was unfeelingly told that he was suffering from an "atrophy of the brain." In his later years, Wagner became anthropologist and archaeologist. His last writings were memoirs on the convolutions of the human brain, on the weight of brains, and on the brains of idiots (1860–1862).

See memoir by his eldest son in the *Göttinger gelehrte Anzeigen,* "Nachrichten" for 1864. Wagner's works include *Beiträge zur vergleichenden Physiologie des Blutes* (Leipzig, 1832–33); *Lehrbuch der vergleichenden Anatomie* (Leipzig, 1834–35); *Grundriss der Encyklopädie und Methodologie der medicinischen Wissenschaften* (Erlangen, 1838).

WAGNER, WILHELM RICHARD (1813–1883), German dramatic composer, poet and essay-writer, was born at Leipzig on May 22, 1813. In 1822 he was sent to the Kreuzschule at Dresden, and in 1828 he was removed to the Nicolaischule at Leipzig. His first music master was Gottlieb Müller, who thought him self-willed and eccentric; and his first production as a composer was an overture, performed at the Leipzig theatre in 1830. In that year he matriculated at the university, and took lessons in composition from Theodor Weinlig, cantor at the Thomasschule. A symphony was produced at the Gewandhaus concerts in 1833, and in the following year he was appointed conductor of the opera at Magdeburg. He had composed an opera called *Die Feen* adapted by himself from Gozzi's *La Donna Serpente,* and another, *Das Liebesverbot,* founded on Shakespeare's *Measure for Measure,* but only *Das Liebesverbot* obtained a single performance in 1836.

In that year Wagner married Wilhelmina Planer, an actress at the theatre at Königsberg. He had accepted an engagement there as conductor; but, the lessee becoming bankrupt, the scheme was abandoned in favour of a better appointment at Riga. Accepting this, he remained actively employed until 1839, when he made his first visit to Paris, taking with him an unfinished opera based on Bulwer Lytton's *Rienzi,* and, like his earlier attempts, on his own libretto. The venture proved most unfortunate. Wagner failed to gain a footing, and *Rienzi,* destined for the Grand Opera, was rejected. He completed it, however, and in 1842 it was produced at Dresden, where, with Madame Schroeder Devrient and Herr Tichatschek in the principal parts, it achieved a success which went far to make him famous.

Der fliegende Holländer, for which he designed a libretto quite independent of any other treatment of the legend was warmly received at Dresden on Jan. 2, 1843; but its success was by no means equal to that of *Rienzi.* Spohr, however, promptly discovered its merits, and produced it at Cassel some months later.

On Feb. 2, 1843, Wagner was formally installed as Hofkapellmeister at the Dresden theatre, and he soon set to work on a new opera. He chose the legend of Tannhäuser, collecting his materials from the ancient *Tannhäuser-Lied,* the *Volksbuch,* Tieck's poetical *Erzählung,* Hoffmann's story of *Der Sängerkrieg,* and the mediaeval poem on *Der Wartburgkrieg.* This last-named legend introduces the incidental poem of "Loherangrin," and so led Wagner to the study of Wolfram von Eschenbach's *Parzival* and *Titurel,* with great results later on. On Oct. 19, 1845, he produced his *Tannhäuser,* with Schroeder Devrient, Johanna Wagner, his niece, Tichatschek and Mitterwurzer in the principal parts. Notwithstanding this powerful cast, the success of the new work was not brilliant, for it carried still further the principles embodied in *Der fliegende Holländer,* and the time was not ripe for them. On the flight of the king, Wagner fled to Paris and thence to Zürich, where he lived in almost unbroken retirement until the autumn of 1859. During this period most of his prose works—including *Oper und Drama, Über das Dirigieren, Das Judentum in der Musik*—were given to the world.

The mediaeval studies which Wagner had begun for his work at the libretto of *Tannhäuser* bore rich fruit in his next opera *Lohengrin,* in which he also developed his principles on a larger scale and with a riper technique than hitherto.

Lohengrin was, in fact, produced at Weimar under Liszt's direction on Aug. 28, 1850. It was a severe trial to Wagner not to hear his own work, but he knew that it was in good hands, and he responded to Liszt's appeal for a new creation by studying the *Nibelungenlied* and gradually shaping it into a gigantic tetralogy. At this time also he first began to lay out the plan of *Tristan und Isolde,* and to think over the possibilities of *Parsifal.*

During his exile Wagner matured his plans and perfected his musical style; but it was not until some considerable time after his return that any of the works he then meditated were placed upon the stage. In 1855 he accepted an invitation to London, where he conducted the concerts of the Philharmonic Society with great success. In 1857 he completed the libretto of *Tristan und Isolde* at Venice, adopting the Celtic legend modified by Gottfried of Strassburg's mediaeval version. In 1859, *Tannhäuser* was accepted at the Grand Opera, Paris. Great preparations were made; it was rehearsed 164 times, 14 times with the full orchestra; and the scenery and dresses were placed entirely under the com-

poser's direction. More than £8,000 was expended upon the venture; and the work was performed for the first time in the French language and with the new Venusberg music on March 13, 1861. But, for political reasons, a powerful clique was determined to suppress Wagner. A scandalous riot was inaugurated by the members of the Parisian Jockey Club, who interrupted the performance with howls and dog-whistles; and after the third representation the opera was withdrawn. Wagner was broken-hearted, but the Princess Metternich continued to befriend him, and by 1861 she had obtained a pardon for his political offences, with permission to settle in any part of Germany except Saxony. Even this restriction was removed in 1862.

Wagner now settled for a time in Vienna, where *Tristan und Isolde* was accepted, but abandoned after fifty-seven rehearsals, through the incompetence of the tenor. *Lohengrin* was, however, produced on May 15, 1861, when Wagner heard it for the first time. His circumstances were now extremely straitened; it was the darkness before dawn. In 1863 he published the libretto of *Der Ring des Nibelungen*. King Ludwig of Bavaria was much struck with it, and in 1864 invited Wagner, who was then at Stuttgart, to come to Munich and finish his work there. Wagner accepted with rapture. The king gave him an annual grant of 1,200 gulden (£120), considerably enlarging it before the end of the year, and placing a comfortable house in the outskirts of the city at his disposal. The master expressed his gratitude in a "Huldigungsmarsch."

On June 10, 1865, at Munich, *Tristan und Isolde* was produced for the first time, with Herr and Frau Schnorr in the principal parts. *Die Meistersinger von Nürnberg*, first sketched in 1845, was completed in 1867 and first performed at Munich under the direction of Hans von Bülow on June 21, 1868. *Das Rheingold* and *Die Walküre* were performed, the one on Sept. 22, 1869, and the other on June 26, 1870. The scheme for building a new theatre at Munich having been abandoned, there was no opera-house in Germany fit for so colossal a work. A project was therefore started for the erection of a suitable building at Bayreuth (*q.v.*). Wagner laid the first stone of this in 1872, and the edifice was completed, after almost insuperable difficulties, in 1876.

After this Wagner resided permanently at Bayreuth, in a house named Wahnfried, in the garden of which he built his tomb. His first wife, from whom he had parted since 1861, died in 1865; and in 1870 he was united to Liszt's daughter Cosima, who had previously been the wife of von Bülow. Meantime *Der Ring des Nibelungen* was rapidly approaching completion, and on Aug. 13, 1876, the introductory portion, *Das Rheingold,* was performed at Bayreuth for the first time as part of the great whole, followed on the 14th by *Die Walküre,* on the 16th by *Siegfried* and on the 17th by *Götterdämmerung.*

Wagner's next and last work was *Parsifal,* based upon the legend of the Holy Grail, as set forth, not in the legend of the *Morte d'Arthur,* but in the versions of Chrestien de Troyes and Wolfram von Eschenbach and other less-known works. The libretto was complete before his visit to London in 1877. The music was begun in the following year, and completed at Palermo on Jan. 13, 1882. The first sixteen performances took place at Bayreuth, in July and August 1882, under Wagner's own directing, and fully realized all expectations.

Unhappily the exertion of directing so many consecutive performances seems to have been too much for the veteran master's strength, for towards the close of 1882 his health began to decline rapidly. He spent the autumn at Venice, and was well enough on Christmas Eve to conduct his early symphony (composed in 1833) at a private performance given at the Liceo Marcello. But late in the afternoon of Feb. 13, 1883, his friends were shocked by his sudden death from heart-failure.

Wagner was buried at Wahnfried in the tomb he had himself prepared, on Feb. 18; and a few days afterwards King Ludwig rode to Bayreuth alone, and at dead of night, to pay his last tribute to the master of his world of dreams.

In the articles on MUSIC and OPERA, Wagner's task in music-drama is described, and it remains here to discuss his progress in the operas themselves. This progress has perhaps no parallel in any art, and certainly none in music, for even Beethoven's progress was purely an increase in range and power. Wagner's earlier works have too long been treated as if they represented the pure and healthy childhood of his later ideal; as if *Lohengrin* stood to *Parsifal* as Haydn, Mozart and early Beethoven stand to Beethoven's last quartets. But Wagner never thus represented the childhood of an ideal, though he attained the manhood of the most comprehensive ideal yet known in art. To change the metaphor—the ideal was always in sight, and Wagner never swerved from his path towards it; but that path began in a blaze of garish false lights, and it had become very tortuous before the light of day prevailed. Beethoven was trained in the greatest and most advanced musical tradition of his time. In spite of all his impatience, his progress was no struggle from out of a squalid environment; on the contrary, one of his latest discoveries was the greatness of his master Haydn. Now Wagner's excellent teacher Weinlig did certainly, as Wagner himself testifies, teach him more of good music than Beethoven, Haydn and Mozart could have seen in their youth; for he showed him Beethoven. But this would not help Wagner to feel that contemporary music was really a great art; indeed it could only show him that he was growing up in a pseudo-classical time, in which the approval of persons of "good taste" was seldom directed to things of vital promise. Again, he began with far greater facility in literature than in music, if only because a play can be copied ten times faster than a full score. Wagner was always an omnivorous reader, and books were then, as now, both cheaper than music and easier to read. Moreover, the higher problems of rhythmic movement in the classical sonata forms are far beyond the scope of academic teaching, which is compelled to be contented with a practical plausibility of musical design; and the instrumental music which was considered the highest style of art in 1830 was as far beyond Wagner's early command of such plausibility as it was obviously already becoming a mere academic game. Lastly, the rules of that game were useless on the stage, and Wagner soon found in Meyerbeer a master of grand opera who was dazzling the world by means which merely disgusted the more serious academic musicians of the day.

In *Rienzi* Wagner would already have been Meyerbeer's rival, but that his sincerity, and his initial lack of that musical *savoir faire* which is prior to the individual handling of ideas, put him at a disadvantage. The step from *Rienzi* to *Der fliegende Holländer* is without parallel in the history of music, and would be inexplicable if *Rienzi* contained nothing good and if *Der fliegende Holländer* did not contain many reminiscences of the decline of Italian opera; but it is noticeable that in this case the lapses into vulgar music have a distinct dramatic value.

Spohr's appreciation of *Der fliegende Holländer* is a remarkable point in musical history; and his criticism that Wagner's style (in *Tannhäuser*) "lacked rounded periods" shows the best effect of that style on a well-disposed contemporary mind. Of course, from Wagner's mature point of view his early style is far too much cut up by periods and full closes; and its prophetic traits are so incomparably more striking than its resemblance to any earlier art that we often feel that only the full closes stand between it and the true Wagner. With all its defects, *Der fliegende Holländer* is the most masterly and the least unequal of Wagner's early works. As drama it stood immeasurably above any opera since Cherubini's *Medée.* As a complete fusion between dramatic and musical movement, its very crudities point to its immense advance towards the solution of the problem, propounded chaotically at the beginning of the 17th century by Monteverde, and solved in a simple form by Gluck. And as the twofold musical and dramatic achievement of one mind, it already places Wagner beyond parallel in the history of art.

Tannhäuser is on a grander scale, but its musical execution is disappointing. The weakest passages in *Der fliegende Holländer* are not so helpless as the original recitatives of Venus in the first act; or Tannhäuser's song, which was too far involved in the whole scheme to be ousted by the mature "New Venusberg music" with which Wagner fifteen years later got rid both of the end of the overture and what he called his "Palais-Royal" Venus.

It is really very difficult to understand Schumann's impression that the musical technique of *Tannhäuser* shows a remarkable improvement. Not until the third act does the great Wagner arbitrate in the struggle between amateurishness and theatricality in the music, though at all points his epoch-making stagecraft asserts itself with a force that tempts us to treat the whole work as if it were on the Wagnerian plane of Tannhäuser's account of his pilgrimage in the third act.

After even the finest things in *Tannhäuser,* the *Vorspiel* to *Lohengrin* comes as a revelation, with its quiet solemnity and breadth of design, its ethereal purity of tone-colour, and its complete emancipation from earlier operatic forms. The suspense and climax in the first act is so intense, and the whole drama is so well designed, that we must have a very vivid idea of the later Wagner before we can see how far the quality of musical thought still falls short of his ideals. The elaborate choral writing sometimes rises to almost Hellenic regions of dramatic art; and there is no crudeness in the passages that carry on the story quietly in reaction from the climaxes—a test far too severe for *Tannhäuser* and rather severe for even the mature works of Gluck and Weber.

The crowning complication in the effect of *Der fliegende Holländer, Tannhäuser* and *Lohengrin* on the musical thought of the 19th century was that the unprecedented fusion of their musical with their dramatic contents revealed some of the meaning of serious music to ears that had been deaf to the classics. Wagnerism was henceforth proclaimed out of the mouths of babes and sucklings; learned musicians felt that it had an unfair advantage; and by the time Wagner's popularity began to thrive as a persecuted heresy he had left it in the lurch.

Wagner had hardly finished the score of *Lohengrin* before he was at work upon the poem of *Der Ring des Nibelungen.* And with this he suddenly became a mature artist. Wagner's choice of subjects had from the outset shown an imagination far above that of any earlier librettist; yet he had begun with stories which could attract ordinary minds, as he dismally realized when the libretto of *Der fliegende Holländer* so pleased the Parisian wire-pullers that it was promptly set to music by one of their friends. But with *Der Ring des Nibelungen* Wagner devoted himself to a story which any ordinary dramatist would find as unwieldy as, for instance, most of Shakespeare's subjects; a story in which ordinary canons of taste and probability were violated as they are in real life and in great art. Wagner's first inspiration was for an opera (*Siegfrieds Tod,* projected in 1848) on the death of Germany's mythical hero; but he found that the story needed a preliminary drama to convey its antecedents. This preliminary drama soon proved to need another to explain it, which again finally needed a short introductory drama. Thus the plan of the *Ring* was sketched in reverse order; and it has been remarked that *Götterdämmerung* shows traces of the fact that Wagner had begun his scheme in the days when French grand opera, with its ballets and pageantry, still influenced him. There is little doubt that some redundant narratives in the *Ring* were of earlier conception than the four complete dramas, and that their survival is due partly to Wagner's natural affection for work on which he had spent pains, and partly to a dim notion that (like Browning's method in *The Ring and the Book*) they might serve to reveal the story afresh in the light of each character. Be this as it may, we may confidently date the purification of Wagner's music at the moment when he set to work on a story which carried him finally away from that world of stereotyped operatic passions into which he had already breathed so much disturbing life.

In *Lohengrin* we take leave of the early music that obscured Wagner's ideals, and in the *Ring* we come to the music which transcends all other aspects of Wagnerism. Had Wagner been a man of more urbane literary intellect he might have been less ambitious of expressing a world-philosophy in music-drama; and it is just conceivable that the result might have been a less intermittent dramatic movement in his later works, and a balance of ethical ideas at once more subtle and more orthodox.

If we wish to know what Wagner means, we must fight our way through his drama to his music; and we must not expect to find that each phrase in the mouth of the actor corresponds word for note with the music. That sort of correspondence Wagner leaves to his imitators; and his views on "Leit-motif-hunting," as expressed in his prose writings and conversation, are contemptuously tolerant. We shall indeed find that his orchestra interprets the dramatic situations which his poetry roughly outlines. But we shall also find that, even if we could conceive the poetry to be a perfect expression of all that can be given in words and actions, the orchestra will express something greater; it will not run parallel with the poetry; the *Leitmotif* system will not be a collection of labels; the musical expression of singer and orchestra will not be a mere heightened resource of dramatic declamation. All that kind of pre-established harmony Wagner left behind him the moment he deserted the heroes and villains of romantic opera for the visionary and true tragedy of gods and demi-gods, giants and gnomes, with beauty, nobility and love in the wrong, and the forces of destruction and hate set free by blind justice.

In Wagner's harmonic style we encounter the entire problem of modern musical texture. Wagner effected vast changes in almost every branch of his all-embracing art, from theatre-building and stage-lighting to the musical declamation of words. Most of his reforms have since been intelligently carried out as normal principles in more arts than one; but, shocking as the statement may seem to 20th-century orthodoxy, Wagnerian harmony is a universe as yet unexplored, except by the few composers who are so independent of its bewildering effect on the generation that grew up with it, that they can use Wagner's resources as discreetly as he used them himself. The last two examples at the end of the article on HARMONY show almost all that is new in Wagner's harmonic principles. The peculiar art therein is that while the discords owe their intelligibility and softness to the smooth melodic lines by which in "resolving" they prove themselves but transient rainbow-hues on or below the surface, they owe their strangeness to the intense vividness with which at the moment of impact they suggest a mysteriously remote foreign key. Wagner's orthodox contemporaries regarded such mixtures of key as sheer nonsense; and it would seem that the rank and file of his imitators agree with that view, since they either plagiarize Wagner's actual progressions or else produce such mixtures with no vividness of key-colour and little attempt to follow those melodic trains of thought by which Wagner makes sense of them. There is far more of truly Wagnerian harmony to be found before his time than since. It was so early recognized as characteristic of Chopin that a magnificent example may be seen at the end of Schumann's little tone-portrait of him in the *Carnaval:* a very advanced Wagnerian passage on another principle constitutes the bulk of the development in the first movement of Beethoven's sonata *Les Adieux;* while even in the "Golden Age" of music, and within the limits of pure diatonic concord, the unexpectedness of many of Palestrina's chords is hardly less Wagnerian than the perfect smoothness of the melodic lines which combine to produce them.

Wagnerian harmony is, then, neither a side-issue nor a progress *per saltum,* but a leading current in the stream of musical evolution. That stream is sure sooner or later to carry with it every reality that has been reached by side-issues and leaps; and of such things we have important cases in the works of Strauss and Debussy. Strauss makes a steadily increasing use of avowedly irrational discords, in order to produce an emotionally apt physical sensation. Debussy has this in common with Strauss, that he too regards harmonies as pure physical sensations; but he differs from Strauss firstly in systematically refusing to regard them as anything else, and secondly in his extreme sensibility to harshness. We have seen (in the articles on HARMONY and MUSIC) how harmonic music originated in just this habit of regarding combinations of sound as mere sensations, and how for centuries the habit opposed itself to the intellectual principles of contrapuntal harmony. These intellectual principles are, of course, not without their own ground in physical sensation; but it is evident that Debussy appeals beyond them to a more

primitive instinct; and on it he bases an almost perfectly coherent system of which the laws are, like those of 12th-century music, precisely the opposite of those of classical harmony. The only illogical point in his system is that the beauty of his dreamlike chords depends not only on his artful choice of a timbre that minimizes their harshness, but also on the fact that they enter the ear with the meaning they have acquired through centuries of harmonic evolution on classical lines. There is a special pleasure in the subsidence of that meaning beneath a soothing sensation; but a system based thereon cannot be universal. Its phenomena are, however, perfectly real, and can be observed wherever artistic conditions make the tone of a mass of harmony more important than the interior threads of its texture. This is of constant occurrence in classical pianoforte music, in which thick chords are subjected to polyphonic laws only in their top and bottom notes, while the inner notes make a solid mass of sound in which numerous consecutive fifths and octaves are not only harmless but essential to the balance of tone. In Debussy's art the top and bottom are also involved in the antipolyphonic laws of such masses of sound, thus making these laws paramount.

LIST OF WAGNER'S WORKS

The following are Wagner's operas and music-dramas, apart from the unpublished *Die Hochzeit* (three numbers only), *Die Feen*, and *Das Liebesverbot* (*Das Liebesverbot* was disinterred in 1910).

1. *Rienzi, der letzte der Tribunen: grosse tragische Oper;* 5 acts (1838–40).
2. *Der fliegende Holländer: romantische Oper;* 1 act, afterwards cut into 3 (1841).
3. *Tannhäuser und der Sängerkrieg auf Wartburg: romantische Oper;* 3 acts (libretto, 1843; music, 1844–45; new Venusberg music, 1860–61).
4. *Lohengrin: romantische Oper;* 3 acts (libretto, 1845; music, 1846–48). This is the last work Wagner calls by the title of Opera.
5. *Das Rheingold,* prologue in 4 scenes to *Der Ring des Nibelungen; ein Bühnenfestspiel* (poem written last of the series, which was begun in 1848 and finished in 1851–52; music, 1853–54).
6. *Die Walküre: der Ring des Nibelungen, erster Tag;* 3 acts (score finished, 1856).
7. *Tristan und Isolde;* 3 acts (poem written in 1857; music, 1857–1859).
8. *Siegfried: der Ring des Nibelungen, zweiter Tag;* 3 acts, the first two nearly finished before *Tristan,* the rest between 1865 and 1869.
9. *Die Meistersinger von Nürnberg;* 3 acts (sketch of play, 1845; poem, 1861–62; music, 1862–67).
10. *Götterdämmerung: der Ring des Nibelungen, dritter Tag;* introduction and 3 acts (*Siegfried's Tod* already sketched dramatically in 1848; music, 1870–74).
11. *Parsifal: ein Bühnenweihfestspiel* (a solemn stage festival play), 3 acts (poem, 1876–77; music, 1877–82, *Charfreitagszauber* already sketched in 1857).

As regards other compositions, the early unpublished works include a symphony, a cantata, some incidental music to a pantomime, and several overtures, four of which have recently been discovered and produced. The important small published works are *Eine Faust Overture* (1839–40; rewritten, 1855); the *Siegfried Idylle* (an exquisite serenade for small orchestra on themes from the finale of *Siegfried,* written as a surprise for Frau Wagner in 1870); the *Kaisermarsch* (1871), the *Huldigungsmarsch* (1864) for military band (the scoring of the concert-version finished by Raff); *Fünf Gedichte* (1862), a set of songs containing two studies for *Tristan;* and the early quasi-oratorio scene for male-voice chorus and full orchestra, *Das Liebesmahl der Apostel* (1843). Wagner's retouching of Gluck's *Iphigenie en Aulide* and his edition of Palestrina's *Stabat Mater* demand mention as important services to music, by no means to be classified (as in some catalogues) with the hack-work with which he kept off starvation in Paris.

The collected literary works of Wagner in German fill ten volumes, and include political speeches, sketches for dramas that did not become operas, autobiographical chapters, aesthetic musical treatises and polemics of vitriolic violence. Their importance will never be comparable to that of his music; but, just as the reaction against Ruskin's ascendancy as an art-critic has coincided with an increased respect for his ethical and sociological thought, so the rebellious forces that are compelling Wagnerism to grant music a constitution coincide with a growing admiration of his general mental powers. The prose works have been translated into English by W. A. Ellis (8 vols., 1892–99). The translation by F. Jameson (1897) of the text of the *Ring* (first published in the pocket edition of the full scores) is the most wonderful *tour de force* yet achieved in its line. A careful reading of the score to this English text reveals not a single false emphasis or loss of rhetorical point in the fitting of words to notes, nor a single extra note or halt in the music; and wherever the language seems stilted or absurd the original will be found to be at least equally so, while the spirit of Wagner's poetry is faithfully reflected. Such work deserves more recognition than it is ever likely to get. Rapidly as the standard of musical translations was improving before this work appeared, no one could have foreseen what has now been abundantly verified, that the *Ring* can be performed in English without any appreciable loss to Wagner's art. The same translator has also published a close, purely literary version.

BIBLIOGRAPHY.—The Wagner literature is too enormous to be dealt with here. The standard biography is that of Glasenapp (6 vols., of which five appeared between 1894 and 1909). Of readable English books we may cite Ernest Newman, *A Study of Wagner* (1899); H. E. Krehbiel, *Studies in the Wagnerian Drama* (1891); Jessie L. Weston, *Legends of the Wagner Dramas* (1906). *The Perfect Wagnerite,* by G. Bernard Shaw, though concerned mainly with the social philosophy of the *Ring,* gives a luminous account of Wagner's mastery of musical movement. The highest English authority on Wagner is his friend Dannreuther, whose article in *Grove's Dictionary* is classical. A new study of Wagner's participation in the Dresden affair is set forth by Woldemar Lippert, *Richard Wagner's Verbannung und Ruckkehr, 1849–1862* (1929).

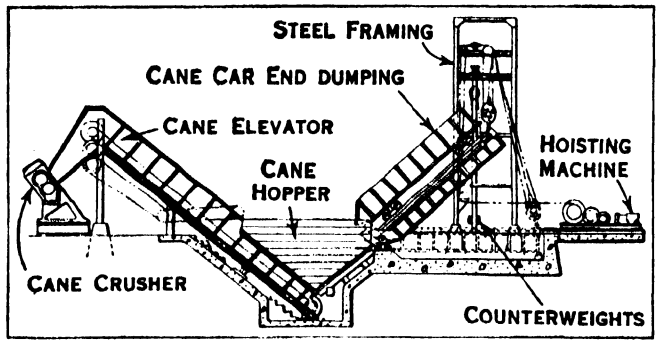
WAGON or **WAGGON,** a large four-wheeled vehicle for the carriage of heavy loads, and drawn by two or more horses. This is the general English use of the term, where it is more particularly confined to the large vehicles employed in the carrying of agricultural produce. It is also used of the uncovered heavy rolling stock for goods on railways. (*See* RAILWAYS.) In America the term is applied also to lighter vehicles, such as are used for express delivery, police work, etc., and to various forms of four-wheeled vehicles used for driving, to which the English term "cart" would be given.



WAGONS-LITS, COMPAGNIE INTERNATIONALE DES. The International Sleeping Car company was started in 1876 by M. Georges Nagelmackers who purchased the patent of the "Mann Railway Sleeping Car Carriage" from America to provide sleeping car accommodation in Europe. It was only between 1883 and 1896 that contracts with the main railways in France were definitely concluded and the company put on a firm basis. This period saw the inauguration of the Orient express, the Sud express, the Mediterranean express, and, in 1885, the extension of the Orient and Ostend-Vienna expresses to Constantinople. In 1896, the inception of the Nord express services took place, linking Paris and St. Petersburg, and in 1897, the Nord-Brenner express, uniting Berlin, Milan and Naples. In 1898, complete sleeping car trains, together with restaurant wagons, were run throughout Europe, and the Trans-Siberian service from Moscow to Irkutsk, and finally the service from Vladivostock to the Pacific first functioned. In 1906, the Simplon Pass being opened, the company at once started the Simplon express, uniting Paris, Milan and Venice. The World War in 1914 disorganised the services, and it was not until 1920 that all these were running again in full and the famous train, Calais-Mediterranean, known as the "Blue Train," was first commissioned. From 1923 onwards, great strides were made, especially in the Oberland and Engadine expresses, also the Pyrénées Côte-d'Argent. In 1926 the company included Pullman trains similar to those run by the Pullman company in England, on such trains as the Sud express between Paris and Madrid, the "Golden Arrow" between Paris and London, the Edelweiss express, Antwerp-Basle, and the "North Star," Paris-Amsterdam. The two last mentioned trains have both first and second class Pullmans.

In 1928, the company acquired the capital of Messrs. Thomas Cook and Son, thereby extending their amenities to all classes of travellers and tourists. The Sleeping Car company, as it now exists, can safely be said to be the most extensive travel bureau in the world, having numerous agencies in all corners of the globe. (H. M. S.)

WAGON TIPPLERS. The unloading of mineral wagons by manual labour is a tedious and expensive operation which has an adverse economic effect on all industrial undertakings which employ coal as fuel, and minerals generally as raw product. Ordinary standard rolling stock for the conveyance of minerals is provided with side doors through which a relatively small proportion of the material falls out by gravity, when they are opened,

while the remainder has to be raked and shovelled out. In this way a man can unload at the rate of four to five tons per hour, and the actual cost of unloading one ton might be taken as 20% to 25% of his hourly wage.

A better method is to use hopper wagons, or, as they are sometimes called, "self-unloaders." As their name implies, they are wagons hoppered at the base in four directions, the inverted cone

FIG. 1.—END TIPPLER BY WHICH THE WAGONS ARE LIFTED FROM THE REAR BY HOISTING MACHINERY

outlet being closed by a sliding gate, on the opening of which the whole of the contents runs out by gravity. The drawback to this otherwise excellent device is that such wagons are useless for other freight and have therefore to be returned idle, so that it would not pay railway companies to provide them.

Private owners, however, find these wagons very successful, particularly in cases where the haulage distance is not great and where they can be in continuous use between, say, a quarry or mine and a factory. Such users are, however, few and far between.

End Tipplers.—By the combined efforts of railway companies and industrials the unloading of railway wagons was mechanized just before the end of the last century. The railway companies provided thousands of mineral wagons with hinged end doors in place of side doors, and the industrials provided pits beneath the rails, at the points where they wished to unload, for receiving the coal and accommodating the mechanical lifting devices which engage, by means of "crutches," with the rear axles of the trucks, lifting the rear ends sufficiently high for the material to flow out

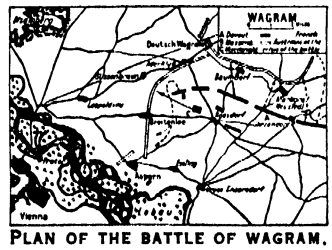
FIGS. 2, 3, 4 & 5.—DIAGRAMS SHOWING OPEN-CRADLE TYPE OF SIDE TIPPLER

through the end doors, while the other pair of wheels remains on the rails. The lifting device consists either of a hydraulic ram, a screw-operated ram or one with a tooth-rack and pinion. An alternative lifting method is a hoisting gear in an overhead position, which, with the aid of a wire rope, raises the rear end of the wagon. In fig. 1 such an arrangement is shown for unloading sugar-cane. End tipplers with rams, as described, though in many ways satisfactory, have one inherent drawback, viz., that the wagons cannot be raised beyond an angle of 40° to 45°, since the buffers foul the rails at a steeper incline and small, particularly

washed, coal will not slide out without manual assistance. In order to get a clean discharge for all materials an angle of 45° to 55° is necessary, and this may be obtained by cutting out a section of the rail track a few feet longer than the largest wagon and developing this into a hinged platform, to the end of which the lifting ram is swivelled. The wagon to be unloaded is secured to this platform in such a position that an increase of tilt is possible without the buffers touching the rails. As an alternative the rails are kept intact and an independent hinged lifting frame is used. With all end tipplers it is imperative that the trucks be delivered on the siding with their end doors foremost, otherwise some shunting or the use of a turntable becomes necessary. In some cases it may be undesirable, on account of the ground water, to make deep excavations for the accommodation of the lifting ram, its motor and speed reduction gear. This difficulty also has been overcome by tipplers which can be tipped either way, of which there is quite a number of types. Generally speaking, end trucks require from four to five minutes to tip.

Rotary Side Tipplers.—These are recommended for larger capacities. They are all similar in external appearance but quite a number of types have been built. In order to reduce manual labour to a minimum it is essential that the wagons should be held by automatic means during the tippling process, and that these should be capable of adaptation to the widely different types of mineral wagons. For instance, 20-ton capacity, high-sided wagons, and those of eight tons, low-sided, have to be handled by the same means. Moreover, the device must accomplish this without causing any damage to the wagons. A great variety of such sustaining devices form integral parts of the standard tipplers. Where several trucks have to be discharged quickly these devices act automatically, but for smaller capacities they can be adjusted by hand. These, like most side tipplers, are of squirrel-cage type and built in two varieties: one in which the wagon is clamped in position on the cradle by hand and the other where the operation is carried out mechanically. The former is slower and therefore handles fewer wagons per hour than the latter. The great advantage of such tipplers is that any type of wagon can be handled by them, whether with side doors, end doors or no doors at all. The operation is as follows. The wagon is simply run into the tippler, the driving gear is started up and the tippler commences to revolve. As soon as the framing begins to rotate the wagon is lowered at one side, by means of a pivoted rocking table, against the side chock. The continued rotation of the tippler framing causes the cradle in which the wagon is contained to slide in the outer tippler rings until the top of the wagon comes in contact with the longitudinal sustaining beam at the top of the tippler framing, and the tippler then continues to revolve until the wagon is inverted sufficiently to discharge its contents. The process is now reversed, the cradle containing the wagon gradually sinking down to the initial position, the empty wagon being pushed out by a full one. The action of the sliding cradle with the wagon in it is controlled by means of a dashpot, in order to prevent shock.

Hand labour is almost entirely dispensed with.



In another type an open cradle has been substituted for the squirrel-cage. The wagon is shown in the initial position in fig. 2. When rotation begins it is tilted gently till it leans against the longitudinally supporting chock (fig. 3); then it further rotates through an angle of 90°, at which point the top of the wagon encounters a longitudinal sustaining beam. As the wagon continues to turn slowly over, an increasing proportion of its weight is borne by the beam until, when fully turned, it rests, as it were, in a V formed by the supporting chock and the sustaining beam, both of which are covered with hemp, fender-like, where they touch the wagons (fig. 4). In fig. 5 the wagon is shown in the unloading position. After emptying, the wagons are returned to their initial position, when they are absolutely free to be shunted off the cradle. The advantage of the open cradle over the squirrel cage is that a shunting engine can pass over the tippler. An objection to side tipplers is that the oil may run out of the axle boxes. But the operation is too quick for this to happen, and the latest arrangement is an "inkwell" type of oil reservoir.

Where wagons of large capacities are in use, as in America, the end-tipping method is impracticable. In that country rotary side tipplers only are employed, which, in the majority of instances, are raised to a higher level before reaching the unloading position. (*See* LOCOMOTIVE COALING.)

In Germany end tipplers only are employed, since side tipplers are debarred by the railway authorities. (G. F. Z.)

WAGRAM or **DEUTSCH WAGRAM,** a village of Austria situated in the plain of the Marchfeld, 11½m. N.E. of Vienna. It gives its name to the battle of July 5 and 6, 1809, in which the French army under Napoleon defeated the Austrians commanded by the archduke Charles. On the failure of his previous attempt to pass his whole army across the Danube at Aspern (*see* NAPOLEONIC CAMPAIGNS and ASPERN), Napoleon set himself to concentrate around Vienna and the island of Lobau, not only his own field forces, but also every man, horse and gun available from Italy and South Germany for a final effort. Every detachment was drawn in within 48 hours' call, his rearward communications being practically denuded of their covering troops. The island of Lobau itself was converted practically into a fortress, and over 100 guns were mounted on its banks to command the Austrian side of the stream. Giving up, in face of this artillery, the direct defence of the river-side, the Austrians formed in a great arc of about 6m. radius extending from the Bisamberg, overlooking the Danube, in the west, to Markgrafneusiedl on the east. From this point to the Danube below Lobau a gap was left for the deployment of the archduke Johann's army from Pressburg 35m. distant. This army, however, arrived too late. Their total front, therefore, was about 12m. for 120,000 men, which could be reduced to about 6m. by a forward march of a couple of hours.

Meanwhile Napoleon replaced the temporary bridges over the main stream (*see* ASPERN) by two solid structures, protecting them by palisades of piles and floating booms, and organized an armed flotilla to command the waterway. On the island itself preparations were made to throw three bridges across the Lobau arm of the stream opposite Aspern and Essling, and seven more on the right, facing east between Gross Enzersdorf and the main river. For several days previous to the great battle the French had sent across small detachments, and hence when, on the afternoon of July 4, an advanced guard was put over near Gross Enzersdorf, the attention of the Austrians was not particularly attracted and they did not interfere. Under cover of this detachment Napoleon's pontoniers made the seven bridges. Long before daylight on the 5th the troops began to stream across, and about 9 A.M. the three corps destined for the first line (Davout, Oudinot and Masséna) had completed their deployment on a front of some 6,000yd. and were moving forward to make way for the second line (Eugene and Bernadotte) and the third line (Marmont, Bessières's cavalry and the guard). About noon the general advance began, the French opening outwards like a fan to obtain space for manoeuvre.

PLAN OF THE BATTLE OF WAGRAM, JULY 5–6, 1809

The Austrians held a strong position along the line of the Russbach from Deutsch Wagram to Markgrafneusiedl with their left, whilst their right was held ready for a counter-attack intended to roll up the French attack from left to right when the proper moment should come. The movements of the great French masses in the confined space were slow, and although the French left under Masséna pushed the Austrians back beyond Leopoldsau and Süssenbrunn, the main attack on the line of the Russbach did not declare itself till 8 P.M.; the corps did not attack simultaneously, and failed altogether to make any serious impression on the Austrian position. But, hearing of the success of his left wing on the Russbach, the archduke determined to anticipate the French next morning on that side, and four corps were directed upon Masséna, who had bivouacked his troops overnight on the line Leopoldsau-Süssenbrunn-Aderklaa, the latter, a strongly built village, forming, as it were, a bridge-head to the passages of the Russbach at Deutsch Wagram. Another corps with a strong cavalry force was also directed to pivot round Markgrafneusiedl and to attack Davout on his right; on this flank also the arrival of the archduke Johann was expected later in the day.

The Austrian movements were somewhat ill-connected; nevertheless, by 11 A.M. Masséna's detached left division had been driven back almost to Aspern, and his right, though aided by Bernadotte, had failed to recapture Aderklaa, from which the Austrians had driven his advanced posts early in the morning. The situation for the French looked serious, for their troops were not fighting with the dash and spirit of former years. But Napoleon was a master in the psychology of the battlefield, and knew that on the other side things were much the same. He therefore sent orders for a great counter-stroke. Davout on the right was to press his attack on Markgrafneusiedl and roll up the Austrian left flank; Oudinot, next him, was simply to engage the enemy on the heights with artillery fire for the time being. The capture of Markgrafneusiedl was to be the signal for the main blow against the Austrian centre by Eugene's two corps (under Macdonald and Grenier), which were then moving up. Meanwhile Masséna was to move laterally across the front to aid his isolated division in guarding the threatened left flank. The gap thus left was covered by a line of guns, soon raised to a total of 104, which prepared the advance of the V. Corps (Macdonald) through the gap on Süssenbrunn, followed by the guard and reserve cavalry.

Macdonald formed his 30,000 men in a gigantic hollow square —two lines, each of four deployed battalions, closed up so that the whole was six ranks deep, whilst the remainder of the infantry marched behind in column on either flank, and cavalry closed the rear. The Austrian round-shot cut swaths through this dense square—whose trail appeared one mass of dead and dying, creating a terrible impression on all who saw it. It had shrunk so much from losses, and still more from stragglers, that it came to a halt in a sandpit a mile short of Süssenbrunn. When reinforced, both directly and by divisions launched to attack Aderklaa and Breitenlee on its flanks, Macdonald resumed his advance and reached his objective. At the same time Napoleon had ordered forward Oudinot to cross the Russbach between Baumdorf and Wagram and to strike the joint of the Austrian line at Wagram. The Austrian left centre had been weakened by reinforcements sent to the left, hard pressed by Davout, and by stretching to cover the gap on the other side. This weakening enabled Oudinot to gain Wagram, while Davout had also made headway. With the penetration near Wagram, the Austrian army was split, and learning that the archduke Johann could not arrive until evening the archduke Charles at about 2.30 P.M. ordered a general retreat, the main part westward and the left wing northward.

The French had seen more of the slaughter than their adversaries, and except the emperor and Davout all seem to have been completely shaken. Even in Davout's command, always the steadiest in danger, the limit of endurance had been passed, for when about 5 P.M. the advanced patrols of the archduke Johann's force appeared on their flank, panic on a scale hitherto unknown in the

Grande Armée seized the right wing, and Napoleon had to confess that no further advance was possible for several days.

Berndt (*Zahl im Kriege*) gives the following figures: French 181,700 (including 29,000 cavalry) and 450 guns engaged, of whom 23,000 men were killed and wounded, 7,000 missing; Austrians, 128,600 (including 4,600 cavalry) and 410 guns engaged; losses, 19,110 killed and wounded, and 6,740 missing.

WAGTAIL, the popular name for birds of the subfamily *Motacillinae,* which, together with the *Anthinae* (*see* PIPIT), form the passerine family *Motacillidae.*

The pied wagtail is almost confined as a breeding species to the British Isles. It constitutes a good example of a species owing its origin to isolation. It is represented on the Continent by the white wagtail (*M. alba*), of which it is a sub-species. Three other species occur in England, but the subfamily with several genera and many species ranges over the Old World, except Australia and Polynesia, whilst Asiatic species reach North-west America.

Wagtails are long-tailed, generally parti-coloured birds, frequenting streams and stagnant water, and feeding on seeds, insects, worms, small molluscs, and crustaceans. The nests are made of moss, grass, and roots, with a lining of hair and feathers; four to six eggs are laid, bluish-white or brown, with yellow marks.

WAHHABI, the name of a Puritan movement within Islam. Wahhabis or *Ikhwan* (brothers), purport to follow in detail the practice of the Prophet, and regard as infidels all who do otherwise. Their enemies are the enemies of the true faith and their every campaign is therefore a *Jihad* (holy war), death in which is a sure passport to Paradise. Another feature of these communities is the complete elimination of all tribal distinctions. The old pastime of tribal raid and counter-raid is discountenanced. The blood-feud is no more. In the matter of doctrine the Wahhabis (*Ikhwan*) differ from their fellow Muslims in rejecting a large mass of tradition which they regard as un-authentic. Like all Muslims they regard the Koran (Quran) as the Word of God and therefore the foundation of their social code, but there is admittedly much in the Koran and much not in it which from the earliest days of Islam required explanation or consideration. Such matters were freely dealt with by the Prophet in conversation or in his practice, the records of which were subsequently collected in the form of "Traditions of the Prophet" which, being generally handed down by word of mouth, grew in volume as time progressed. (*See* ARABIA: *History.*)

WAHOO (*Euonymus atropurpureus*), a small North American tree of the staff-tree family (Celastraceae), known also as burning-bush, found from New York to Montana and southward and sometimes planted for ornament. The handsome fruit, ripening in October and persisting until midwinter, is a deeply lobed capsule with smooth purple valves which split apart at maturity, disclosing large seeds covered with a scarlet aril. (*See* CLIMBING BITTERSWEET; SPINDLE-TREE.)

WAIBLINGEN, a town of Germany, in the republic of Württemberg. Pop. (1925) 7,806. Waiblingen is mentioned in the 9th century, when it had a palace of the Carolingian sovereigns. Subsequently it belonged to the dukes of Franconia, and gave a surname to the emperor Conrad II. It was in this way that the Hohenstaufen family, which was descended in the female line from Conrad, received the name of Waiblingen, corrupted by the Italians into Ghibelline.

WAINEWRIGHT, THOMAS GRIFFITHS (1794–1852), English journalist and subject-painter, was born at Chiswick in October 1794. He contributed to various magazines and painted pictures some of which were exhibited at the Academy. Owing to his extravagant habits, Wainewright's affairs became deeply involved. In 1830 he insured the life of his sister-in-law in various offices for a sum of £18,000, and when she died, in the December of the same year, payment was refused by the companies on the ground of misrepresentation. Wainewright retired to France, was seized by the authorities as a suspected person, and imprisoned for six months. He had in his possession a quantity of strychnine, and it was afterwards found that he had destroyed, not only his sister-in-law, but also his uncle, his mother-in-law and a Norfolkshire friend, by this poison. He returned to London in 1837, but was at once arrested on a charge of forging, thirteen years before, a transfer of stock, and was sentenced to transportation for life. He died of apoplexy in Hobart Town hospital in 1852.

The *Essays and Criticisms* of Wainewright were published in 1880, with an account of his life, by W. Carew Hazlitt; and the history of his crimes suggested to Dickens his story of *Hunted Down* and to Bulwer Lytton his novel of *Lucretia.* His personality, as artist and poisoner, has interested latter-day writers, notably Oscar Wilde in "Pen, Pencil and Poison" (*Fortnightly Review,* Jan. 1889), and A. G. Allen, in T. Seccombe's *Twelve Bad Men* (1894).

WAITE, MORRISON REMICK (1816–1888), American jurist, was born at Lyme, Conn., on Nov. 29, 1816. He graduated at Yale in 1837, and soon afterwards removed to Maumee City, practised at Maumee City and at Toledo. In 1850 he removed to Toledo. In politics he was a Whig and later a Republican. In 1871, with William M. Evarts and Caleb Cushing, he represented the United States as counsel before the "Alabama" Tribunal at Geneva. In 1874 he was appointed chief-justice of the U.S. Supreme Court, and he held this position until his death. In the cases which grew out of the Civil War and reconstruction, and especially in those which involved the interpretation of the 13th, 14th and 15th amendments, he sympathized with the general tendency of the court to restrict the further extension of the powers of the Federal Government. He concurred with the majority in the Head Money Cases (1884), the Ku-Klux Case (*United States* v. *Harris,* 1882), the Civil Rights Cases (1883) and the *Juillard* v. *Greenman* (legal tender) Case (1883). He died in Washington, D.C., March 23, 1888.

WAITHMAN, ROBERT (1764–1833), lord mayor of London, born at Wrexham, was returned to parliament, as a Liberal, for the city of London in 1818. He lost his seat at the election of 1820, but regained it in 1826, and retained it till his death, taking part vigorously in the parliamentary debates, and strenuously supporting reform. In 1823 he was lord mayor of London. Waithman died in London on Feb. 6, 1833.

WAITS, the itinerant musicians who parade the streets at night at Christmas time (A.S. *wacan,* to "wake" or "watch"). The waits of the 14th and 15th centuries were watchmen who sounded horns or even played a tune to mark the hours. The book of household expenses of Edward IV. (1478) provides for "a wayte, that nyghtely from Mychelmas to Shreve Thorsdaye pipe the watch within this courte fowere tymes; in the somere nightes three tymes." Elaborate orders as to his housing occur. During his actual attendance at court he was to receive 4½d. a day or less in the discretion of the steward of the household. He had a livery given him and during illness an extra allowance of food. Besides "piping the watch" and guarding the palace against thieves and fire, this wait had to attend at the installation of knights of the Bath. London and all the chief boroughs had their corporation waits from the early 16th century. In 1582 Dudley, earl of Leicester, writes to the corporation of London asking that a servant of his should be admitted to the city waits. The London waits played before the mayor during his annual progress through the streets and at city dinners, and had a uniform of blue gowns with red sleeves and caps with silver collars or chains round the neck. In the 18th and early 19th century the ordinary street watchman serenaded householders at Christmas time, calling round on Boxing Day to receive a gratuity for their tunefulness. When in 1829 their place as guardians of the city's safety was taken by police, private individuals kept up the custom.

WAKATSUKI, REIJIRO (1866–), Japanese statesman, graduated in law at the Imperial university of Tokyo in 1892, when he also entered the civil service. He was nominated crown member of the house of peers in 1911, and was minister of finance in 1912 and in 1914–1915, and also minister of home affairs in 1924–1926. He succeeded Viscount Kato as prime minister and leader of the Kensei-kwai party in 1926. He desired to broaden the basis of his cabinet by including members of the Seiyuhonto

party, but failed, and was compelled to reconstitute his ministry (June 1926), exclusively with members of the Kensei-kwai party. Later on, he succeeded in obtaining the support of the Seiyuhonto party, thus securing a majority in the Chamber. During the autumn of 1926 proceedings against students accused of communism caused considerable unrest. Some of them had been arrested in December 1925, but no information on the subject had appeared in the press until September. But the real cause of his fall on April 16, 1927, was the failure of the Suzuki firm. Later, the Kensei-kwai and Seiyuhonto united to establish a new party, Minseito, on June 1, 1927. Wakatsuki transferred the leadership to Hamaguchi, co-operating with Tokonami, the leader of Seiyuhonto.

WAKE, "waking" or watching round a corpse before burial (A.S. *wacan,* to "wake" or "watch"); in the wider sense a vigil kept in commemoration of the dedication of the parish church. This religious wake consisted in an all-night service of prayer and meditation in the church. These services, officially termed *Vigiliae* by the church, appear to have existed from the earliest days of Anglo-Saxon Christianity. Each parish kept the morrow of its vigil as a holiday. Wakes soon degenerated into fairs; people from neighbouring parishes journeyed over to join in the merry-making, and the revelry and drunkenness became a scandal. The days usually chosen for church dedications being Sundays and Saints' days the abuse was the more scandalous. In 1445 Henry VI. attempted to suppress markets and fairs on Sundays and holy days. Wakes are specially mentioned in the *Book of Sports* of James I. and Charles I.

Side by side with these church wakes there existed the custom of "waking" a corpse. The custom, as far as England was concerned, seems to have been older than Christianity, and to have been at first essentially Celtic. Doubtless it had a superstitious origin, the fear of evil spirits hurting or even removing the body. The Anglo-Saxons called the custom lich-wake or like-wake (A.S. *lic,* a corpse). With the introduction of Christianity the offering of prayer was added to the vigil. As a rule the corpse, with a plate of salt on its breast, was placed under the table, on which was liquor for the watchers. These private wakes soon tended to become drinking orgies. With the Reformation and the consequent disuse of prayers for the dead the custom of "waking" became obsolete in England, but survived in Ireland. Many countries and peoples have a custom equivalent to "waking," which, however, is distinct from the funeral feasts pure and simple.

For detailed accounts of Irish wakes *see* Brand's *Antiquities of Great Britain* (W. C. Hazlitt's edition, 1905) under "Irish Wakes."

WAKEFIELD, EDWARD GIBBON (1796–1862), British colonial statesman, was born in London on March 20, 1796, of an originally Quaker family. His father, Edward Wakefield (1774–1854), author of *Ireland, Statistical and Political* (1812), was a surveyor and land agent in extensive practice; his grandmother, Priscilla Wakefield (1751–1832), was a popular author for the young, and one of the introducers of savings banks. Wakefield was for a short time at Westminster school, and was brought up to his father's profession, but he eloped at 20 with Miss Pattle, the orphan daughter of an Indian civil servant. Her relatives became reconciled to the match, and procured him an appointment as attaché to the British legation at Turin. He resigned this post in 1820, upon the death of his wife, and then spent some years in Paris. In 1826 he decoyed Ellen Turner from school by means of a forged letter, by which she was induced to believe that she could only save her father from ruin by marrying Wakefield, whom she accordingly accompanied to Gretna Green. He was tried with his confederates at Lancaster assizes, March 1827, convicted, and sentenced to three years' imprisonment in Newgate. The marriage, which had not been consummated, was dissolved by a special act of parliament.

Wakefield turned his attention while in prison to colonial subjects, and acutely detected the main causes of the slow progress of the Australian colonies in the enormous size of the landed estates, and the reckless methods of allocation of land. He proposed the sale of land in small quantities at a sufficient price, and the employment of the proceeds as a fund for promoting immigration. These views were expressed with extraordinary vigour in his *Letter from Sydney* (1829), published while he was still in prison, but composed with such graphic power that it has been continually quoted as if written on the spot. After his release Wakefield produced a tract on the *Punishment of Death,* with a terribly graphic picture of the condemned felons in Newgate, and another on incendiarism in the rural districts, with an equally powerful exhibition of the degraded condition of the agricultural labourer.

He soon, however, became entirely engrossed with colonial affairs, and, having impressed John Stuart Mill, Colonel Torrens (*q.v.*) and other leading economists with the value of his ideas, became a manager of the South Australian Company, by which the colony of South Australia was ultimately founded. In 1833 he published anonymously *England and America,* a work primarily intended to develop his own colonial theory, which is done in the appendix entitled "The Art of Colonization." The body of the work, however, is fruitful in seminal ideas, though some statements may be rash and some conclusions extravagant. It contains the proposal that the transport of letters should be wholly gratuitous—the precursor of subsequent reform—and the prophecy that, under given circumstances, "the Americans would raise cheaper corn than has ever been raised." In 1836 Wakefield published a volume of an uncompleted edition of Adam Smith.

Colonization of New Zealand.—In 1837 the New Zealand Association was established, and he became its managing director. Scarcely, however, was this great undertaking fairly commenced when he accepted the post of private secretary to Lord Durham on the latter's appointment as special commissioner to Canada. The Durham Report, the charter of constitutional government in the colonies, though drawn up by Charles Buller, embodied the ideas of Wakefield, and the latter was the means of its being given prematurely to the public through *The Times,* to prevent its being tampered with by the Government. He acted in the same spirit a few months later, when (about July 1839), understanding that the authorities intended to prevent the despatch of emigrants to New Zealand, he hurried them off on his own responsibility, thus compelling the Government to annex the country just in time to anticipate a similar step on the part of France. (*See* NEW ZEALAND: *History.*) In 1846 Wakefield, exhausted with labour, was struck down by apoplexy, and spent more than a year in complete retirement, writing during his gradual recovery his *Art of Colonization.*

The management of the company had meanwhile passed into the hands of others, whose sole object was to settle accounts with the Government, and wind up the undertaking. Wakefield seceded, and joined Lord Lyttelton and John Robert Godley in establishing the Canterbury settlement as a Church of England colony. A portion of his correspondence on this subject was published by his son as *The Founders of Canterbury* (Christchurch, 1868). In 1854 he appeared in the first New Zealand parliament as extra-official adviser of the acting governor, a position which excited great jealousy, and as the mover of a resolution demanding the appointment of a responsible ministry. In that year Wakefield's health broke down. He spent the rest of his life in retirement, dying at Wellington on May 16, 1862.

Wakefield was a man of large views and lofty aims, and in private life displayed the warmth of heart which commonly accompanies these qualities. But he hesitated at nothing necessary to accomplish an object, and the conviction of his untrustworthiness gradually alienated his associates, and left him politically powerless. Excluded from parliament by the fatal error of his youth, he was compelled to resort to indirect means of working out his plans by influencing public men. But for a tendency to paradox, his intellectual powers were of the highest order, and as a master of nervous English he rivals Cobbett.

For an impartial examination of the Wakefield system, *see* Leroy-Beaulieu, *De la colonisation chez les peuples modernes* (3rd ed. pp. 562–575 and 696–700). *See* also R. Garnett's *Life of Wakefield* (1898); and R. C. Mills, *The Colonisation of Australia; 1829–42; the Wakefield experiment in empire building* (1915).

WAKEFIELD, a city in Yorkshire, England. Pop. (1921) 52,891. It lies on the river Calder at the eastern edge of the Pen-

nines and developed as a market at the meeting place of the lowlanders with the people of the dales. It was also at the first easy crossing place in flood time before the age of bridges and good roads. It is now a focus of rail and road routes from all parts of Yorkshire and is connected with Leeds, Goole and Hull by the Aire and Calder Navigation, with towns to the west of the city and with Lancashire by the Calder and Hebble Navigation, and with Barnsley and the Dearne valley by canal. It is the headquarters of the county council of the West Riding.

Wakefield (Wachefeld) was the chief place in a large estate belonging to King Edward the Confessor, and was still a royal manor in 1086 at the time of the Domesday survey. Shortly afterwards it became an extensive baronial liberty extending into the confines of Lancashire and Cheshire. In 1203–04, the lord of the manor received a grant of a three-days fair at Wakefield, and as early as 1231 the town seems to have had some form of burghal organization. In 1331 the king granted the inhabitants pavage there for three years and another annual fair of three days duration. There is no other indication of a borough. An ancient church existed on the site of the present cathedral church, but only slight traces remain of buildings previous to the 14th century. In the early part of that century the church was almost rebuilt and it was consecrated in 1329. Further great alterations took place in the 15th century and the general effect of the building as it stands is perpendicular. A new stone bridge was erected over the river in 1343, though a bridge had probably existed long before this date. The river is also crossed by a fine bridge of eight arches on which stands the chapel of St. Mary, built in the richest Decorated style. Its endowment is attributed to Edward IV., in memory of his father Richard, duke of York, who fell in the battle of Wakefield, in 1460, but both bridge and chapel existed before the middle of the 14th century, a licence for the chapel being obtained in 1357. It was completely restored in 1847. The town was attacked and taken by Fairfax in 1643, but Sandal castle, an extensive stronghold to the south of the river remained in the hands of the Royalists for another 12 months, when it was besieged and taken; it was dismantled in 1648.

About 1470, foreign cloth-weavers, chiefly Flemings, began to settle, and by 1500, Wakefield was the centre of the district. During the 18th century it became noted for the manufacture of woollen stuffs, and the Cloth Hall was opened in 1710, but in the 19th century it was superseded by Leeds. Today, it possesses mills for spinning worsted and carpet yarns, coco-nut fibre and China grass. It has also rag-crushing mills for the manufacture of "shoddy," chemical works, soap-works and iron industries of various kinds, including wire-drawing, engineering and machine tool works, making of sheet metal working machinery and colliery machinery, and boiler making. A number of collieries exist in the neighbourhood.

Wakefield is the chief agricultural town in the West Riding and its corn market is of remote origin. The cattle market held under charter of 1765, is not less important. The town possesses agricultural implement and machine works, grain and flour mills, malt-works and breweries.

Down to 1832, Wakefield was under the superintendence of a constable appointed by the steward of the lord of the manor, but in that year, the town was enfranchised and now the borough returns one member. In 1848 a charter of incorporation was granted and in 1888 the town was created a city. In the same year the Bishopric of Wakefield was formed, almost entirely from that of Ripon. The diocese includes about one-seventh of the parishes of Yorkshire and covers a small portion of Lancashire. The parish church of All Saints became the cathedral and was enlarged in 1900 by the construction of the retrochoir. During the restoration of the spire in 1905, records of previous work were discovered in a sealed receptacle in the weather-vane. The Elizabethan grammar school was founded in 1592.

WAKEFIELD, a town of Middlesex county, Massachusetts, 10 m. N. of Boston. Pop. (1920) 13,025 (25% foreign-born white); 1928 local estimate 16,000. The town park (25 ac.), shaded by fine old elms, extends to Lake Quannapowitt, and opposite are Crystal lake and Hart's hill, a park of 30 acres. Rattan and willow furniture are made. The first settlement here was made in 1639. In 1812 the southern parish of Reading (which was strongly Democratic-Republican, while the rest of Reading was strongly Federalist) was set off and incorporated as the town of South Reading, and in 1868 the present name was adopted in honour of Cyrus Wakefield (1811–73), who established the rattan works and gave the town its town hall.

WAKEFIELD ESTATE, the birthplace of George Washington, in Westmoreland county, Va., was settled in 1656 by Col. John Washington, great-grandfather of George Washington. It was held continuously by the Washington family until 1812 and a part of it has since continued in the hands of descendants. George Washington lived there for four years and then moved with his parents to their estate at Mt. Vernon. The house in which he was born was burned in 1780, but the Wakefield National Memorial Association, which has purchased part of the estate, proposes to rebuild and refurnish it for the bi-centenary of his birth in 1932.

WAKE-ROBIN: *see* TRILLIUM.

WAKLEY, THOMAS (1795–1862), English medical and social reformer, was born at Membury in Devonshire on July 11, 1795. After qualifying as a surgeon he set up in practice in London, and in 1823 started the well-known medical weekly paper, the *Lancet,* in which he exposed the jobbery and other malpractices among the practitioners of the day, who were accustomed to treat the medical profession as a close borough. This attack he carried still further against the whole constitution of the Royal College of Surgeons. In 1827 a petition to parliament resulted in a return being ordered of the public money granted to it. But reform was slow, and Wakley now set himself to rouse the House of Commons from within. He was a friend of William Cobbett, and in 1835 was returned to parliament as Radical member for Finsbury, retaining his seat till 1852. He died on May 16, 1862, the *Lancet* remaining in the family.

See S. S. Sprigge, *Life and Times of Thomas Wakley* (1897).

WALACHIA or **WALLACHIA,** a former principality of south-eastern Europe, constituting after its union with Moldavia on the 9th of November 1859, a part of Rumania (*q.v.*).

WALAFRID STRABO (or Strabus, *i.e.,* "squint-eyed") (d. 849), German monk and theological writer, was born about 808 in Swabia. He was educated at the monastery of Reichenau, near Constance, where he had for his teachers Tatto and Wettin, to whose visions he devotes one of his poems. Then he went on to Fulda, where he studied for some time under Hrabanus Maurus before returning to Reichenau, of which monastery he was made abbot in 838. There is a story—based, however, on no good evidence—that Walafrid devoted himself so closely to letters as to neglect the duties of his office, owing to which he was expelled from his house; but, from his own verses, it seems that the real cause of his flight to Spires was that he espoused the side of Lothair (*q.v.*) on the death of Louis the Pious in 840. He was, however, restored to his monastery in 842, and died on Aug. 18, 849, on an embassy to his former pupil, Charles the Bald.

Works.—Of his theological works the most famous is the exegetical compilation which, under the name of *Glosa ordinaria* or the *Glosa,* remained for some 500 years the most widespread and important quarry of mediaeval biblical science, and even survived the Reformation, passing into numerous editions as late as the 17th century. (See *Hist. littéraire de la France,* t. v. p. 59 ff.) The oldest known copy, in four folio volumes, is almost entirely Walafrid's work and gives us his method. In the middle of the pages is the Latin text of the Bible; in the margins are the "glosses," consisting of a very full collection of patristic excerpts in illustration and explanation of the text. An *Expositio quatuor Evangeliorum is* also ascribed to Walafrid.

Of interest also is his *De exordiis et incrementis rerum ecclesiasticarum,* written between 840 and 842. It deals with ecclesiastical usages, churches, altars, prayers, bells, pictures, baptism and the Holy Communion. Walafrid shows no trace of belief in transubstantiation as taught by his famous contemporary Radbertus (*q.v.*).

Walafrid's chief historical works are the rhymed *Vita sancti Galli* and a much shorter life of St. Othmar, abbot of St. Gall (d. 759). A critical edition of them by E. Dummler is in the

Monumenta Germaniae hist. Poëtae Latini, ii. (1884), p. 259 ff. Walafrid's poetical works also include a short life of St. Blaithmaic, a high-born monk of Iona, murdered by the Danes in the first half of the 9th century; a life of St. Mammas; and a *Liber de visionibus Wettini.* Many of Walafrid's other poems are, or include, short addresses to kings and queens (Lothair, Charles, Louis, Pippin, Judith, etc.) and to friends (Einhard, Grimald, Hrabanus Maurus, Tatto, Ebbo, archbishop of Reims, Drogo, bishop of Metz, etc.).

His most famous poem is the *Hortulus,* dedicated to Grimald. It is an account of a little garden that he used to tend with his own hands, and is largely made up of descriptions of the various herbs he grows there and their medicinal and other uses. Sage holds the place of honour; then comes rue, the antidote of poisons; and so on through melons, fennel, lilies, poppies and many other plants, to wind up with the rose, "which in virtue and scent surpasses all other herbs, and may rightly be called the flower of flowers." The poem *De Imagine Tetrici* was inspired by an equestrian statue of Theodoric the Great which stood in front of Charlemagne's palace at Aix-la-Chapelle.

For a bibliography of Walafrid's historical works, and of writings dealing with them, *see* Potthast, *Bibliotheca hist. med. aevi* (Berlin, 1894), p. 1102 ff. Walafrid's works are published in Migne's *Patrologia Latina,* vols. cxiii. and cxiv. For further references *see* the article by Eduard Reuss and A. Hauck in Herzog-Hauck, *Realencyklopädie* (Leipzig, 1908), xx. 790.

WALCOTT, CHARLES DOOLITTLE (1850–1927), American palaeontologist, born in New York Mills, N.Y., Mar. 31, 1850. To his education in the public schools and Utica Academy he added special reading and study of his own in geology, and in 1876 became an assistant to James Hall, New York State geologist and eminent palaeontologist. Three years later he joined the newly organized U.S. Geological Survey as assistant geologist. He became director of the U.S. Geological Survey in 1894 and in the next few years reorganized it and greatly extended its usefulness. During the 13 years of his control the Reclamation Service, the Forestry Service and the Bureau of Mines were all founded as branches of the Geological Survey, Walcott drawing up the legislative enactments which created the first two, and shaping the organization of all of them. He was appointed secretary of the Smithsonian Institution in 1907 in which capacity he served 20 years (1907–27), directing its researches and broadening its scope. He secured the addition of the Freer and National art galleries as part of the greater institution. He was one of the founders of the Carnegie Institute, its first secretary and administrative officer, 1902–05, and a member of the executive committee until his death. He was also active in the organization of the Federal Research Council, serving afterwards as a member of the executive committee. He was responsible for the establishment of the National Advisory Committee for Aeronautics and was its chairman until his death.

His chief contribution to science lies in his full description and interpretation of the early Cambrian and Algonkian fauna. With Arnold Hague he surveyed and worked out the great Paleozoic region of central Nevada. He examined the Cambrian formation of the Appalachian belt and eastward, and began a determination of the Cambrian and pre-Cambrian rocks of the Western States. Almost every summer after 1907 he devoted to unearthing the Cambrian succession in the Rocky Mountains of Canada, where it is unusually complete. In 1910 he discovered the remarkable Burgess deposit of Cambrian fossils in British Columbia, the finest invertebrate fossil field yet known.

He published a series of 38 octavo volumes on Cambrian geology and palaeontology and two volumes on *Cambrian Brachiopoda* (1912), besides about 300 scientific papers. See *Smithsonian Miscellaneous Collections,* vol. 80 (1928) for complete bibliography and memoir.

WALD, LILLIAN D. (1867–), American sociologist, was born at Cincinnati (O.) on March 10, 1867. She graduated from the New York Hospital training school for nurses. In 1893 she founded the Henry Street Settlement, now internationally known, and organized the district nursing work in connection with it. The first municipalization of school nursing anywhere was due to her when she originated the work of the school nurse in New York in 1902. The idea of the Federal Children's Bureau which passed commissions of both houses of Congress, 1908, was also hers, as well as the foundation of what is known as "public health nursing" in the United States following Florence Nightingale's conception of "health nursing." She served the cause of public welfare on several national and international commissions and conferences, notably in the 1919 series at Cannes, Zürich and Washington; was chairman of the American Union against Militarism; one of the organizers of the National Women's Trade Union League; represented the public from 1910 on the joint board of sanitary control of certain trades, and was author of *The House on Henry Street* and other writings.

WALDECK, a State of the German Republic, between Westphalia and Hesse-Nassau. It has an area of 433 sq.m., covered with hills, which culminate in the Hegekopf (2,775 ft.). The centre is the plateau of Corbach. The chief rivers are the Eder and the Diemel, flowing into the Weser. The population in 1925 was 58,641, an average of 135 persons to the square mile. It is almost wholly Protestant. The lowest area is 540 ft. above the sea-level—the climate is inclement. The soil is nowhere fertile. Oats is the principal crop, but rye, potatoes and flax are also grown, and fruit cultivated. There are mines, slate and stone quarries. Manufactures are retarded by isolation from railways.

The capital is Arolsen (pop. 3,000 in 1925). Wildungen is a spa of repute. The inhabitants to the north of the Eder are of Saxon stock, to the south of Franconian, a difference which is distinctly marked in dialect, costumes and manners.

The provisional Constitution of Waldeck dates from April 15, 1919. The diet consists of 17 members. The republic is governed by Prussia, in accordance with the treaty of 1867, which has lately been denounced on the side of Prussia.

For former political conditions *see* Curtze, *Geschichte und Beschreibung des Fürstentums Waldeck* (Arolsen, 1850); Löwe, *Heimatskunde von Waldeck* (Arolsen, 1887); J. C. C. Hoffmeister, *Historisch-genealogisches Handbuch über alle Grafen und Fürsten von Waldeck seit 1228* (Cassel, 1883); Böttcher, *Das Staatsrecht des Fürstentums Waldeck* (Freiburg, 1884); A. Wagner, *Die Geschichte Waldecks und Pyrmonts* (Wildungen, 1888), and the *Geschichtsblätter für Waldeck und Pyrmont* (Mengeringhausen, 1901, fol.).

WALDECK-ROUSSEAU, PIERRE MARIE RENÉ ERNEST (1846–1904), French statesman, was born at Nantes on Dec. 2, 1846. He studied law at Poitiers and in Paris and joined the bar of St. Nazaire. In 1873 he removed to Rennes, and six years later was returned to the Chamber of Deputies, where he supported the policy of Gambetta. He made his reputation in the Chamber by a report which he drew up in 1880 for the committee appointed to inquire into the French judicial system. He had a large share in 1884 in securing the recognition of trade unions.

In 1881 he became minister of the interior in Gambetta's *grand ministère,* and he held the same portfolio in the Jules Ferry cabinet of 1883–1885, when he sought to put down the system by which civil posts were obtained through the local deputy, and he made it clear that the central authority could not be defied by local officials. He had begun to practise at the Paris bar in 1886, and in 1889 he did not seek re-election to the Chamber, but devoted himself to his legal work. The most famous of the many noteworthy cases in which his cold and penetrating intellect and his power of clear exposition were retained was the defence of M. de Lesseps in 1893. In 1894 he returned to political life as senator for the department of the Loire, and next year stood for the presidency of the republic against Félix Faure and Henri Brisson, being supported by the Conservatives, who were soon to be his bitter enemies. He received 184 votes, but retired before the second ballot to allow Faure to receive an absolute majority.

During the political anarchy of the next few years he was recognized by the moderate republicans as the successor of Jules Ferry and Gambetta, and at the crisis of 1899 on the fall of the Dupuy cabinet he was asked by President Loubet to form a government. He formed a coalition cabinet which included M. Millerand and General de Galliffet. He himself took the ministry of the interior, and set to work to quell the discontent with which the country was seething, to put an end to the various agitations against republican institutions, and to restore independence to the

judicial authority. His efforts enabled the government to leave the second court-martial of Captain Dreyfus at Rennes an absolutely free hand, and then to compromise the affair by granting a pardon to Dreyfus. Waldeck-Rousseau won a great personal success in October by his successful intervention in the strikes at Le Creusot. With the condemnation in January 1900 of Paul Déroulède and his monarchist and nationalist followers by the High Court the worst of the danger was past, and Waldeck-Rousseau kept order in Paris without having recourse to irritating displays of force. The Senate was staunch in support of M. Waldeck-Rousseau, and in the Chamber he displayed remarkable astuteness in winning support from various groups. The Amnesty Bill, passed on Dec. 19, chiefly through his unwearied advocacy, alleviated bitterness.

But the most important measure of his later administration was the Associations Bill of 1901. The royalist bias given to the pupils in the religious seminaries was undoubtedly a principal cause of the passing of this bill. His speeches on the religious question were published in 1901 under the title of *Associations et congrégations,* following a volume of speeches on *Questions sociales* (1900). With the defeat, at the general election of 1902, of the machinations against the republic M. Waldeck-Rousseau considered his task ended, and on June 3, 1902, he resigned office, having proved himself the "strongest personality in French politics since the death of Gambetta." He emerged from his retirement to protest in the Senate against the construction put on his Associations Bill by M. Combes, who refused in mass the applications of the teaching and preaching congregations for official recognition. He died on Aug. 10, 1904.

His speeches were published as *Discours parlementaires* (1889); *Pour la république, 1883–1903* (1904), edited by H. Leyret; *L'État et la liberté* (1906); and his *Plaidoyers* (1906, etc.) were edited by H. Barboux. *See* also H. Leyret, *Waldeck-Rousseau et la troisième république* (1908), and the article FRANCE: *History.*

WALDEN, PAUL (1863–), Russian chemist, was born at Livland on July 14 (O.S.), 1863; he studied at Riga, Leipzig and Munich. In 1885 he was appointed assistant in the physics department of the Riga polytechnic, and he successively held the posts of assistant in chemistry (1888), *dozent* (1892), professor of analytical and physical chemistry (1894) and ordinary professor of inorganic and physical chemistry (1896); in addition in 1902 he was made director of the polytechnic. In 1910 he was appointed director of the chemistry department of the science academy at St. Petersburg (Leningrad), then in 1918 was made professor at the new German *Hochschüle* in Riga, and finally in 1919 he became professor and director of the chemistry institute of the University of Rostock.

Walden is probably best known for the curious reaction known as the "Walden inversion" which he discovered in 1895. (*See* CHEMISTRY, ORGANIC.) An optically active compound generally yields a compound of the same sign as a result of a chemical change, but Walden discovered exceptions to this rule; further instances have since been brought to light. His other important work is on the electrical conductivity of aqueous solutions of organic acids and a comprehensive study of the conductance of non-aqueous solutions, with particular reference to viscosity. His more recent work deals with dielectric constants and other electrical properties of solutions. He has written *Das Leitvermögen der Lösungen* and *Elektrochemie nichtwässeriger Lösungen.*

WALDENBURG, a town in Silesia. Pop. (1925) 44,023. Waldenburg, which became a town in 1426, lies in the centre of the productive coal district of the Waldenburger Gebirge, a branch of the Sudetic chain. Among other industrial establishments are machine, brick, wire, furniture, porcelain and earthenware factories and a china-painting establishment; there are also numerous flax-spinneries and linen-factories in the neighbourhood. To the south is the village of Oberwaldenburg, pop. (1925) 4,546, with a château and some coal mines.

WALDENSES. The Waldensian valleys lie to the south-west of Turin, in the direction of Monte Viso, being fertile and well wooded. The principal town near the valleys is Pinerolo (Pignerol). Just to its south-west there opens the chief Waldensian valley, the Val Pellice, watered by the stream of that name, with the capital, Torre Pellice.

SECTS OF THE MIDDLE AGES

The name Waldenses was given to the members of an heretical Christian sect which arose in the south of France about 1170. The history of the sects of the middle ages is obscure, because the earliest accounts of them come from those who were concerned in their suppression. Later apologists of each sect reversed the process. In early times these sectaries produced little literature of their own; when they produced a literature at the beginning of the 15th century they attempted to claim for it a much earlier origin. Hence there is confusion on every side. The polemical conception which has done much to perpetuate this confusion is that of the historical continuity of Protestantism from the earliest times. According to this view the church was pure and uncorrupt till the time of Constantine, when Pope Sylvester gained the first temporal possession for the papacy, and so began the system of a rich, powerful and worldly church, with Rome for its capital. Against this secularized church a body of witnesses silently protested; they were always persecuted but always survived, till in the 13th century a desperate attempt was made by Innocent III. to root them out from their stronghold in southern France. Persecution gave new vitality to their doctrines, which passed on to Wycliffe and Huss, and through these leaders produced the Reformation in Germany and England.

But, so far as can now be discovered the heretical sects of the middle ages rested upon a system resembling Manichaeism which was imported into Europe from the East. (*See* MANICHAEISM.) The Manichaean system of dualism, with its severe asceticism, and its individualism, which early passed into antinomianism, was attractive to many minds in the awakening of the 11th century. Its presence in Europe can be traced in Bulgaria soon after its conversion in 862, where the struggle between the Eastern and Western churches for the new converts opened a way for the more hardy speculations of a system which had never entirely disappeared, and found a home amongst the Paulicians (*q.v.*) in Armenia. The name of Cathari (*see* CATHARS), taken by the adherents of this new teaching, sufficiently shows the Oriental origin of their opinions, which spread from Bulgaria amongst the Slavs, and followed the routes of commerce into central Europe. The earliest record of their presence there is the condemnation of ten canons of Orleans as Manichees in 1022, and soon after this we find complaints of the prevalence of heresy in northern Italy and in Germany. The strongholds of these heretical opinions were the great towns, the centres of civilization, because there the growing sentiment of municipal independence, and the rise of a burgher class through commerce, created a spirit of criticism directed against the worldly lives of the clergy.

The system of Catharism recognized two classes of adherents, *credentes* and *perfecti.* The *perfecti* only were admitted to its esoteric doctrines and to its superstitious practices. To the ordinary men it seemed to be a reforming agency, insisting on a high moral standard, and upholding the words of Scripture against the traditions of an overgrown and worldly church. It may be said generally that Catharism formed the abiding background of mediaeval heresy. Prevailing discontent, in conflict with authority generally ended by borrowing something from Catharism. The result was that in the beginning of the 13th century there was a tendency to class all bodies of heretics together.

WALDENSIAN SECT

Most of these sects were stamped out before the period of the middle ages came to a close. The Waldenses, under their more modern name of the Vaudois, survived into the 19th century in the valleys of Piedmont, and have been regarded as at once the most ancient and the most evangelical of the mediaeval sects. It is, however, by no means easy to determine their original tenets, as in the 13th and 14th centuries they were a body of obscure and unlettered peasants, hiding themselves in a corner, while in the 16th century they were merged in the Reformation.

Already in the 9th century there were many protests against the rigidity and want of spirituality of a purely sacerdotal church. Thus Berengar of Tours (999–1088) upheld the symbolic character of the Eucharist and the superiority of the Bible over

tradition. The Paterines in Milan (1045) raised a protest against simony and other abuses of the clergy, and Pope Gregory VII. did not hesitate to enlist their Puritanism on the side of the papacy and make them his allies in imposing clerical celibacy. In France, at Embrun, Peter de Bruys founded a sect known as Petrobrusians, who denied infant baptism, the need of consecrated churches, transubstantiation, and masses for the dead. A follower of his, a monk, Henry, gave the name to another body known as Henricians, who centred in Tours. The teachers of these new opinions were men of high character and holy lives, who in spite of persecution wandered from place to place, and made many converts from those who were dissatisfied at the want of clerical discipline which followed upon the struggle for temporal supremacy into which the reforming projects of Gregory VII. had carried the church.

It was at this time (1170) that a rich merchant of Lyons, Peter Waldo, sold his goods and gave them to the poor; then he went forth as a preacher of voluntary poverty. His followers, the Waldenses, or poor men of Lyons, were moved by a religious feeling which could find no satisfaction within the actual system of the church, as they saw it before them. Like St. Francis, Waldo adopted a life of poverty that he might be free to preach. He had a translation of the New Testament made into Provençal, and his preachers explained the Scriptures. Pope Alexander III., who had approved of the poverty of the Waldensians, prohibited them from preaching without the permission of the bishops (1179). Waldo answered that he must obey God rather than man. He was excommunicated by Lucius III. in 1184.

DIVISIONS OF WALDENSIAN BELIEF

The earliest definite account given of Waldensian beliefs is that of the inquisitor Sacconi about 1250. (D'Argentré, *Collectio judiciorum de novis erroribus*, i. 50, etc.) He divides them into two classes; those north of the Alps and those of Lombardy. The first class hold (1) that oaths are forbidden by the gospel, (2) that capital punishment is not allowed to the civil power, (3) that any layman may consecrate the sacrament of the altar, and (4) that the Roman Church is not the Church of Christ. The Lombard sect went farther in (3) and (4), holding that no one in mortal sin could consecrate the sacrament, and that the Roman Church was the scarlet woman of the Apocalypse, whose precepts ought not to be obeyed, especially those appointing fast-days. This account sufficiently shows the difference of the Waldenses from the Cathari: they were opposed to asceticism and had no official priesthood; at the same time their objection to oaths and to capital punishment are closely related to the principles of the Cathari.

These opinions were subversive of the system of the mediaeval church, and were viewed with disfavour by its officials. The earliest known document proceeding from the Waldensians is an account of a conference held at Bergamo in 1218 between the ultramontane and the Lombard divisions, in which the Lombards showed a greater opposition to the recognized priesthood than did their northern brethren. (Preger, *Beiträge zur Geschichte der Waldensier.*)

ATTEMPTS AT SUPPRESSION

The spread of these heretical sects led to resolute attempts at their suppression. The crusade against the Albigensians could destroy prosperous cities and hand over lands from a heedless lord to one who was obedient to the church; but it could not get rid of heresy. The revival of preaching, which was the work of the order of St. Dominic, did more to combat heresy, especially where its persuasions were enforced by law. The work of inquisition into cases of heresy proceeded slowly in the hands of the bishops, who were too busy with other matters to find much time for sitting in judgment on theological points about which they were imperfectly informed. The greatest blow struck against heresy was the transference of the duty of inquiry into heresy from the bishops to Dominican inquisitors. The secular power, which shared in the proceeds of the confiscation of those who were found guilty of heresy, was ready to help in carrying out the judgments of the spiritual courts. Everywhere, and especially in the district round Toulouse, heretics were keenly prosecuted, and before the continued zeal of persecution the Waldenses slowly disappeared from the chief centres of population and took refuge in the retired valleys of the Alps. There, in the recesses of Piedmont, where the streams of the Pelice, the Angrogne, the Clusone and others cleave the sides of the Alps into valleys which converge at Susa, a settlement of the Waldensians was made who gave their name to these valleys of the Vaudois. In the more accessible regions north and south heresy was exposed to a steady process of persecution, and tended to assume shifting forms. Among the valleys it was less easily reached, and retained its old organization and its old contents. Little settlements of heretics dispersed throughout Italy and Provence looked to the valleys as a place of refuge, and tacitly regarded them as the centre of their faith. At times attempts were made to suppress the sect of the Vaudois, but the nature of the country which they inhabited, their obscurity and their isolation made the difficulties of their suppression greater than the advantages to be gained from it. However, in 1487 Innocent VIII. issued a bull for their extermination, and Alberto de' Capitanei, archdeacon of Cremona, put himself at the head of a crusade against them. Attacked in Dauphiné and Piedmont at the same time, the Vaudois were hard pressed; but luckily their enemies were encircled by a fog when marching upon their chief refuge in the valley of the Angrogne, and were repulsed with great loss. After this Charles II., duke of Piedmont, interfered to save his territories from further confusion, and promised the Vaudois peace. They were, however, sorely reduced by the onslaught. Scattered bodies of Waldenses in Germany influenced, and afterwards joined, the Hussites and the Bohemian Brethren.

The last step in the development of the Waldensian body was taken in 1530, when two deputies of the Vaudois in Dauphiné and Provence, Georges Morel and Pierre Masson, were sent to confer with the German and Swiss Reformers. A letter addressed to Oecolampadius gives an account of their practices and beliefs at that time, and shows us a simple and unlettered community, which was the survival of an attempt to form an esoteric religious society within the mediaeval church. It would appear that its members received the sacraments of baptism and the holy communion from the regular priesthood, at all events sometimes, but maintained a discipline of their own and held services for their own edification, largely dependent on the work of itinerant preachers. After giving an account of themselves they asked for information about several points in a way which showed the exigencies of a rude and isolated society, and finally they said that they had been much disturbed by the Lutheran teaching about freewill and predestination, for they had held that men did good works through natural virtue stimulated by God's grace, and they thought of predestination in no other way than as a part of God's foreknowledge. Oecolampadius gave them further instruction, especially emphasizing the wrongfulness of their outward submission to the ordinances of the church: "God," he said, "is a jealous God, and does not permit His elect to put themselves under the yoke of Antichrist." The result of this intercourse was an alliance between the Vaudois and the Swiss and German Reformers. A synod was held in 1532 at Chanforans in the valley of the Angrogne, where a new confession of faith was adopted, which recognized the doctrine of election, assimilated the practices of the Vaudois to those of the Swiss congregations, renounced for the future all recognition of the Roman communion, and established their own worship no longer as secret meetings of a faithful few but as public assemblies for the glory of God.

THE VAUDOIS AND PROTESTANTISM

Thus the Vaudois ceased to be relics of the past, and became absorbed in the general movement of Protestantism. This was not, however, a source of quiet or security. In France and Italy alike they were marked out as special objects of persecution, and the Vaudois church has many records of martyrdom. The most severe trial to which the Vaudois of Piedmont were subjected occurred in 1655. The Congregation *de Propaganda Fide*

established, in 1650, a local council in Turin, which exercised a powerful influence on Duke Charles Emmanuel II., who ordered that the Vaudois should be reduced within the limits of their ancient territory. Fanaticism took advantage of this order; and an army, composed partly of French troops of Louis XIV., partly of Irish soldiers who had fled before Cromwell, entered the Vaudois valleys and spread destruction on every side. They treated the people with horrible barbarity, so that the conscience of Europe was aroused, and England under Cromwell called on the Protestant powers to join in remonstrance to the duke of Savoy and the French king. The pen of Milton was employed for this purpose, and his famous sonnet is but the condensation of his state papers. Sir Samuel Morland was sent on a special mission to Turin, and to him were confided by the Vaudois leaders copies of their religious books, which he brought back to England, and ultimately gave to the university library at Cambridge. Large sums of money were contributed in England and elsewhere, and were sent to the suffering Vaudois.

By this demonstration of opinion peace was made for a time between the Vaudois and their persecutors; but it was a treacherous peace, and left the Vaudois with a hostile garrison established among them. Their worship was prohibited, and their chief pastor, Leger, was obliged to flee, and in his exile at Leyden wrote his *Histoire générale des églises vaudoises* (1684). The revocation of the edict of Nantes in 1685 began a new period of persecution, which aimed at entire extermination. This was found so difficult that the remnant of the Vaudois, to the number of 2,600, were at last allowed to withdraw to Geneva. But the love of their native valleys was strong among the exiles, and in 1689 one of their pastors, Henri Arnaud, led a band of 800 men to the reconquest of their country. His first attempts against the French were successful; and the rupture between Victor Amadeus, duke of Savoy, and Louis XIV. brought a sudden change of fortune to the Vaudois. They were recognized once more as citizens of Savoy, and in the war against France which broke out in 1696 the Vaudois regiment did good service for its duke. The peace of Utrecht saw the greater part of the French territory occupied by the Vaudois annexed to Savoy, and, though there were frequent threatenings of persecution, the idea of toleration slowly prevailed in the policy of the house of Savoy. The Vaudois, who had undergone all these vicissitudes, were naturally reduced to poverty, and their ministers were partially maintained by a subsidy from England, which was granted by Queen Anne. The 18th century, however, was a time of religious decadence even among the Alpine valleys, and the outbreak of the French revolution saw the Vaudois made subjects of France. This led to a loss of the English subsidy, and they applied to Napoleon for an equivalent. It was granted, and their church was organized by the state. On the restoration of the house of Savoy in 1816 English influence was used on behalf of the Vaudois, who received a limited toleration. From that time onwards the Vaudois became the objects of much interest in Protestant countries. Large sums of money were collected to build hospitals and churches among their valleys, and they were looked upon as the possible centre of a Protestant church in Italy. Especially from England did they receive sympathy and help. An English clergyman, Dr. Gilly, visited the valleys in 1823, and by his writings on the Vaudois church attracted considerable attention, so that he was enabled to build a college at La Torre. Moreover, Dr. Gilly's book (*A Visit to the Valleys of Piedmont*), chancing to fall into the hands of an officer who had lost his leg at Waterloo, Colonel Beckwith, suggested an object for the energies of one who was loth at the age of twenty-six to sink into enforced idleness. Beckwith visited the valleys, and was painfully struck by the squalor and ignorance of a people who had so glorious a past. He settled among them, and for thirty-five years devoted himself to promoting their welfare. During this period he established no fewer than 120 schools; moreover he brought back the Italian language which had been displaced by the French in the services of the Vaudois church, and in 1849 built a church for them in Turin. He lived in La Torre till his death in 1862, and the name of the English benefactor is still revered by the simple folk of the valleys.

BIBLIOGRAPHY.—Modern critical study starts with J. J. Döllinger, *Beiträge zur Secktengeschichte des Mittelalters* (1890) and E. Combo, *Histoire des Vaudois* (1898). *See* also H. Lea, *History of the Inquisition in the Middle Ages;* J. Chevalier, *Mémoires sur les Hérésies en Dauphiné* (1890); J. A. Chabrand, *Vaudois et Protestants des Alpes* (1886); W. F. Adeney, art. WALDERSEE, ALFRED, COUNT (1832–1904), Prussian field marshal, made his first campaign (that of 1866) as aide-de-camp to General of Artillery Prince Charles of Prussia, with whom he was present at Königgrätz. In the Franco-German War he was present at Metz and joined the staff of the grand duke of Mecklenburg-Schwerin, who was operating against Chanzy's army on the Loir. In 1881 Waldersee became Moltke's principal assistant at Berlin. He succeeded Moltke as chief of the general staff in 1888, and during the Boxer insurrection in China in 1900, he was placed in command of the joint forces. He arrived, however, too late for the fighting before Peking. He died on March 5, 1904.

WALDO, SAMUEL LOVETT (1783–1861), American artist, born in Windham, Connecticut, April 6, 1783. He began with a studio in Charleston, South Carolina. In 1806 he went to London, where he painted portraits for some years with success. In 1809 he returned to New York, and was a conspicuous figure in the city's art life until his death there on the 16th of February 1861. He became an associate of the National Academy in 1847. Among his works are a series of portraits of the early mayors of New York, now in the New York City Hall, a portrait of Peter Remsen, in possession of the New York Historical Society, and two portraits of John Trumbull.

WALDSTEIN, FERDINAND, COUNT (1762–1823), the youngest son of Graf Waldstein und Wartemburg von Lux, was born on March 24, 1762. At Bonn, Beethoven received encouragement from this young nobleman, whom he immortalized by dedicating to him his opus 53, afterwards known as the "Waldstein" sonata. A theme of Count Waldstein's also served for a set of 12 variations for piano duet, written by Beethoven in 1791 or 1792. Waldstein died on Aug. 29, 1823.

WALENSEE, also called the Lake of WALLENSTADT, a Swiss lake. It is formed by the Seez river, which now enters the lake at its eastern end. Near its western end the Linth has been diverted through the Escher canal (completed in 1811) into the lake, from which it soon again issues in order, by means of the Linth canal (completed in 1816), to flow into Lake Zürich. The Walensee has an area of 9 sq.m. It is 495 ft. deep, and its surface is 1,388 ft. above sea-level. On the northern shore rises the seven-peaked range of the Kurfursteñ (7,576 ft.). On the south side are the crags of Murtschenstock (8,012 ft.).

WALES, PRINCE OF: *see* EDWARD, PRINCE OF WALES.

WALES. The principality of Wales (*Cymru, Gwalia, Cambria*) in Great Britain has an area of 4,780,470 ac. and a population (1921) of 2,205,680. Its maximum length from north to south is 136 m., while its breadth varies between 92 m. from St. David's head to the English border near Crickhowell, and 37 m. in central Wales between Aberystwyth and the Shropshire boundary.

Structure and Physical Features.—Wales is a hill country composed almost entirely of Palaeozoic rocks much dissected by deep valleys. The portion of the central highland mass above 2,000 ft. is sharply worn by deep cut cirques and is in marked contrast to the more rounded hills below that elevation. Anglesey is a remnant of a very ancient land mass that formed the nucleus against which the mountains of Carnarvonshire were thrown up as Palaeozoic Wales in its turn became the old block against which the newer geological deposits of England were built up. The worn-down ribs of the ancient land in Anglesey (Môn) still run as moorland between slightly lower lines of marsh. One of these lower north-east to south-west lines forms the picturesque Menai strait with Carboniferous layers along its edges. It is, as it were, the structural trough between the old block and the folds. The great north-east to south-west mountain line of Carnarvonshire (*q.v.*) culminates in Snowdon (3,560 ft.), the highest mountain in England and Wales. Carnedd Dafydd (3,426 ft.) and Carnedd Llewel-

lyn (3,484 ft.) is especially marked. The mountain line tapers out south-westward to the peninsula of Lleyn, which has some hills of crystalline rock, and ends in the Island of Bardsey (Ynys Enlli)—the isle of the saints. A low line running north-east to south-west cuts off the main range from another lofty group culminating in Moel Siabod (2,860 ft.). The Snowdon country is interspersed with lakes: those in the valley bottoms—long and deep—show evidences of glacial as well as structural factors and contrast markedly with the smaller, rounder, darker lakes of the cirques. To the south in Merionethshire, is the so-called Harlech dome. The southern section of this volcanic tract is marked off by a region of faults. The major fault runs from Corwen to Bala and thence to the sea. It is best known as the Bala Cleft. Cader Idris (2,927 ft.). Aran Mawddwy (2,970) and Arenig (2,800) are conspicuous peaks.

To the east and south, there stretches a vast plateau of crumpled grits and shales in an endless succession of rounded hills from Denbighshire around to north Pembrokeshire. Plynlymon (2,468 ft.) is among the higher points of this central moorland. The region is covered to a great extent by boulder clay giving a cold, wet subsoil with many bogs and consequently able to support only a small population.

To the south and east of this crescent plateau of pre-carboniferous rocks lies the country of the Old Red Sandstone and the coal measures. This region is more varied in relief with outstanding hills of sandstone like Radnor forest (2,163 ft.) or the steep scarp of the Brecknock Beacons (2,907 ft.), the Black mountains or the volcanic rocks of the Breidden. The coal measure country has become very distinct from the rest of Wales in many respects, whether we consider the belt on the English border in Flint and Denbigh or the great coalfield of South Wales. The latter is oval in form, becoming narrower at its western end in Pembrokeshire. Geologically it is a syncline within which the hard bands of Pennant grit stand out above the deeply incised valley-ways. Numerous streams flow right across the coalfields in long, narrow, steep-sided valleys that limit possibilities of settlement and communication. Many of the resulting problems, both industrial and social, have been very difficult. (*See* RHONDDA.) The south side of the coalfield known for the most part as the Vale of Glamorgan has Triassic and Liassic rocks with much fertile soil.

The south coastal plain of Wales is broken by the sea giving Carmarthen and Swansea bays. The north Wales coastline is low westwards from the Dee estuary, but Great Orme's head, a peninsula of Carboniferous limestone, stands out, as does the igneous rock of Penmaenmawr farther west. The coasts of Lleyn are rocky, as many of the mountain lines die away to the sea. The former low ridges between the valleys run out to sea as partly submerged causeys. They are known locally as *Sarnau*.

South-west Wales sends out hard, resistant bands of old rock to form numerous headlands, the softer rock between being worn away to form small bays in the coast of north Pembrokeshire. In south Pembrokeshire we have a coast with the great submerged valley or ria of Milford Haven. There are evidences of subsidence along the south Wales coast in the west; submerged forests are recovered from Amroth. The rivers may be said to fan out to sea from the interior highland mass. In the north we have the Clwyd and the Conway. On the west the Dwyryd, Mawddach, Dyfi, Rheidol, Ystwyth, Teifi, and on the south the eastern and western Cleddau, the Tâf, Towy, Loughor, Nedd (Neath), Taff and Wysg (Usk). It is these radiating valleys, or rather those of them which are more shut off from the English influences working along the coastal plains, that are the special homes of the Welsh heritages. The interior highland mass is drained also by rivers which fall to the lowlands of the English border—the Dee, Severn and Wye, and these valleys have offered opportunities for contacts between English and Welsh.

Peoples and Settlement.—The earliest traces of man in Wales are known from Paviland cave in the Gower which seems to have been inhabited in the later Palaeolithic age. As pine forests spread with the return of a somewhat milder climate after the Glacial period, Wales was inhospitable to early man, especially as the only flint available in it was that derived from boulder clay belonging to an ice sheet that worked its way south from Scotland down into Cardigan bay. People appear to have drifted to Wales finding forest free spots on the windswept tops of the lower moorland and along the shore where in several places occur flint chipping floors with implements of early type but unknown date. Among the early drifts there came to Wales survivals of what appeared to be Aurignacian types of men still to be found in remote moorland areas such as Plynlymon and the Black mountain region of Carmarthenshire. These people have dark hair and eyes with long, high-ridged heads, big eyebrows and rather prominent mouths. A very much larger element in the Welsh population are the little dark people with dark hair and eyes and rather long heads and slender build. These represent early drifts from south-west Europe by land and sea. Wales, with its volcanic rocks in the north-west and the south-west, was more attractive to people who had learnt the art of polishing stone and the principality has yielded many beautiful examples of polished stone axes. A proportion of the population on coastal patches in south Glamorganshire, north-west Pembrokeshire, Ardudwy and elsewhere, belongs to a type with broad head, strong jaws, with very dark hair and often strong, tall build. Similar people occur on many of the coastal patches of south-west and western Europe and represent emigrants or traders of the early ages of metal. In several, though not in all cases, this type occurs in regions with megalithic monuments, and these are important in the projecting peninsulas of north-west and south-west Wales.

The stone circle seems to have been of special significance in west Wales, as recent evidence has shown that the stones of the inner circle at Stonehenge were originally derived from north-west Pembrokeshire. (*See* H. H. Thomas, "The Source of the Stones of Stonehenge" *Antiquaries Jour.* Vol. III. p. 239, 1923.) The arrival of large numbers of Beaker folk at the dawn of the age of metal in Yorkshire and East Anglia does not seem to have influenced Wales to any great extent, although there are evidences of their culture along the south Wales coastal plain and in the north. The Bala Cleft has yielded many examples of the broad-headed, fair tall type with arched skull and deep-set eyes that is associated with Beaker burials in England and the Continent. The movement of Bronze swordsmen through western Europe to Britain and Ireland in the later Bronze age is thought by some to be responsible for the spread of the Gaelic languages now surviving in Ireland, the Hebrides and north-west Scotland; it apparently had relatively little influence in Wales. The movement of the La Tène culture from the Continent to Britain in the last centuries B.C. are usually associated with the spread of Brythonic Celtic speech, the foundation of the Welsh language. This movement entered Wales very likely just before or during Roman times along valleys stretching up from the English plain and probably along the coastal plains as well. The newcomers appear to have strengthened the Nordic, or tall, fair, long-headed elements in the population, and it is to this period that we can ascribe many hill-top fortresses that guard the lower slopes of the Welsh moorlands. It is thought that the builders of these hill-top camps were native peoples in some fairly peaceful relation with the Romans, and in Cardiganshire their influence was strong where the traces of Roman work are weak.

In post-Roman centuries Wales, in common with most of western Europe, entered difficult times. There were several invasions of Brythonic tribes many of which have become known as the sons of Cunedda. Welsh folk tale illustrates culture-clashes between iron-armed people of the valleys and older populations on the moorlands and one suspects that these are the clashes of pre-Roman times coloured by those of post-Roman centuries. The influence of the sea again became important. Raiders of mixed ancestry, but mainly Irish, landed not infrequently on the northern and western shores, while it is claimed that an invasion of the Irish Deisi entered south-west Wales in the 3rd century A.D. This influence was at work in peace as well as in war as is shown by the Celtic saint movements of the 5th and 6th centuries. Old links with the west—with Ireland, Cornwall, Brittany and north-west Spain—became again important, resulting among other things in

focusing the country's ecclesiastical traditions at St. David's (*q.v.*). The subsequent centuries saw similar raids from Scandinavian peoples who had settled in Ireland and the Western isles. Many Scandinavian place names are still found on the coastal patches especially in south Pembrokeshire and south Glamorganshire. New peoples entered Wales, not only from the western seas, but also along her landward frontier. The ways that led into the country through the gaps that were guarded by Chester in the north, Ludlow and Shrewsbury in the centre and Gloucester in the south, became henceforth the main entries of new cultures. The Norman conquest provided Wales with new elements in its population. Districts in south Pembrokeshire and the Gower peninsula seem to have been systematically colonized with Flemings by Henry I. and Henry II.

In subsequent centuries Wales received immigrants from the Continent to those areas where weaving was important.

Population.—In 1921 the total population of the principality was 2,205,680. The sparseness of inhabitants on the hill pastures and the crowding of the coalfield has made the distribution of population very uneven. The density per square mile (1921) was 1,028·5 in Glamorganshire, while in the hill-pastures it falls to 50 (*e.g.*) in Radnorshire.

County	Area in sq. miles	Population 1871	Population 1901	Population 1921	Density per sq. mile 1921
Anglesey (Ynys Môn)	276·0	51,040	50,606	51,744	187·5
Breconshire (Brycheiniog)	733·3	59,901	54,213	61,222	85·2
Cardiganshire (Aberteifi)	602·3	73,441	61,078	60,881	88·0
Carmarthenshire (Caerfyrddin)	918·4	110,710	135,328	175,073	190·3
Carnarvonshire (Arfon)	571·8	106,121	125,649	130,975	229·3
Denbighshire (Dinbych)	665·7	105,102	131,582	154,842	233·0
Flint (Fflint)	254·7	76,312	81,485	106,617	419·0
Glamorganshire (Morganwg)	792·6	397,859	859,931	1,252,481	1,028·5
Merionethshire (Meirionydd)	659·4	46,598	48,852	45,087	68·3
Montgomeryshire (Drefaldwyn)	797·0	67,623	54,901	51,263	64·0
Pembrokeshire (Benfro)	613·6	91,098	87,894	91,978	150·0
Radnorshire (Faesyfed)	470·6	25,430	23,281	23,517	50·0
Total	7,446·0	1,217,135	1,714,800	2,205,680	..

Two centres only, namely Cardiff (200,184) and Swansea (157,554) have over 100,000 inhabitants, and of the remainder only two others, Aberdare (55,007) and Merthyr Tydfil (80,116) have over 50,000 inhabitants. Llanelly, Barry, Caerphilly, Maesteg, Mountain Ash and Pontypridd have over 25,000 inhabitants. All these centres are on the south Wales coalfield.

Religion.—Classical references to religious cults in pre-Roman Britain have been the pretext for much conjecture as to the nature of the pre-Christian religions of Wales. All that can be said is that the island of Anglesey seems to have had a tradition of special sanctity. The post-Roman centuries were characterized by a revival of prehistoric conditions in the west and although Christianity reached here very early the salient feature is its close associations with the previously existing traditions. The church of Yspytty Cynfyn in north Cardiganshire is built within what was once a stone circle and observers have recorded many circular churchyards in Wales. The spread of the Celtic saints or preachers of Christianity from Ireland to Wales, Cornwall, Brittany and many parts of the Continent helped to make St. David's (*q.v.*) important. It stands at the convergence of a number of routes from little landing places on a storm-washed peninsula. The itinerant Celtic saints established many small cells or churches in Wales, many of which still bear the founder's name in their dedication. From the 7th century onwards the power of the Roman Church grew and the older Welsh traditions were brought nominally under its sway. The attempts of Giraldus Cambrensis in the 12th century to gain ecclesiastical independence for Wales are an echo of the marked individuality of the Celtic traditions.

Among pilgrim routes to Santiago da Compostella (*q.v.*) the maritime one from Ireland via Wales, Cornwall and Brittany was important, and it seems to have been also a survival or revival of a prehistoric route of trade. By the Renaissance the Roman Church had gathered into itself and assimilated all the earlier ritual, and the Anglican Church did not replace it completely in rural Wales. The strongholds of Anglicanism were in the small castle-towns of the coastal plains. The mass of the population of moorland Wales long retained its mediaeval ideas. Early Puritanism appeared in those regions that had the closest associations with the English plains and particularly in those regions that had specialized in weaving. Such districts attracted refugees from the Continent.

Radnorshire became an early centre of the Quakers and Baptists, Montgomeryshire of the Independents, while in the weaving centres of the south Wales coastal plains early Puritanism was developed especially by the Independents and the Baptists who seem to have been specially selected for persecution and whose early chapels are in several cases in remote spots. They seem to have entered regions in south-west Wales (*e.g.*, North-west Pembrokeshire) that were sparsely populated in the middle ages, a movement that seems to have been associated with the introduction of root crops. The Methodist revival of the 18th century, mainly through the influence of the Welsh language, affected chiefly the moorland regions of Wales. Henceforth the country was predominantly Nonconformist. In 1910 it was estimated that there were 550,280 full members of the Nonconformist Churches as against 193,081 members of the Anglican Church.

In 1914 the Bill for the Disestablishment and Disendowment of the Church of England in Wales was passed.. It provided that the secularized portion of the endowment of the Church should be applied to specified national purposes, mainly educational, and a financial amendment in the direction of compensation to the Church was passed in 1919. Under the new Constitution (1922) the supreme authority of the "Church in Wales" was vested in a governing body, representative of the clergy and laity. The area that came under the jurisdiction of this body became known as the province of Wales, with an archbishopric, established for the time being at St. Asaph. Two new dioceses were created, namely Monmouth (1921) and Brecon and Swansea (1923) out of the older dioceses of Llandaff and St. David's respectively. The ecclesiastical province of Wales contains (1928) six dioceses; Bangor in the north-west, St. Asaph in the north-east, St. David's in the south-west, while the populous area of the south-east is shared between Swansea and Brecon (including the almost entirely rural counties of Brecon and Radnor), Llandaff and Monmouth.

Roman Catholicism is still strong here and there in the border counties, especially Flintshire. In most cases it survives in conjunction with mediaeval landed families. Since the last half of the 19th century it has flourished exceedingly in the south Wales industrial regions, especially among the immigrants of Irish descent. Since the expulsion of the religious orders from France in 1903, several communities of French monks and nuns have taken up their abode in the principality. With the exception of Glamorganshire, the principality is in the diocese of Menevia. There is a Roman Catholic archbishop at Cardiff, whose diocese includes Glamorganshire, Monmouthshire and Herefordshire.

The majority of the followers of the Methodist revival movement of the 18th century in Wales form the Calvinistic Methodist Church of Wales which is especially strong in the north and west of the country. Its churches are usually strongholds of the Welsh language, although it includes many churches in which English is used in the services. It is organized under the *Cymanfa Cyfredinol* (general assembly) which meets annually and elects a moderator. There are two synods (*Cymdeithasfa*) representing respectively the north and south of the country. The individual churches are grouped into a *Cwrdd Dosparth*, and the latter into a larger unit the *Cwrdd Misol*. The Calvinistic Methodist Church is affiliated to the Presbyterian Church of England. Other followers of the Methodist revival are members of the Wesleyan Methodist Church; its churches, with Welsh services, are organ-

ized under a conference which is in several points distinct from the English conference of this Church. The Independents and Baptists have each a union (*Undeb*) for Wales, but retain many connections with the corresponding unions of England. In the last two organizations each church is a self-governing unit.

(E. G. Bow.)

University. (*See* UNIVERSITIES.)—The university was founded by charter in 1893, and re-organised with a supplemental charter in 1920. It now consists of the four university colleges at Aberystwyth, Bangor, Cardiff, and Swansea. The majority of the members of the governing body are elected by county and county-borough councils in Wales and Monmouthshire, which councils support the university by the levy of rates for the purpose. All the main branches of cultural education are provided for, and some special attention is given to Celtic studies and to music. The National school of medicine is at Cardiff. During recent years at all the four centres new buildings for instruction and research and for the social activities of the students have been erected. Extramural studies have been strongly developed throughout Wales. In addition to the regular financial support mentioned above, since 1910 there have been benefactions to the extent of a capital value of over £380,000. The total number of students is nearly 3,000. (A. L. Wi.)

ECONOMIC AND INDUSTRIAL CONDITIONS

Wales and Monmouthshire form an area, approximately one-seventh of England and Wales. One-half of the land reaches an altitude of 600 ft. above sea-level, while one-half of this exceeds 1,000 ft. This nature of the country enabled its inhabitants to maintain a distinct political existence for centuries after the English lowlands had become subject to one authority. It was not until the 19th century that the traditional isolation of Wales began to be profoundly affected by the development of railways. World competition is now operative to the embarrassment of local industries previously protected by the isolation of the local market. Despite present indications of slackening in the rate of rural depopulation in Wales, due to the depressed condition of industry, the movement constitutes a most urgent problem.

The Industrial Revolution in Wales.—In 1801 Wales and Monmouthshire had a population of 587,245, fairly evenly distributed over the land as the vast majority of the people were engaged in agriculture or in related occupations. As the industrial revolution developed, and particularly after 1841, the rural exodus, accompanied by the decay of many industries which had supplemented the earnings of agriculture, led to an enormous concentration of population in the iron and coal producing valleys of south-east Wales; eventually nine out of the 13 counties included in Wales and Monmouthshire suffered an actual decrease in population. By reason of the variety and superior quality of its output and because of its close proximity to tidal waters, the South Wales coalfield became from 1881 the chief coal-exporting region of the world.

In the record year 1913 the output of the coalfield was 56,830,000 tons and the number of miners was nearly a quarter of a million. Normally over 70% of the output is carried away by sea, about 45% passing through Cardiff alone, which has increased in population since 1841 at the rate of 10,000 for every additional million tons of coal shipped annually from the port. According to the latest official returns (1921 census) the population of Wales and Monmouthshire was 2,657,412, of which well over 50% (1,703,401) was concentrated in the two counties of Glamorgan (1,252,701) and Monmouth (450,700).

Welsh Coal Mining.—The mining valleys of South Wales present difficulties. They are narrow, with swift-running streams and precipitous mountain slopes; they are in some cases practically cul-de-sacs deeply trenched in the bleak and infertile uplands. The level ground is occupied by roads, railways, canals and the surface works of the collieries, and the hillsides are used as waste tips. There is little room for houses and the congestion is often very great. In the Rhondda valleys, where the best steam coal is mined and which have a population of 162,729, the density of population in the area actually built upon is about 23,000 persons to the square mile. The same causes, which have given Welsh coals their superiority, have also made mining in this area more costly and dangerous than in other parts of Britain. Welsh coal is dry and fiery and the fine coal dust is a constant source of danger. Loose-jointed coal and loose or rotten roof, more frequent in South Wales mines than elsewhere, are responsible for numerous accidents accompanied by loss of life. For these reasons, the output per man is less than the average for the rest of Britain. But the superior quality of South Wales coal commands a price which balances the extra cost of production.

Since there is practically no choice of occupation, chronic unrest is almost inevitable, especially in times of trade depression. The rapid development of the fuel resources of all countries during the war years and the consequent keen competition for markets, have seriously affected export. Since 1923 unemployment and "short time" have been prevalent and have entailed great hardship and suffering. In Dec. 1927 the number of miners employed in the coalfield was 177,700 as compared with 220,200 at work in 1924. The output of coal in 1927 was 45,500,000 tons as compared with 56,830,000 tons raised in 1913. In 1927 134 pits were closed down and at times the number of unemployed coal workers in South Wales has reached 100,000.

In no part of Britain is the need for the "decentralization of industry" more urgent than in the South Wales coalfield. In the last five years research committees have considered schemes of large scale town-planning in anticipation of further development and also with a view to altering the present distribution of the population. These schemes include the creation of new urban centres in the coastal region to accommodate a large proportion of the population of the mining valleys. This would require a great extension of the means of communication, the development of cheap and rapid transport and the rise of manufacturing industries of a general character which would absorb an appreciable part of the coal output and provide variety in employment.

Iron and Copper.—Prior to 1870 the leading place in the economic development of South Wales was held by the iron industry. Along the northern edge of the coalfield plentiful and readily accessible supplies of coal, iron ore and limestone occurred in close proximity. Consequently, in the first half of the 19th century a narrow upland tract, extending for about 20 m. from Pontypool and Blaenavon to Hirwain, with its chief centre at Merthyr-Dowlais, became the greatest iron producing region in the world. The invention of processes for the large scale manufacture of steel and the resulting demand for richer and purer iron ores than those found in the coalfield, caused many of those works to be closed or to be transferred to the seaboard. Merthyr Tydfil, once the largest town in Wales, which in 1831 exceeded in population the aggregate of Newport, Cardiff and Swansea, is steadily declining owing to these changes; in some of the old inland centres, such as Ebbw Vale, Rhymney and Dowlais, the manufacture of iron in specialized forms is still actively maintained. On the south-west of the coalfield the hill country extends to the coast line and in many places coal is mined within a short distance of tidal water. This is the anthracite region and since 1910 90% of British anthracite, the great bulk of which is exported, has been raised in South Wales.

The western ports, Llanelly, Swansea and Port Talbot, are not only centres of the coal export trade but their favourable situation has enabled them to develop great metallurgical industries the success of which depends upon supplies of cheap fuel. Of these the earliest and long the most important was the smelting of copper; Swansea became the centre of the world production of copper. Before the end of the 19th century, however, copper ores came to be generally smelted at the mines but refining processes are still carried on in the Swansea area which has also continued to increase the output of metallurgical products originating in the early copper industry. The refining of nickel, imported in a crude state from Canada, is a new and flourishing industry.

Tin-plate, Oil Refining.—In the last quarter of the 19th century the manufacture of tin plates and of galvanized iron became localized very largely in this region. This resulted from the establishment of steel works in the coastal section of the coal-

field, aided by the discovery that sheet steel was to be preferred to iron in the making of tin plates. Over 90% of the export trade of British tin plates is concentrated in the port of Swansea, which in 1927 shipped 440,000 tons of tin plates and terne plates valued at £9,500,000. Owing to their high reputation, Welsh tin plates are imported into every country in the world, often in spite of high protective tariffs. More than 90% of the zinc smelted in Britain is produced in the Swansea district (spelter works). The zinc is chiefly used in the making of alloys, brass, bronze, etc., but scarcely less important is the industry of manufacturing galvanized iron by coating iron plates with zinc. In 1927 721,000 tons of galvanized iron sheets were exported from Swansea.

The establishment of the oil refinery of the Anglo-Persian Oil Company at Skewen, near Swansea, has increased the trade of the port of Swansea by about 2,250,000 tons annually.

North Wales.—North Wales is more closely related in its economic life to Lancashire and the Midlands than to South Wales, for east to west routes are far more practicable than from north to south in Wales. The North Wales coalfield lies in the counties of Flint and Denbigh and extends for about 40 m. from south to north along the Dee valley. Although extensive, it is far less rich and varied in its output than the South Wales field. The annual output remains fairly constant at about 3,500,000 tons. The coal obtained is used chiefly for domestic purposes and for gas manufacture, the Cannel coal of Flintshire being specially reputed for its gas producing qualities. Thus, as the North Wales coal industry depends mainly upon the home market, it has suffered relatively less in recent years than the South Wales coalfield from the intense depression of the coal export trade. However, owing to excellent transport facilities by road, rail and canal, and the proximity of tidal water a great variety of industries has developed in this region and new ones are continually rising. In the inter-censal period 1911–1921 the proportional increase of population was higher in Flintshire (14·8%) than in any county of England and Wales, being 1% higher than that of Monmouthshire, which came second, and 2% higher than Glamorganshire which was in the third place.

It is noteworthy that the rapid development of road transport in the same period has effectually checked the tendency towards the concentration of the workers. Large numbers of them are conveyed by road from their homes in the villages and rural areas to the factories and works. The first iron works in Wales was established at Bersham near Wrexham (1701) and the metal industries of the area continue to be of great importance; the manufacture of iron and steel, of galvanized iron and tin plates is carried on at several centres. There are shipyards and engineering works while the chief centre of the fine chemical industry in Wales is at Ruabon which is also famous for the production of terra cotta. Woollen, paper and artificial silk mills, having the most modern equipment, are found at Holywell and Flint.

North-west Wales (Carnarvon and Merioneth) is the principal seat of the Welsh slate-quarrying industry, of which the chief centres are Bethesda, Llanberis, Nantlle and Festiniog. This industry is steadily reviving after the depression of the war years through the extensive use of modern machinery and of electric power and the utilization of the waste dumps for the production of commodities of commercial value. The annual output of Welsh slate is about 250,000 tons, valued at £2,000,000. The minerals of North Wales, excluding coal, give employment to about 33,000 workers and are valued approximately at £4,000,000 a year.

There is a rapid growth of hydro-electric enterprise. In 1907 the Aluminium Corporation laid down plant for the manufacture of aluminium at Dolgarrog and eventually combined with the North Wales Power company to provide electric power and light for North Wales. With Government support, schemes were undertaken which were estimated to cost £2,000,000 and already three great power stations have been established. The power will tend to revive languishing local industries and to check rural depopulation. Large towns outside Wales, notably Liverpool, Birkenhead and Birmingham, derive water from the Welsh hills.

Agriculture.—About 120,000 persons are engaged in agriculture. Owing to the mountainous character of the land and the heavy rainfall, which in some districts reaches 120 in. agricultural Wales is mainly devoted to the production of milk and meat. About one-third of the agricultural land consists of heath land, rough pasture and bog. It is devoted to extensive sheep walks. The cultivation of wheat, which is particularly risky owing to the heavy rainfall, is confined entirely to the deeper river valleys and accounts for only 5% of the arable land. The greatest production is in the Vale of Glamorgan, in the valleys of the Wye and the Usk in Monmouthshire. Barley and oats are grown fairly generally, the latter cereal being sufficiently hardy to return a good yield at a height of 1,000 to 1,500 ft. above sea level. Root crops for the feeding of store cattle occupy the remainder of the arable land. Cattle reared on the upland pastures of Wales are sold in great numbers to English graziers; they fatten rapidly on the richer lowland pastures. Wales maintains about 4,000,000 sheep, including the hardy native mountain breed, and these are likewise sold for the English market. In the past 30 years agriculture in Wales has made marked progress through the application of more scientific methods to all branches of farming in which the University colleges at Bangor and Aberystwyth, with the support of the Board of Agriculture, have rendered invaluable service. The extension of organization and co-operation have materially aided the farmers in tiding over the period of depression which followed the factitious prosperity of the war years. Agricultural co-operative societies, first established in Wales in 1901, multiplied rapidly and in 1922 a Welsh agricultural organization society was founded.

Small mixed holdings of the average size of 47 ac. are characteristic of Wales and the small holders were quick to grasp the advantages provided by the co-operative purchasing of foodstuffs, implements, etc. The independent Welsh Farmers' Union, founded in 1918, has recently been merged in the National Farmers' Union. The Government proposals of 1928 for rating relief in the case of agricultural land and for the provision of agricultural credit should produce, when carried into effect, a stimulating influence upon this vital industry.

HISTORY: I. 1 TO 1485

Wales was won for the Roman Empire by Frontinus and Agricola. The former was legate in Britain from A.D. 74 to 78 and in the course of his term of office crushed the Silures, the warlike tribesmen of south-eastern Wales. Further to the west were the Demetae, of the country round Carmarthen; they were probably subdued at the same time. Agricola's first act, upon his arrival in 78, was to conquer the Ordovices of mid-Wales; in the same campaign, he attacked the tribes of the north-west, crossed the Menai Straits and completed the conquest of Anglesey, from which Suetonius had been recalled eighteen years earlier. The island had been the stronghold of the Druids and throughout its history has held an exceptional position as an area of great fertility (hence known as "Mon mam Cymru," *i.e.*, Mona, the mother of Wales), defended from attack by a rampart of mountains. Wales was effectively held throughout the period of the Roman occupation of Britain, but always as a part of the imperial frontier, and by purely military measures. Two of the three legions quartered in the island after 120 held the portals. The Twentieth was stationed at Deva, the modern Chester, known to the Welsh ever since as Caerlleon, the Second Augustan at Isca, also known to later times as Caerllion and Caerleon. From the two legionary stations roads ran west to smaller forts such as Segontium (Caernarvon), Conovium (Caerhun), Cardiff and Gelligaer; roads and forts of the same type were built in the interior. Some of these forts, perhaps, served only a temporary purpose, but it is clear from the absence in Wales (save around Cardiff and Newport) of Roman towns and country houses that the region had no settled civil life of the type found in Eastern Britain. Recent excavations, notably at Dinorben, near Abergele, show that the natives, while not uninfluenced by Roman culture, lived for

the most part an independent and semi-barbarous life and still occupied the rude stone and earthen hill-forts of their ancestors. The survival of Welsh, a Celtic language akin to Gaulish, supports this conclusion and that it should contain a large number of Latin loan-words is natural. (*See* BRITAIN, ROMAN.)

Irish and Saxon in Wales.—In the age following the abandonment of Britain by the Empire, the two outstanding features are the conflict between the Brythonic and the Goidelic elements and the rapid conversion of the country to the Christian faith. It is beyond doubt that, in the fifth century, western Wales was occupied by an Irish-speaking people; the traditions on the subject have been confirmed by the discovery of Ogham inscriptions, especially in Pembrokeshire and Carmarthenshire. Whether these Goidels were aboriginal or invaders from Ireland is still an open question; in either case, they were overborne by Brythonic conquerors from the east and their language became extinct. Tradition ascribed the Brythonic triumph in Gwynedd (northwest Wales) to a leader from North Britain named Cunedda, whose posterity became kings of various districts from Cardigan to Denbigh. As to the coming of Christianity, there is nothing to associate it with Roman rule in Wales. Yet, in the middle of the sixth century, it is to be gathered from the *De Excidio* of Gildas (the one British work of this epoch which has survived) that the British princes who had risen to power on the ruins of the old order were Christians, and, if lawless and licentious, yet amenable to the influence of the Church. He mentions especially Maglocunus, the Maelgwn Gwynedd of Welsh tradition, lord of Anglesey and Snowdonia, and great grandson of Cunedda, as having at one time forsworn his realm and become a monk. Monasticism, in fact, was the movement which wrought the transformation; Wales was converted by the monks, the "sancti" of Gildas, to which company belonged Dewi, became in Norman times the patron saint of Wales.

While these events were taking place, the eastern side of Britain was being occupied by English settlers. Wales was not, at first, greatly affected, for the flight of the defeated Britons into the mountains of the west is legend, and not history. But at the beginning of the 7th century a new problem arose, which was directly due to the Saxon conquests. When Augustine, after the conversion of Kent, strove to establish relations with the British clergy, he met with unexpected opposition and failed in his purpose. The differences were merely the result of the long separation between the Celtic and the Continental churches; they did not affect doctrine, but concerned such practical questions as the true date of Easter. Nevertheless, they were sufficient to bring about a schism, which was still violent in the time of Bede; the Welsh Church did not accept the Roman Easter until 768, when it finally gave way at the instance of Elfodd, who was bishop in North Wales. By this time, secular life in Wales had also come to feel the full force of the English impact. The victories of Wessex, notably that of Deorham in 577, had parted the Welsh of Gwent and Glamorgan from their brethren in Somerset, Devon and Cornwall; in the north, the efforts of Cadwallon of Gwynedd, who fell in 634 in battle with Oswald of Northumbria, did not avail to maintain British ascendancy in that region, with the result that, in the eighth century, having lost Chester, Shrewsbury and Hereford to the Mercians, the Welsh were confined to the mountainous tract in the west which has ever since been their home. It was Offa (757–796) who definitely marked the boundary by the dyke which bears his name, a "travelling" earthwork connecting the mouth of the Clwyd with the Wye above Hereford and shown by place names to have been for centuries the actual frontier between the two races.

Wales bore the full brunt of the attacks of the Northmen. Her monasteries, distributed along the coast and often set, as was the manner of the Celts, on lonely islands, suffered grievously. St. David's was often in peril, but contrived to keep up a tradition of learning, of which the leading representative in the ninth century was Asser, the friend and biographer of Alfred of Wessex. It does not appear, however, that the pirates made any substantial settlement on Welsh soil; they were held at bay by the gallant Rhodri the Great (844–878), founder of the princely houses of Gwynedd and Deheubarth (South Wales) and ruler of all Wales save Dyfed (the land of the Demetae), Brecknock, Gwent and Glamorgan. Through all the confusion of the next hundred and fifty years, a time of conflict with the Northmen and with the Mercians, as well as of internal strife, the line of Rhodri maintained itself in its two branches in North and in South Wales. It produced one remarkable man in Hywel the Good (910–950), a scion of the southern line, who married the heiress of Dyfed, journeyed to Rome in 928 and is styled "King of all the Welsh." His position enabled him to undertake a reform of Welsh law, for which posterity gratefully remembered him; the representative gathering which met at Whitland (Y Ty Gwyn ar Daf) to receive the new code is without a parallel in the early annals of Wales, and "the law of Hywel," amplified and re-edited by generation after generation of Welsh legists, became the standard of tribal and personal relations throughout the country. In its precision and subtlety, it has been held (by Loth) to be the greatest intellectual achievement of mediaeval Wales.

The Norman Conquest.—On the eve of the Norman conquest, there was a striking outburst of activity under one of the ablest of Welsh princes. Gruffydd ap Llywelyn (1039–1063) was not of the ruling dynasty, yet he succeeded in making himself master of the whole of Wales—a position never reached by any Welsh chieftain in later times. He owed his power to his success against the Mercians, whom he drove out of their villages in the neighbourhood of Prestatyn, Mold, Wrexham, Oswestry, Montgomery, Knighton and Radnor. Later, he formed an alliance with Aelfgar and Mercia against the Normans whom Edward the Confessor had posted at Hereford (1055); on Aelfgar's death, he was exposed to the hostility of Harold Godwinson and by him was overthrown. His meteoric career made a great impression in England and led to the question of Wales being envisaged there as one of national defence. When William I. had completed the subjugation of the English, he attacked this problem with his usual insight and, as a first measure, set up the three earldoms of Chester, Shrewsbury and Hereford to protect the realm from the ravages of the Welsh. Further, he encouraged his followers to win land for themselves in North Wales, and to such good purpose that in 1098 the earls of Chester and Shrewsbury had almost conquered Anglesey. In that year, however, the Normans discovered their weakness in sea power, without which the island could not be held; the attempt to subjugate Gwynedd was abandoned. Progress in South Wales had been slower; the Conqueror had here recognized the claims of Rhys ap Tewdwr (1078–1093), who had stepped into the dominant position in the south through the signal victory of Mynydd Carn (1081), won in comradeship with Gruffydd ap Cynan of Gwynedd. On the death of Rhys, however, the floodgates were opened and Norman adventurers swept irresistibly over the southern area.

During the reign of Henry I., the Welsh problem appeared to have been settled. The Norman hold upon South Wales was complete, extending even to the bishopric of St. David's, and the line of Rhys ap Tewdwr was almost forgotten. Powys, the region between Chester and Machynlleth, kept its independence under the posterity of Bleddyn ap Cynfyn (d. 1075), but it was much enfeebled by the quarrels of the reigning house. The weak spot in the Norman system was Gwynedd; here, behind the shelter of the Snowdonian range, Gruffydd ap Cynan (1081–1137) was able to rebuild from humble beginnings the edifice overthrown by Henry's father and brother. No sooner was the King's hand removed by death than a revolt broke out against the foreign power, in which the leaders were Gruffydd's sons, Owain and Cadwaladr, backed by the renewed strength of Gwynedd. The reign of Stephen marks a general revival of energy among the Welsh, who profited to the full by the English civil war; Gwynedd, Powys and Deheubarth became strong principalities under the respective leadership of Owain Gwynedd (1137–1170), Madog ap Maredudd (1132–1160) and Rhys ap Gruffydd (1155–1197). It was thus a hard task which Henry II. had before him when he strove in Wales, as elsewhere, to re-establish the conditions of his grandfather's rule; temporary success against Owain in 1157 and against Rhys in 1163 was followed by virtual defeat in 1165,

when storms drove him back from the Berwyn moorlands before he had encountered the united forces of the Welsh. The Becket quarrel and his Irish schemes induced him to reconsider his policy; he now resolved upon an alliance with Rhys ap Gruffydd, whom events had made not only master of most of South Wales, but also beyond question the leading Welsh prince. The pact between Henry and Rhys, concluded in September, 1171, was observed until the King's death and bore fruit in the assistance given by the Welsh to the crown in the rebellion of 1173–74. Bard and chronicler alike sound the praises of "the Lord Rhys," who is also well known from the writings of his relative, Gerald of Barry (Giraldus Cambrensis). The authentic history of the Eisteddfod begins with the festival he held in Cardigan in 1176; he was also the liberal patron of the Cistercian movement, and supported Archbishop Baldwin, when in 1188 he made a tour of Wales to preach the crusade.

The Power of Gwynedd.—After Rhys's death, the primacy of Wales reverted to Gwynedd. A grandson of Owain, Llywelyn ab Iorwerth (1194–1240), ousted his rivals in that district and proved his quality by the capture of Mold from the English (1199). He had two external opponents to fear, the ruler of Southern Powys and the English king. From Gwenwynwyn (1195–1216) he wrested his dominions and, with Northern Powys in vassalage, he remained arbiter of North Wales until his death. John was, at first, friendly, but the inevitable struggle came in 1211, and, having survived this ordeal, Llywelyn was able to co-operate, first with the pope and then with the insurgent barons, in the humiliation of the King. His services were recognised in the Great Charter and he profited by the situation to carry his arms into South Wales, where he became overlord of the descendants of the Lord Rhys and aided them in the destruction of Norman castles. Under Henry III., he was one of the magnates of the English realm, wedded to a half-sister of the King, an ally of the feudal party, attacked in vain by Hubert de Burgh in 1228.

Llywelyn's son, David (1240–46), struggled to retain his father's position, but died before the issue was finally determined. He left no heir, and Gwynedd passed to his young nephews, against whom Henry III. had no difficulty in asserting the royal power. In 1255, however, Llywelyn ap Gruffydd defeated his brothers at Bryn Derwin and prepared to repeat the triumphs of his grandfather. Seizing the opportunity afforded by the baronial revolt, he found himself lord in a few years of as wide a territory as his great namesake; even the fall of his ally, Earl Simon, did not check his progress, and by the Treaty of Montgomery (1267) he was recognized as Prince of Wales (the first official appearance of the title) and suzerain of the other Welsh chieftains. When Edward I. succeeded, he was at the height of his power, but, misjudging the situation, he soon lost all; resistance in 1277 led to the forfeiture of everything save Western Gwynedd and his title; a second rebellion in 1282 resulted in total overthrow and death in a chance encounter not far from Builth (December 11th).

The English Conquest.—In both his wars with Llywelyn the Last, Edward had won his victory by the use of sea power against Gwynedd. He had realized that it was only thus that Wales could be crippled, namely by a final blow at the vulnerable danger-spot. The dynasty was disposed of by the execution of David, Llywelyn's brother, in 1283. But it was in a quite limited sense that Wales was conquered at this time. Llywelyn's dominions were brought by the Statute of Rhuddlan (1284) under the direct rule of the crown; they were divided into counties, furnished with crown officials and protected by new castles and boroughs at Caernarvon, Conway, Beaumaris, Criccieth, and Harlech. But the old marcher lordships, baronial preserves where the lords ruled as little kings and royal writs did not run, were not interfered with; indeed, their number was increased and new franchises arose around Denbigh, Ruthin, Wrexham and Chirk. Even the loyalist princes of Powys and the Vale of Towy were left undisturbed and among the smaller Welsh landowners the changes were far fewer than might have been supposed. Indeed, in many respects the new Wales differed little from the old. It was still a land of small, independent states, each governed by its own customs and inhabited by a Welsh-speaking population, among whom the old Welsh culture flourished. Edward was no friend to marcher privileges; in 1291 he brought the lords of Brecknock and Glamorgan to book for exercising the right of private war, and in 1301 he revived the principality of Wales in the person of his son, seemingly in order to create a Welsh authority which could bridle the barons. But tradition was more potent than the royal will; under the weak rule of Edward II., Wales became the battleground of baronial factions and, when Edward III. in 1343 again created a Prince of Wales, it was with a less ambitious purpose; the Black Prince was hardly more than the chief Welsh landlord, the master of Welsh archers and lancemen who fought with distinction under him at Crécy and Poitiers.

There had been revolts of the Welsh under Rhys ap Maredudd of Dryslwyn (1287), Madog ap Llywelyn of Meirionydd (1294) and Llywelyn Bren of Senghenydd (1316). But, in the course of the fourteenth century, resistance died down; even Anglesey, that ancient focus of liberty, produced defenders of the crown such as the Penmynydd family, ancestors of the Tudors, and Sir Hywel of the Horseshoes, men who never forgave the murderers of Edward II. The country was growing more prosperous; market towns came into existence, the abundance of wool led to the making of Welsh frieze, and a thriving trade sprang up at ports like Rhuddlan, Beaumaris, Haverfordwest and Carmarthen. It is, therefore, startling to find, at the opening of the fifteenth century, Wales convulsed by a new revolt, more formidable and widespread than any of its predecessors.

Owain Glyn Dwr was the direct male representative of the line of Northern Powys, with claims through his mother to the lands of the Lord Rhys. At the accession of Henry IV., he held a portion of this inheritance on the banks of the Dee and of the Teify. When in 1400 he broke into rebellion, it was mainly to vindicate personal wrongs. But Henry underestimated both the hereditary prestige and the high abilities of this warrior of courage and genius, with the result that Owain's power grew from year to year and he was ere long emboldened to proclaim himself independent prince of Wales. The capture of his enemy Reginald Grey gave him financial resources, that of Edmund Mortimer a valuable ally. He concluded a treaty with Charles VI. of France, won the castles of Harlech and Aberystwyth, held parliaments of his subjects, and exercised in a large part of Wales the powers of a ruling prince. The downfall of his friends, the Percys, at Shrewsbury (1403) was not fatal to the movement; more serious was the failure of the French at Woodbury Hill (1405) and the loss of the two castles (1408). As the difficulties of Henry IV. gradually disappeared, Owain's cause became hopeless and he died in hiding in 1416. He has never ceased to be the darling hero of Welsh popular tradition.

The Glyn Dwr movement left Welsh society in ruins and during the rest of the century recovery was but slow. Disorder returned with the Wars of the Roses, in which Welshmen such as Owen Tudor (d. 1461) and William Herbert, earl of Pembroke (d. 1469), were deeply involved. It was a Tudor who at last brought peace alike to England and Wales on the field of Bosworth, with a large Welsh following who reckoned that they had avenged in this victory the wrongs of foreign rule.

HISTORY: II. 1485 TO THE PRESENT DAY

Political and Legal Changes.—With the Tudor dynasty firmly established certain constitutional changes intended to place Welsh subjects on a complete social and political equality with Englishmen have to be recorded. The Act of Union 1536 (27 Henry VIII.) converted the whole of the marches of Wales into shire ground, and also created five new shires: Denbigh, Montgomery, Radnor, Brecknock and Monmouth. At the same time, remaining lordships were added to the existing Welsh shires of Cardigan, Carmarthen, Glamorgan and Pembroke, to the further

enlargement of their boundaries. Clause 26 of the same act likewise decreed that the 12 Welsh shires should return 24 members to the English parliament; one for each shire, and one for the boroughs in each shire (except Merioneth), and one for the town and county of Haverfordwest. It is probable that Welsh members attended the parliaments of 1536 and 1539, and it is certain that they were present at the parliament of 1541 and every parliament subsequently held. This Act of Union was followed in 1542 by an "Act for certain Ordinances in the King's Majesty's dominion and Principality of Wales" (34 and 35 Henry VIII.), which placed the court of the president and council of Wales and the marches on a legal footing. This court, with a jurisdiction akin to that of the Star Chamber, had originally been set up under Edward IV. with the object of suppressing private feuds and other illegalities amongst the lords-marcher and their retainers. The council of Wales, with its headquarters at Ludlow, undoubtedly did good service on behalf of law and order under such capable presidents as Bishop Rowland Lee and William Herbert, earl of Pembroke; but it had become an obsolete engine of oppression by the time of the Commonwealth, although it was not definitely abolished until the revolution of 1688. The act of 1542 also enacted that courts of justice under the title of "the king's great sessions in Wales" should sit twice a year in every county of Wales, except Monmouth, which was thus formally declared an English shire. For this purpose four circuits, two for North and two for South Wales, were created; whilst justices of the peace and lords-lieutenant for each shire were now appointed. At the same time, all ancient Welsh laws and customs, which were at variance with the recognized law of England, were now declared illegal, and the old Cymric tenure by gavelkind, which had been respected by Edward I., was expressly abolished and its place taken by primogeniture. It was also enacted that all legal procedure must henceforth be conducted in English, an arrangement that fell very heavily on poor monoglot Welshmen and a curiously ungracious measure from a Welsh-born sovereign. Under this system of the great sessions justice was administered throughout the 12 shires of Wales for nearly 300 years, and it was not until 1830 that these Welsh sessions were abolished (not without some protest from Welsh members at Westminster), and the existing North and South Wales circuits were brought into being.

The Welsh Bible.—With the peaceful absorption of the principality into the realm of the Tudors, the subsequent course of Welsh history assumes mainly a religious and educational character. As early as the reign of Henry VIII. there were to be found at court and in the universities a number of ardent and talented young Welshmen, adherents mostly of the reforming party in Church and State, who were destined to bring about a brilliant literary revival in their native land. Of this distinguished band the two most memorable names are those of Bishop Richard Davies (*c.* 1501–1581), and of William Salesbury, the scholar-squire of Llanrwst (*c.* 1520–1600) in Denbighshire, who is commonly accounted the author of the first printed book in the Welsh language, a small volume of proverbs with the title "Oll Synnwyr pen Kembero," printed in London in or about 1545. With the accession of Elizabeth a vigorous ecclesiastical policy on truly national lines was now started in Wales itself, chiefly through the influence of Richard Davies, then bishop of St. Davids, who was doubtless responsible for the act of parliament of 1563 which charged the bishops of St. Davids, Bangor, Llandaff, St. Asaph and Hereford to prepare with all speed for public use Welsh translations of the Scriptures and the Book of Common Prayer. Of the five prelates thus named, Davies alone was competent to perform the allotted task, and for assistance in his work of translation he summoned his old friend and former neighbour, William Salesbury. The pair laboured together at Abergwili palace, near Carmarthen, with such diligence that before the close of 1567 the Welsh translations of the Liturgy and the New Testament were published in London; the Liturgy being the exclusive work of Bishop Davies, whilst the New Testament was translated by Salesbury, with the exception of certain epistles from the pen of the bishop and the Book of Revelation, which was contributed by Thomas Huet (d. 1581), precentor of St. David's cathedral. But the honour of presenting his countrymen with a complete Welsh translation of the Bible was reserved for William Morgan (*c.* 1547–1604), vicar of Llanrhaidar-yn-Mochnant in Denbighshire, and afterwards bishop successively of Llandaff and of St. Asaph. For eight years Morgan was busied with his self-imposed task, being greatly helped and encouraged thereto by Archbishop Whitgift, by Bishop William Hughes (d. 1600) of St. Asaph, and by other leading dignitaries of the Church. In Dec. 1588 the first complete Welsh Bible was issued from the royal press at Westminster under the patronage of queen and primate, some 800 to 1,000 copies being supplied for distribution, to be read in all the parish churches of Wales. This famous *editio princeps* of the Welsh Bible was supplanted later under James I. by the Authorized Version, translated by Bishop Richard Parry (1560–1623) of St. Asaph, with the help of Dr. John Davies of Mallwyd (1570–1644), the first great Welsh lexicographer. At the tercentenary of "Bishop Morgan's Bible," in 1888, a memorial cross was erected in the cathedral close of St. Asaph in order to perpetuate the names and services of the eight leading Welsh translators: Bishops Davies, Morgan and Parry; William Salesbury; Thomas Huet; Dr. John Davies of Mallwyd; Archdeacon Edmund Prys (1541–1624), author of a popular Welsh metrical version of the Psalms; and Gabriel Goodman, dean of Westminster (1528–1601), a native of Ruthin, who had greatly assisted Bishop Morgan in the work of printing and editing.

These translations of the Bible and Liturgy definitely fixed the standard of classical Welsh.

Puritanism and the Civil Wars.—The growth of Puritanism in Wales, where the people still clung largely to Catholic tradition, was neither strong nor speedy, although the year 1588 (which saw the publication of Bishop Morgan's Bible) gave birth to two fierce appeals to parliament, urging a drastic puritanical policy in Wales, from the pen of the celebrated John Penry, a native of Brecknock (1559–1593). Far more influential than Penry were Rhys Prichard (? 1579–1644), the famous vicar of Llandovery, Carmarthenshire, and William Wroth (d. 1642), the puritan rector of Llanfaches, Monmouthshire. Of these two divines, Vicar Prichard, who was essentially orthodox, forms an interesting connecting link between the learned Elizabethan translators and the great revivalists of the 18th century, and his moral rhymes in the vernacular, collected and printed after his death under the title of *The Welshman's Candle* (Canwyll y Cymry), still retain some degree of popularity. Prichard rose to become chancellor of St. David's cathedral; but the indiscreet Wroth, "the founder and father of nonconformity in Wales," being suspended in 1638 by Bishop Murray of Llandaff, founded a small community of Independents at Llanfaches, which is thus commonly accounted the first dissenting chapel in Wales. The effects, however, of the great literary revival of Elizabeth's reign were by no means exhausted, for during this period Wales certainly possessed many native divines who were at once active parish priests and good scholars, many of them having been educated at Jesus college, Oxford, the Welsh college endowed by Dr. Hugh Price (d. 1574) and founded under Elizabeth's patronage in 1573. So striking was the devotion shown throughout the principality to Charles I., who fought his last disastrous campaigns in the friendly counties of Wales and the marches, that on the final victory of the Parliament there was passed within a month of the king's execution (perhaps as a special measure of punishment) an "Act for the Better Propagation and Preaching of the Gospel in Wales," by the terms of which a packed body of 70 commissioners was given practically unlimited powers to deal with all matters ecclesiastical in Wales. To assist these commissioners in their task of enquiry and ejectment, a body of 25 "approvers" was likewise constituted, with the object of selecting itinerant preachers to replace the dismissed incumbents. Some 330 out of a possible total of 520 incumbents were ejected in St. David's and Llandaff, and there is every reason to suppose that the beneficed clergy of Bangor and St. Asaph suffered equally. A monster petition of protest, signed alike by moderate Puritans and by High Churchmen, was prepared for presentation to parliament in 1652 by Col. Edward Freeman, the attorney-general for South Wales. Despite the fierce efforts of

Vavasor Powell and his friends to thwart the reception of this petition at Westminster, Col. Freeman was able to urge the claims and complaints of the petitioners, or "anti-propagators" as they were termed, at the bar of the House of Commons, openly declaring that by the late policy of ejectment and destruction "the light of the Gospel was almost extinguished in Wales." At the Restoration all the ejected clergy who survived were reinstated in their old benefices under the Act of Uniformity of 1662, whilst many Puritan incumbents were in their turn dismissed for refusing to comply with various requirements of that act. Amongst these latter, Stephen Hughes of Carmarthen (1623–1688), a devoted follower of Vicar Prichard and an editor of his works, was ejected from his living of Mydrim in Carmarthenshire, whereby the valuable services of this eminent divine were gained by the Nonconformists, whose numbers had increased since the Civil Wars. The old Church policy on national lines, begun by Elizabeth and productive of so much good work in Wales, was now gradually relaxed under the later Stuarts, and definitely abandoned under their Hanoverian successors. Thus the Church, which had so long played a valuable and prominent part in the moral and intellectual progress of the Welsh people, was slowly forced out of touch with the nation through the inaction of non-resident and unsympathetic Whig prelates in Wales itself, which still remained largely High Church and Jacobite in feeling.

Popular Education and the Methodist Revival.—All contemporary writers agree that the mass of the Welsh people at the close of the 17th century were illiterate. English was little understood or spoken amongst the rural population, and there was a marked dearth of Welsh educational books. Some efforts to remedy this dark state of things had already been made by Thomas Gouge, with the assistance of Stephen Hughes, and also by the newly-founded Society for the Promotion of Christian Knowledge. But it was Griffith Jones (1683–1761), rector of Llanddowror in south Carmarthenshire, who was destined to become the true pioneer of Welsh education, religious and secular. Early in the reign of George I. this excellent man, whose name and memory will ever be treasured in Wales, began a system of catechizing in the vernacular among the children and adults of his own parish. With the help of Sir John Philipps (d. 1736), of Picton castle, and Mrs. Bridget Bevan of Laugharne (d. 1779), who is still affectionately remembered in Wales as the pious donor of "Madam Bevan's charity," Griffith Jones was enabled to extend his scheme of popular education throughout South Wales, where numerous "circulating charity schools," as they were called, were set up in rural parishes with the approval of their incumbents. The results obtained by the development of these schools were speedy and successful beyond the wildest hopes of their founder. This novel educational system in 1760 numbered 215 schools, with a total number of 8,687 scholars; and by the date of Jones's death, in 1761, over 150,000 persons of every age and of either sex—nearly a third of the whole population of Wales at that date—had been taught to read the Scriptures in their own language by means of these circulating schools. With this newly acquired ability to read the Bible, the many persons so taught were not slow to express a keen demand for Cymric literature, which was met by a supply from local presses in Wales. The success, in fact, of the Welsh circulating schools created the Welsh vernacular press.

Meanwhile, the writings and personal example of the pious rector of Llanddowror were stirring other Welshmen in the work of revival, chief amongst them being Howell Harris of Trevecca (1713–1773), a layman of brilliant abilities but of erratic temperament, and Daniel Rowland (1713–1790), curate of Llangeitho in Cardiganshire, who soon became the most eloquent and popular preacher in all Wales. Two other clergymen who figure prominently in this Methodist movement and whose influence has proved lasting were Peter Williams of Carmarthen (1722–1796), the Welsh Bible commentator, and William Williams of Pantycelyn (1717–1791), the celebrated Welsh hymn-writer.

The Methodist Secession.—During the lifetime of Griffith Jones the course of Welsh Methodism had run in orthodox channels, and had been generally supported by the Welsh clergy and gentry. But after 1761 the tendency to exceed the bounds of conventional Church discipline grew so marked as to excite the alarm of the English bishops in Wales. Yet the bulk of the Methodists continued to receive the Sacraments from regularly ordained parish priests, although a schism was threatened. Towards the close of the 18th century the Methodist revival spread to North Wales, through the influence of the celebrated Thomas Charles, commonly called Charles of Bala (1755–1814), formerly curate of Llanymawddwy and founder of Welsh Sunday schools. Relations rapidly grew strained between the English rulers of the Church and the Methodists, and in 1811 the long-expected schism took place, much to the regret of Charles himself, who had ever professed himself a devoted disciple of Griffith Jones. The bulk of the farming and labouring members of the Church definitely seceded from their "ancient mother," to whom, however, the Welsh gentry still adhered.

An honourable exception to the absentee or indifferent English prelates of this period is to be found in Thomas Burgess, bishop of St. David's, to whose exertions is mainly due the foundation of St. David's college at Lampeter, an institution erected to provide a better and cheaper education for intending young Welsh clergymen. It was not until 1870 that, by Gladstone's appointment of Dr. Joshua Hughes to the see of St. Asaph, the special needs and claims of the Welsh Church were officially recognized.

Thus, between 1811 (the year of the Methodist secession) and 1832 (the date of the Reform bill), the number of dissenting chapels had risen from 945 to 1,428. As the franchise was lowered, radicalism asserted itself. In 1870, the dissenting bodies were supporting two quarterly, six monthly and ten weekly papers, all published in the vernacular. A result was the Sunday Closing Act of 1881 and the Welsh Intermediate Education Act of 1889. In 1893 Lord Rosebery's cabinet appointed the Welsh Land Tenure Commission, whose report, published in 1896, did much to exonerate the squirearchy from charges of extortion and sectarian oppression. Sir H. Campbell-Bannerman's cabinet appointed the Welsh Church Commission (June 21, 1906), to enquire into the temporalities of the Welsh Dioceses. The report was published on Dec. 2, 1910.

In 1914, the Church question, which had been the pivot of Welsh politics ever since 1868, was finally settled by the Act for the Disestablishment and Disendowment of the Church in Wales; but owing to the World War, the act itself was not put into operation until April 1, 1920. By that date, a governing body, formed on elective principles and consisting of the three orders of the Welsh bishops, clergy and laity, had been called into being with a carefully drawn constitution, and at its first meeting at Llandrindod Wells in April 1920 this body unanimously confirmed the election, by the Welsh bishops, of Bishop Edwards of St. Asaph as first archbishop of Wales. Since 1920 two more Welsh bishoprics have been formed—Monmouth in 1921, and Swansea-and-Brecon in 1923.

Other Movements.—In the Rebecca Riots (*q.v.*) of 1843 in South Wales many toll-gates were destroyed by mobs of country men disguised in female garb as "the daughters of Rebecca about to possess the gates of their enemies." In 1885–86 the anti-tithe agitation—largely traceable to the violent language about clerical tithe employed by certain organs of the vernacular press—led to some disorderly scenes between the distraining police and the country folk, especially in the Cardigan district. That peculiar movement of religious enthusiasm known as a revival (*diwygiad*) has occurred from time to time, notably in 1859 and 1904.

Educational Progress.—The University college of Wales was founded at Aberystwyth in 1872; that of South Wales at Cardiff in 1883; of Bangor in 1884; and of Swansea in 1920. In Nov. 1893 the constituent colleges were incorporated by royal charter as the University of Wales, with Lord Aberdare (d. 1895) for its first chancellor. In 1907 the creation of a Welsh department of the Board of Education admitted the special claims of the Welsh language in the schools. In July 1911, shortly after the investiture by King George V. of the prince of Wales at Carnarvon castle with much pomp, the foundation stone of the National Library of Wales was laid by the King at Aberystwyth; and since

that date the National Library has acquired a world-wide reputation. In April 1927 the splendid buildings of the National Museum of Wales were formally opened by the King at Cardiff.

A Welsh commission was made responsible for the administration in Wales of the National Health Insurance Act (1913). Under the same act the campaign against tuberculosis was entrusted to the King Edward VII. (Welsh) National Memorial Association. Under the Preservation of Ancient Monuments Act (1913) Wales possesses its own board of representatives.

In the National Eisteddfod (*q.v.*), revived in the middle of last century and held every August at some important centre of North or South Wales alternately, the most fervent element of Welsh nationalism is to be found; whilst local *eisteddfodau* are by no means confined to the Welsh-speaking areas. A departmental committee to inquire into the question of the Welsh language issued its report in Aug. 1927.

(H. M. V.)

WALEWSKI, ALEXANDRE FLORIAN JOSEPH COLONNA, COMTE (1810–1868), French politician and diplomatist, was born at Walewice near Warsaw on May 4, 1810, the son of Napoleon I. and his mistress Marie, Countess Walewski. At fourteen Walewski refused to enter the Russian army, escaping to London and thence to Paris, where the French government refused his extradition to the Russian authorities. Louis Philippe sent him to Poland in 1830, and he was then entrusted by the leaders of the Polish revolution with a mission to London. After the fall of Warsaw he took out letters of naturalization in France and entered the French army, seeing some service in Algeria. In 1837 he resigned his commission and began to write for the stage and for the press. The accession of Louis Napoleon to the supreme power in France guaranteed his career. He was sent as envoy extraordinary to Florence, to Naples and then to London, where he announced the *coup d'état* to Palmerston (*q.v.*). In 1855 Walewski succeeded Drouyn de Lhuys as minister of foreign affairs, and acted as French plenipotentiary at the Congress of Paris next year. When he left the Foreign Office in 1860 it was to become minister of state, an office which he held until 1863. Senator from 1855 to 1865, he entered the Corps Législatif in 1865, and was installed, by the emperor's interest, as president of the Chamber. A revolt against his authority two years later sent him back to the Senate. He died on Oct. 27, 1868.

WALKER, FRANCIS AMASA (1840–1897), American soldier and economist, was born in Boston, Mass., on July 2, 1840. His father, Amasa Walker (1799–1875), was also a distinguished economist whose principal work, *The Science of Wealth*, attained great popularity as a textbook. Francis Walker graduated at Amherst college in 1860, studied law and fought in the Northern army during the whole of the Civil War, being a prisoner in the famous Libby prison, Richmond. After the war he became editorial writer on the Springfield, Mass., *Republican*, and in 1869 was made chief of the Government bureau of statistics. He was superintendent of the ninth and tenth censuses (those of 1870 and 1880), and (1871–72) commissioner of Indian affairs. From 1873 to his death his work was educational, first as professor (1873–81) of political economy in the Sheffield scientific school at Yale, and then as president of the Massachusetts Institute of Technology, Boston. In other fields he promoted common-school education (especially in manual training), the Boston park system, and the work of the public library, and took an active part in the discussion of monetary, economic, statistical and other public questions. As an author he wrote on governmental treatment of the Indians, *The Wages Question* (1876), *Money* (1878), *Land and its Rent* (1883), *General Political Economy* (1883–84), and various other works. As an economist, from the time of the appearance of his book on the subject, he so effectively combated the old theory of the "wage-fund" as to lead to its abandonment or material modification by American students; while in his writings on finance, from 1878 to the end of his life, he advocated international bimetallism. He died in Boston Jan. 5, 1897.

See James Phinney Munroe, *A Life of Francis Amasa Walker* (1923).

WALKER, FREDERICK (1840–1875), English subject painter, the son of a designer of jewellery, was born in Marylebone, London, on May 24, 1840. His earliest book illustrations appeared in 1860 in *Once a Week*. In the *Cornhill Magazine*, his illustrations to Thackeray's *Adventures of Philip* and *Denis Duval*, are spirited works. He was elected an associate of the Society of Painters in Water Colours in 1864 and a full member in 1866; and in 1871 he became an associate of the Royal Academy and an honorary member of the Belgian Society of Painters in Water Colours. His first oil picture, "The Lost Path," was exhibited in the Royal Academy in 1863. In 1871 he exhibited his tragic life-sized figure of "A Female Prisoner at the Bar," a subject which now exists only in a finished oil study, for the painter afterwards effaced the head and was prevented by death from again completing the picture. On June 5, 1875 he died of consumption at St. Fillan's, Perthshire.

See G. Marks *Life and Letters of Frederick Walker, A.R.A.*, (1896); *Frederick Walker and his Works*, by Claude Phillips (1897).

WALKER, GEORGE (*c.* 1618–1690), hero of the siege of Londonderry, son of George Walker, rector of Kilmore and chancellor of Armagh (d. 1677). In the Irish war of 1688, Walker, though in Holy Orders and advanced in years, raised a regiment and endeavoured to concert measures with Robert Lundy, the acting governor of Londonderry, for the defence of Dungannon who, however, ordered the abandonment of the place on March 14, 1689.

On the approach of the enemy (April 13) Walker hurried to Londonderry to inform Lundy, but was unable to convince him of his danger. He returned to his men at Lifford, where, on the 14th, he took part in a brush with the enemy, afterwards following the retreat of the army to Londonderry. The town was in great confusion, and Walker found the gates shut against him and his regiment. He was forced to pass the night outside, and only entered the next day "with much difficulty and some violence upon the Centry." Immediately on his arrival he urged Lundy to take the field and refused the demand to disband his own soldiers. On the 17th of April Lundy determined to give up the town to James, and called a council from which Walker and others were especially excluded; but the next day the king and his troops, who had advanced to receive the surrender, were fired upon from the walls contrary to Lundy's orders, and the arrival of Captain Adam Murray with a troop of horse saved the situation. Lundy was deprived, and allowed to escape in disguise. On April 19 Walker and Baker were chosen joint-governors. Walker commanded fifteen companies, amounting to 900 men, and to him was also entrusted the supervision of the commissariat. He showed great energy, courage and resource throughout the siege, and led several successful sallies. At the close of the siege, which lasted 150 days, the town was at the last extremity; but at length, on July 30, Walker preached the last of the sermons by which he had helped to inspire its defence. An hour afterwards the ships were seen approaching, and the town was relieved.

Walker was received by William and Mary at Hampton court on Aug. 9, and presented with £5,000, part of which he appears to have given to Baker's widow. He was nominated to the bishopric of Londonderry, but was shot at the Boyne (July 1, 1690).

While in London Walker had published *A True Account of the Siege of Londonderry* (1689), dedicated to the king, which went through several editions and was translated for perusal abroad.

In the *Siege of Derry* (1893) the Rev. Philip Dwyer has collected

the most essential facts and materials relating to Walker and the siege, and has reprinted in his volume Walker's *True Account* and *Vindication*, together with Walker's sermons, various other documents and valuable notes.

WALKER, HENRY OLIVER (1843–1928), American artist, was born at Boston (Mass.) on May 14, 1843. He was a pupil of Léon Bonnat, Paris, and painted the figure and occasional portraits, but later devoted himself almost exclusively to mural decoration. His paintings, symbolizing lyric poetry, for the Congressional library, Washington, and his decorations for the Appellate Court house, New York city, the enlarged State house, Boston, the Court house, Newark (N.J.) and the Capitol at St. Paul (Minn.), are among his most important works. He died in Belmont (Mass.) on Jan. 14, 1928.

WALKER, HORATIO (1858–), American artist, was born at Listowel, Ontario, Canada, May 12, 1858. When he was a child his family settled at Rochester, N.Y. Although entirely self-taught, he became a distinguished painter of animals, the figure and landscape. His pictures, principally of Canadian peasant life and scenes, show the influence of Troyon and Millet, mainly in their feeling for largeness of composition, in solidity of painting and in the choice of themes. He became a member of the National Academy of Design, New York, in 1891; of the American Water Color Society, and of the Royal Institute of Painters in Water Colours, London.

WALKER, OBADIAH (1616–1699), master of University College, Oxford, born at Darfield near Barnsley, Yorkshire, was educated at University College, Oxford, becoming a fellow and tutor. In 1648 he was deprived of his academic appointments, but he returned to Oxford at the restoration of 1660. In June 1676 he was elected to the headship of this foundation. After the accession of James II. he declared himself a Catholic, being partly responsible for the tactless conduct of James in forcing a quarrel with the fellows of Magdalen College. Mass was said in his residence, and later a chapel was opened in the college for Roman worship. He died on Jan. 21, 1699.

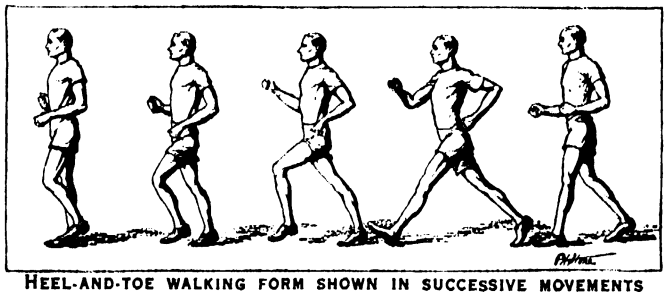
WALKER, ROBERT (d. *c.* 1658), British painter, was a contemporary and to a slight extent a follower of Van Dyck. The date of his birth is uncertain, and no details are known of his early life. His greatest vogue was at the time of the Commonwealth, for in addition to several portraits of Cromwell he painted others of Lambert, Ireton, Fleetwood, and many more members of the Parliamentarian party. In 1652 he was given rooms in Arundel House in the Strand, London, where he resided for the rest of his life. He died either in 1658 or in 1660, the authority for the earlier date being an inscription on an engraved portrait by Lombart. His work was vigorous and showed sound study of character. Several of his paintings, among them the portrait of William Faithorne the elder, are in the National Portrait Gallery, and there are others of notable importance at Hampton Court and in the University galleries at Oxford. One of his portraits of Cromwell is in the Pitti Palace, where it is ascribed to Lely. Another is at Warwick castle.

WALKER, ROBERT JAMES (1801–1869), an American lawyer, economist, statesman and financial expert, probably rendered his greatest public service when as secretary of the Treasury under President Polk he proposed, during the summer of 1845 while the Oregon question endangered Anglo-American relations, a reduction of the American tariff in anticipation of the repeal of the British Corn Laws. His treasury report of Dec. 3 was a masterly presentation of the situation, and has been regarded as the most powerful attack upon the protective system ever made in an American State paper. He practically formulated and secured the passage of the "revenue" Walker Tariff Act of 1846 in conjunction with the repeal of the Corn Laws in Great Britain, while the Oregon question, which had thus been forced into a position of secondary importance, was "amicably" settled. Consequently, during the next 15 years before the outbreak of the Civil War (1861), Anglo-American commercial and investment and political and social relations grew into a bond rivalling that which had already developed between Lancashire and the cotton-growing South, while the grain-growing North-west became an element of strength in the struggle for the Union.

After the close of Polk's administration (1849), Mr. Walker became an agent in England for the Illinois Central railroad, a company in which Richard Cobden and some of his friends became deeply interested; and during the Civil War, as the agent of S. P. Chase, secretary of the Treasury, did valuable work in Great Britain and Germany, destroying the credit of the Confederate States in the former, and borrowing $250,000,000 in the latter. Mr. Walker's political career had begun during the nullification excitement of 1832–33, when at Natchez, Miss., on the first Monday of Jan. 1833, he delivered an able Union speech which attracted President Jackson's support and led to his election to the U.S. Senate on Jan. 8, 1836. As an ardent expansionist, he advocated the recognition of the republic of Texas (1837), took a leading part in the movement for annexation, and at one time during the war with Mexico wanted to acquire all of that country; but in the case of Orêgon, while ostensibly supporting President Polk in a bold stand, he took the action mentioned above and offered no opposition to acceptance of the 49th parallel. In 1867–68 he rounded out his expansionist career by assisting with great profit to himself in the Russian sale of Alaska to the United States. As a constructive statesman, he was an important factor in the reorganization of the American treasury system during the 'forties, financed the war with Mexico, and advocated and drafted the bill (1849) for the establishment of the Department of the Interior. He was appointed territorial governor of Kansas in the spring of 1857 by President Buchanan, but in November of the same year resigned in disgust over the Lecompton constitution. From the beginning of his career he had been consistently opposed to slavery, but favoured gradual rather than immediate emancipation and as early as 1838 had freed his own slaves. Mr. Walker was, indeed, more Northern than Southern in his general inclinations. He was born, reared and educated in Pennsylvania, and he graduated with honours in the University of Pennsylvania (1829).

There is no biography of Robert J. Walker; but *see* sketches in *The Granite Monthly*, XII. 90–91; *The Green Bag*, XV. 101–106; and the detailed American histories covering the period of his life.

WALKER, WILLIAM (1824–1860), American adventurer, was born in Nashville, Tenn., on May 8, 1824. He graduated at the University of Nashville in 1838, and in 1843 received his M.D. from the University of Pennsylvania. Later he studied law and was admitted to the bar in New Orleans. On Oct. 15, 1853, he sailed from San Francisco with a filibustering force for the conquest of Mexican territory. He landed in Lower California, and on Jan. 18, 1854, he proclaimed this and the neighbouring State of Sonora an independent republic. Starvation and Mexican attacks led to the abandonment of this enterprise, and Walker resumed his journalistic work in California. On May 4, 1855, with 56 followers, Walker sailed for Nicaragua, where he had been invited by one of the belligerent factions to come to its aid. In October Walker seized a steamer on Lake Nicaragua belonging to the Accessory Transit Company, a corporation of Americans engaged in transporting freight and passengers across the isthmus, and was thus enabled to surprise and capture Granada and to make himself master of Nicaragua. Peace was then made; Patricio Rivas, who had been neutral, was made provisional president, and Walker secured the real power as commander of the troops. At this time two officials of the Accessory Transit Company determined to use Walker as their tool to get control of that corporation, then dominated by Cornelius Vanderbilt. They advanced him funds and transported his recruits from the United States free of charge. In return Walker seized the property of the company, on the pretext of a violation of its charter, and turned over its equipment to the men who had befriended him. On May 20, 1856, the new government was formally recognized at Washington by President Pierce. Walker managed to maintain himself against a coalition of Central American States, led by Costa Rica, which was aided and abetted by agents of Cornelius Vanderbilt, until May 1, 1857, when, to avoid capture by the natives, he surrendered to Commander Charles Henry Davis, of the U.S. Navy, and returned to the United States. In Nov. 1857



he sailed from Mobile with another expedition, but soon after landing at Punta Arenas he was arrested by Commander Hiram Paulding of the American Navy, and had to return to the United States as a prisoner on parole. On his arrival he was released by order of President Buchanan. After several unsuccessful attempts to return to Central America, Walker finally sailed from Mobile in Aug. 1860 and landed in Honduras. Here he was taken prisoner by Capt. Salmon, of the British Navy, and was surrendered to the Honduran authorities. He was executed Sept. 12, 1860.

See Walker's own narrative, accurate as to details, *The War in Nicaragua* (Mobile, 1860); also William V. Wells, *Walker's Expedition to Nicaragua* (1856); Charles William Doubleday, *Reminiscences of the "Filibuster" War in Nicaragua* (1886); James Jeffrey Roche, *The Story of the Filibusters* (1891), revised and reprinted as *Byways of War* (1901); and William O. Scroggs, *Filibusters and Financiers* (1916). (W. O. S.)

WALKING, the art of progression by setting one foot methodically before the other, is the most venerable and universal way of locomotion among mankind, and has been for a million years. Walking in the nobler sense is a measured progress inspired by the woods and hills, by rivers and the flowers of the field, a serene partaking of the enduring sources of joy. Walking conduces to meditation. Or perhaps it should be said that only those of philosophic spirit truly walk, receptive of the beauty which is everywhere in nature unmarred by man. Walking and meditative thought are bound together in the very name Peripatetic. As they walked they pondered, and as they pondered they walked. When the father of Chryseis walked silent along the shore of the much-resounding sea, he was inspired to seek aid of the lord of the silver bow, thereby recovering his beloved daughter. In the Orient, land of innumerable pilgrims, serene walking and worthy thinking go together. A *Sutta* tells us how the Buddha, descending from Vulture peak, came to the verge of the lotus lake where the peacocks were fed, and walked to and fro taking the air on the lawn of the peacocks.

Walking in the finest sense is for joy. It is notable that an early example of one who walked because he preferred to walk is Paul of Tarsus. He was on his way for the last time to Jerusalem, having come by boat from Philippi to the Troad. Then he sent his company by ship around the peninsula to Assos, "for so had he appointed, minding himself to go afoot."

Walking for love of a noble form of exercise, to enjoy the companionship of natural beauty, is hardly known in the classics. Xenophon and his companions trudged sturdily, but not for pleasure. Cicero has much to say, in the dialogue concerning *Old Age,* of the happiness of walking in a garden or among trellised vines, but we must await another age for the right celebration of the Euganean hills. So through the middle ages. There were roads and men traversed them, but the Canterbury pilgrims journeyed on horseback. Goldsmith, in *The Traveller,* records

HEEL-AND-TOE WALKING FORM SHOWN IN SUCCESSIVE MOVEMENTS

an inspiring tour through storied lands, but his mood was melancholy and friendless; nor is it recorded that he found solace afoot among the fields and woods of England. Rousseau is a more convinced walker. "What I most regret," he says, "is that I kept no records of my journeyings. Never have I thought so much, existed so much, lived so much, been so much myself, if I may dare to say it, as when I went alone and afoot." Long-legged Thomas Carlyle was a mighty walker, and he often went alone, given up to reflection in the silence of the moors and hills. Going forth in the white of the dawn from Muirkirk, where Duneaton water crosses the border of Ayr, he made his way through the heather of the Lowther hills, coming by nightfall to Dumfries, a good four and fifty miles. Wordsworth was untiring. His friend De Quincey held that with those identical legs Wordsworth must have traversed a distance that would have taken him seven times around the world, adding that to this mode of exertion "he was endebted for a life of unclouded happiness, and we for much of what is most excellent in his writings."

Walking merges into mountain climbing. The countrymen of Wordsworth have scaled notable peaks. James Bryce may stand as the type of these vigorous islanders, whether he was striding up Mount Ararat, or gaining a summit of the Basuto hills, or sturdily threading the trails of the New Hampshire uplands. Hudson holds a high place among famous walkers. The uplands and moors and beech woods of England, the stern reaches of Cornwall, live and breathe in his books.

Emerson's Monadnock journey is notable, but Thoreau is the best of American walkers and the worthiest recorder of the enduring worth of walking. His wandering through the White mountains, when he saw the pine grosbeaks, breathes the spirit of the ancient hills. The pilgrimage along Cape Cod is good history and excellent writing. The ascent of Katahdin carries the fragrance of primeval woods. Even more characteristic of his spirit are the walks about his own Concord, for which he has wrought an enduring monument.

WALKING RACES, an athletic sport, on road or track. These enjoyed a greater popularity in England than in any other country up to the time of the fourth Olympiad held in London in 1908. When the English championships were instituted in 1866 a 7m. walk was incorporated in the programme, the first title holder being J. G. Chambers, C.U.A.C., who covered the distance in 59mins. 32secs. Despite this initial success of a university athlete, walking races have never figured in the programme of the Oxford and Cambridge sports. In 1893 the English championship distance was reduced to 4m., but in 1901 the programme was again revised; the 4m. distance was reduced to 2m. and the 7m. walk was reinstated.

When the American championships were instituted in 1876 walking races were included at 1, 3 and 7m. The 7m. walk was dropped in 1878, replaced in 1879, dropped again in 1885, and again replaced in 1912. The 3m. was dropped in 1897 and resumed in 1907, while the 1m. walk survived until 1898, was restored in 1907 and finally abandoned in 1909.

Walking has never attained to any degree of popularity in the United States and there is no doubt that, once abandoned, the championship events would not have been revived but for the circumstance of the inclusion, for the first time, of walking races in the Olympic Games of London, 1908. This addition having been decided upon, American sportsmen set out to produce national champions as potential Olympic points scorers. The British dominions overseas, Denmark and Italy also began to take an interest in this form of athletics. Walking races at 3,500 metres (3,827yds.), and 10m. formed part of the Olympic programme in 1908. Both events were won by a Brighton policeman, G. E. Larner, with E. J. Webb, who had been both sailor and soldier, second. In the 3,500 metres, H. E. Kerr, Australasia, was third; G. Goulding, Canada, fourth; A. E. M. Rowland, Australasia, fifth; C. P. M. Westergaard, Denmark, sixth; and E. Rothman, Sweden, seventh. At the longer distance all six places were filled by representatives of Great Britain. The fifth Olympiad at Stockholm included only one walk, *i.e.,* 10,000 metres (6m. 376¼yds.). Goulding, Canada, won from Webb, Great Britain, in 46mins. 28⅘secs. This race was notable by the fact that A. Rasmussen, Denmark, finished third and F. Altimani, Italy, fourth. Neither of these men ever won an Olympic contest, but in 1913 Altimani achieved "noteworthy performances," not accepted as records, since there were only two time-keepers, at all distances from a half-mile in 3mins. 7secs., to 8m. in 57mins. 43⅘secs., while Rasmussen in 1918 set up world's records at 3,000 metres, 12mins. 53⅘secs.; 5,000 metres, 21mins. 59⅘secs.; 10,000 metres, 45mins. 26⅘secs.; and 15,000 metres, 1hr. 10mins. 23secs. At the seventh Olympiad, Antwerp, 1920, two walks were again included and

the growing fame of Italy was finally established by Ugo Frigerio, who won the 3,000 metres race from G. L. Parker, Australia, and R. F. Remer, U.S.A., in 13mins. 14⅕secs., and the 10,000 metres from J. B. Pearman, U.S.A., and C. E. J. Gunn, Great Britain, in 48mins. 6⅕secs. The 10,000 metres walk at Paris, 1924, was again won by Frigerio in 47mins. 49secs. from G. R. Goodwin, Great Britain, and C. C. McMaster, South Africa.

At the eighth congress of the I.A.A.F., 1927, America, Australia, Germany, Great Britain, Holland, Ireland, Italy and South Africa voted for the retention of walking as an Olympic event, while Austria, Finland, France, Greece, Hungary, Norway, Rumania, Sweden and Switzerland opposed the motion; the representatives of Belgium and Poland refrained from voting, and walking races were, therefore, deleted by 9 votes to 8.

In race walking almost all the athlete's muscles are active and few contests are more trying. Under the rules governing fair "heel and toe" walking the knee of the grounded leg must be locked and the walker must not lift the rear toe until the forward heel has touched the ground. In 1928 the records were:—

Race.	Time.	Winner.	Country.	Date.
	hrs. mins. secs.

WALKLEY, ARTHUR BINGHAM (1855–1926), English dramatic critic, son of Arthur Hickman Walkley, was born at Bristol on Dec. 17, 1855. He was educated at Warminster school, Balliol and Corpus Christi colleges, Oxford. In 1877 he entered the Post Office in a junior capacity, rising to become assistant secretary in 1911. He was dramatic critic to the *Star*, the *Speaker* and the *Times*.

His criticism was none the less serious for being shrewd and witty, and was given greater value by his determination "that his work was the creative art of letters not the writing of news." Two volumes have been published of his collected *Times* articles. He died at Brightlingsea, on Oct. 7, 1926.

WALL, RICHARD (1694–1778), diplomatist and minister in the Spanish service, belonged to a family settled in Waterford. Debarred from public service at home as a Roman Catholic, he served in an Irish regiment—probably—of the Spanish army during the expedition to Sicily in 1718. Appointed secretary to the duke of Liria, his knowledge of languages, his adaptability, his Irish wit and self-confidence made him a favourite not only with the duke of Liria, but with other Spanish authorities. He became known to Jose Patiño, minister to Philip V., and was sent by him on a mission to Spanish America. In 1747 he was employed in the peace negotiations at Aix-la-Chapelle, and in 1748 was named minister in London, where he was popular. A partisan of an English alliance, his views recommended him to the favour of Ferdinand VI. (1746–59), whose policy was resolutely peaceful. From 1752–64 he was minister of foreign affairs at Madrid. Charles III. (1759–88) continued Wall in office, but the king's close relations with the French branch of the House of Bourbon made Wall's position very trying: as a foreigner he was suspected of favour to the English. Charles, however, detested changing his ministers and Wall only extorted leave in 1764 by feigning a disease of the eyes. He was given a handsome allowance and a grant for life of the crown land near Granada, which afterwards became Godoy's and finally, the duke of Wellington's.

See Coxe, *Memoirs of the Kings of Spain of the House of Bourbon* (London, 1815); *Documentos inéditos para la historia de España*, vol. xciii. (Madrid, 1842 *et seq.*).

WALLABY or **BRUSH KANGAROO,** names applied to the members of a section of the genus *Macropus*, kangaroos with naked muffle frequenting forests and scrubs. (*See* KANGAROO.)

WALLACE, ALFRED RUSSEL (1823–1913), British naturalist, was born at Usk, Monmouthshire, on Jan. 8, 1823. After leaving school he worked as a land surveyor and architect. About 1840 he began to take an interest in botany, and began the formation of a herbarium. In 1844–1845, while an English master in the Collegiate School at Leicester, he met H. W. Bates, through whose influence he became a beetle collector, and with whom he started in 1848 on an expedition to the Amazon. In March 1850 the two naturalists separated, and each wrote an account of his travels and observations. Wallace's *Travels on the Amazon and Rio Negro* was published in 1853. On his voyage home from South America the ship was burnt and his collections lost, except those which he had despatched beforehand. In 1854–62 he made a tour in the Malay Archipelago. His deeply interesting narrative, *The Malay Archipelago*, appeared in 1869. The chief parts of his vast insect collections eventually passed into the Hope Collection of the university of Oxford and the British Museum. Wallace divided the Malay Archipelago into a western group of islands, which in their zoological affinities are Oriental, and an eastern, which are Australian. The Oriental Borneo and Bali are respectively divided from Celebes and Lombok by a narrow belt of sea known as "Wallace's Line," on the opposite sides of which the indigenous mammalia are as widely divergent as in any two parts of the world. Wallace originated the theory of natural selection during these travels.

Origin of Species.—In February 1855, staying at Sarawak, in Borneo, he wrote an essay "On the Law which has regulated the Introduction of New Species" (*Ann. and Mag. Nat. Hist.*, 1855, p. 184). He states the law as follows: "Every species has come into existence coincident both in time and space with a pre-existing closely-allied species." For three years, so he tells us, "the question of *how* changes of species could have been brought about was rarely out of my mind." Finally, in February 1858, during a severe attack of intermittent fever at Ternate, in the Moluccas, he began to think of Malthus's *Essay on Population*, and, to use his own words, "there suddenly flashed upon me the *idea* of the survival of the fittest." The theory was thought out during the rest of the ague fit, drafted the same evening, written out in full in the two succeeding evenings, and sent to Darwin by the next post. Darwin in England at once recognized his own theory in the manuscript essay sent by the young and almost unknown naturalist in the tropics, then a stranger to him. "I never saw a more striking coincidence," he wrote to Lyell on the very day, on June 18, when he received the paper: "if Wallace had my ms. sketch written out in 1842, he could not have made a better short abstract! Even his terms now stand as heads of my chapters."

Under the advice of Sir Charles Lyell and Sir Joseph Hooker, the essay was read, together with an abstract of Darwin's own views, as a joint paper at the Linnean Society on July 1, 1858. The title of Wallace's section was "On the Tendency of Varieties to depart indefinitely from the Original Type." The "struggle for existence," the rate of multiplication of animals, and the dependence of their average numbers upon food supply, are very clearly demonstrated, and the following conclusion was reached: "Those that prolong their existence can only be the most perfect in health and vigour; . . . the weakest and least perfectly organized must always succumb."

The difference between Lamarck's theory and natural selection is very clearly pointed out. "The powerful retractile talons of the falcon and the cat tribes have not been produced or increased by the volition of those animals; but among the different

varieties which occurred in the earlier and less highly organized forms of these groups, *those always survived longest which had the greatest facilities for seizing their prey.* Neither did the giraffe acquire its long neck by desiring to reach the foliage of more lofty shrubs, and constantly stretching its neck for the purpose, but because any varieties which occurred among its antitypes with a longer neck than usual *at once secured a fresh range of pasture over the same ground as their shorter-necked companions, and on the first scarcity of food were thereby enabled to outlive them.*" With such clear statements as these in the paper of July 1, 1858, it is remarkable that even well-known naturalists should have failed to comprehend the difference between Lamarck's and the Darwin-Wallace theory. Wallace also alluded to the resemblance of animals, and more especially of insects, to their surroundings, and points out that "those races having colours best adapted to concealment from their enemies would inevitably survive the longest."

Natural Selection.—In 1870 Wallace's two essays, written at Sarawak and Ternate, were published with others as a volume, *Contributions to the Theory of Natural Selection.* In the additional essays, the new theory is applied to the interpretation of certain classes of facts. In this and other works, Wallace differs from Darwin on certain points. Thus the two concluding essays contend that man has not, like the other animals, been produced by the unaided operation of natural selection, but that other forces have also been in operation. We here see the influence of his convictions on the subject of "spiritualism." He expressed his dissatisfaction with the hypothesis of "sexual selection" by which Darwin sought to explain the conspicuous characters which are displayed during the courtship of animals. The expression of his opinion on both these points of divergence from Darwin will be found in *Darwinism* (1889).

Darwin died before the controversy upon the possibility of the hereditary transmission of acquired characters arose over the writings of Weismann, but Wallace freely accepted the general results of the German zoologist's teaching, and in *Darwinism* has presented a complete theory of the causes of evolution unmixed with any trace of Lamarck's use or disuse of inheritance, or Buffon's hereditary effect of the direct influence of surroundings. *Tropical Nature and other Essays* appeared in 1878, since republished combined with the 1871 *Essays,* of which it formed the natural continuation. His *Geographical Distribution of Animals* (1876), is a monumental work, which justifies its author's hope that it may bear "a similar relation to the eleventh and twelfth chapters of the *Origin of Species* as Mr. Darwin's *Animals and Plants under Domestication* bears to the first." *Island Life,* a supplement to the last-named work, appeared in 1880.

Miscellaneous Works.—Wallace published *Miracles and Modern Spiritualism* in 1875 (new ed. 1896). Here is given an account of the reasons which induced him to accept beliefs which are shared by so small a proportion of scientific men. These reasons are purely experimental, and in no way connected with Christianity, for he had long before given up all belief in revealed religion. In 1882 he published *Land Nationalization,* in which he argued the necessity of state ownership of land, a principle which he had originated long before the appearance of Henry George's work. In *Forty-five Years of Registration Statistics* (1885) he maintained that vaccination is useless and dangerous. Wallace also published an account of what he held to be the greatest discoveries as well as the failures of the 19th century, *The Wonderful Century* (1898; new ed. 1903). His later works include *Studies, Scientific and Social* (1900), *Man's Place in the Universe* (1903) and his *Autobiography* (1905). Later works were *The World and Life* (1910) and *Social Environment and Moral Progress* (1912). Possessed of a bold and original mind, his activities radiated in many directions, apparently rather attracted than repelled by the unpopularity of a subject. A non-theological *Athanasius contra mundum,* he has the truest missionary spirit.

Wallace was married in 1866 to the eldest daughter of the botanist, William Mitten, of Hurstpierpoint, Sussex. In 1871 he built a house at Grays, Essex, in an old chalk-pit, and after living there five years, moved successively to Croydon (two years) and Dorking (three years). In 1881 he built a cottage at Godalming near the Charterhouse school, and grew nearly 1,000 species of plants in the garden which he made. In 1889 he moved to Dorsetshire. After his return to England in 1862 Wallace visited the continent, especially Switzerland, for rest and change (1866, 1896) and the study of botany and glacial phenomena (August 1895). In October 1887 he went for a lecturing tour in the United States. He delivered six Lowell lectures in Boston. He saw the Yosemite Valley, the Big Trees, and botanized in the Sierra Nevada and at Gray's Peak.

The first Darwin medal of the Royal Society was awarded to A. R. Wallace in 1890, and he had received the Royal medal in 1868. A pension was awarded him by Mr. Gladstone at the beginning of 1881. In 1910 he received the Order of Merit. Wallace died at Broadstone, Dorset, on Nov. 7, 1913.

See A. R. Wallace, *My Life* (new ed., 1908); J. Marchant, *A. R. Wallace: letters and reminiscenses* (2 vols., 1916); L. T. Hogben, *A. R. Wallace* (1918); B. Petronijevic, *C. Darwin and A. R. Wallace* (1925).

WALLACE, SIR DONALD MACKENZIE (1841–1919), British author and journalist, was born on Nov. 11, 1841. He was educated at the universities of Glasgow, Edinburgh, Berlin and Heidelberg and at the Ecole de Droit, Paris. When 28 years of age he was invited by a friend to visit Russia, and became so much interested that he remained there for six years. His *Russia* (1877) had a great success, and was at once recognized as a classic. Mackenzie Wallace acted as correspondent of *The Times* in St. Petersburg (Leningrad), Berlin and Constantinople, and after the battle of Tell-el-Kebir (1882) in Egypt. From 1884–89 he was in India as private secretary to the viceroy, Lord Dufferin, and to his successor, Lord Lansdowne. From 1891–99 he was director of the foreign department of *The Times.* In 1899 he undertook the editorship of the New Volumes (issued in 1902 as the 10th edition) of *The Encyclopædia Britannica,* but only remained on this work a few months. He had been created K.C.I.E. in 1887, and was made K.C.V.O. in 1901. In addition to his book on Russia he published *Egypt and the Egyptian Question* (1883) and *The Web of Empire* (1902). Wallace died at Lymington, Hants, on Jan. 10, 1919.

WALLACE, LEWIS (LEW) (1827–1905), American soldier and author, was born at Brookville (Ind.), April 10, 1827. He abandoned law in Indianapolis to recruit volunteers for the Mexican War, and served in 1846–47. In the Civil War he served in the West Virginia campaign. After the capture of Fort Donelson as major-general, he was engaged at Shiloh, and commanded the Eighth Corps at Baltimore. By delaying the Confederate general J. A. Early at Monocacy he saved Washington from almost certain capture. General Wallace served as president of the courts of inquiry which investigated the conduct of General D. C. Buell and condemned Henry Wirz, commander of the Confederate prison at Andersonville (Ga.). He was also a member of the court which tried the alleged conspirators against President Lincoln. He resigned from the Army in 1865 to return to the bar. He served as governor of New Mexico Territory (1878–81) and as minister to Turkey (1881–85), but declined the mission to Brazil under President Harrison. He died at Crawfordsville (Ind.), Feb. 15, 1905. His literary reputation rests upon three historical romances: *The Fair God* (1873), a story of the conquest of Mexico; *The Prince of India* (1893), dealing with the Wandering Jew and the Byzantine empire; and his greatest popular success, *Ben Hur* (1880), an absorbing tale of the coming of Christ, which was translated into several languages, and provided spectacular entertainment on the stage and in moving pictures, the chariot scene being famous. *Lew Wallace: An Autobiography* was published in 1906.

WALLACE, SIR RICHARD, BART. (1818–1890), English art collector and philanthropist, was born in London on July 26, 1818, and died in Paris on July 20, 1890. He was a natural son of the fourth Marquess of Hertford and Agnes Jackson and was educated, mainly at Paris under the auspices of his father's mother, Maria, wife of the third marquess. At Paris he was well known in society, and became an assiduous collector of all sorts of valuable *objets d'art.* From 1857 Wallace devoted himself to assisting his

father, in Paris, to acquire a magnificent collection of the finest examples of painting, armour, furniture and *bric-à-brac*. In 1870 the Marquess of Hertford died unmarried, bequeathing to Wallace Hertford house and its contents, the house in Paris, and large Irish estates. Some of the finest things in the collection were then transferred to Hertford house. In 1871 he was created a baronet for his services in relief and hospital equipment during the siege of Paris. From 1873 to 1885 he sat in parliament for Lisburn, but he lived mostly in Paris among his art treasures. In 1878 he was one of the British commissioners at the Paris Exhibition, and he was also a trustee of the National Gallery and a governor of the National Gallery of Ireland. He married in 1871 the daughter of a French officer, and Lady Wallace, who died in 1897, bequeathed his great art collection to the British nation. It is now housed in Hertford house, Manchester square, London, which was acquired and adapted by the government.

See biography in *Catalogue of the Wallace Collection.*

WALLACE, SIR WILLIAM (*c.* 1270–1305), the popular national hero of Scotland, is believed to have been the second son of Sir Malcolm Wallace of Elderslie and Auchinbothie, in Renfrewshire. The only authority for the events of his early life is the metrical history of Blind Harry, who lived about two centuries later than Wallace, during which a considerable body of legend had probably gathered round the name. At the same time he professes to follow as his "autour" an account that had been written in Latin by John Blair, the personal friend and chaplain of Wallace himself. Blair's account has perished.

In his boyhood, according to the usual accounts, he resided for some time at Dunipace, in Stirlingshire, with an uncle, who is styled "parson" of the place. His education was continued at Dundee, where he made the acquaintance of John Blair. On account of an incident that happened at Dundee—his slaughter of a young Englishman named Selby, for an insult offered to him—he is said to have been outlawed, and so driven into rebellion against the English. He gradually gathered round him a body of desperate men whom he led in various attacks upon the English. Several of the more patriotic nobles—including the steward of Scotland, Sir Andrew Moray, Sir John de Graham, Douglas the Hardy, Wishart, bishop of Glasgow, and others—joined him. An attack was made upon the English justiciar, Ormsby, who was holding his court at Scone. The justiciar himself escaped, but many of his followers were captured or slain. The burning of the Barns of Ayr, the quarters of English soldiers, in revenge for the treacherous slaughter of his uncle, Sir Ronald Crawford, and other Scottish noblemen, followed.

The success of these exploits induced the English king to send an army, under the command of Sir Henry Percy and Sir Robert Clifford, against the insurgents. The English came up with Wallace at Irvine, when all Wallace's titled friends left him and made submission to Edward, except the ever faithful Sir Andrew Moray. The treaty of Irvine by which these Scottish nobles made submission, is printed in Rymer's *Foedera*. It is dated July 9, 1297, and is the first public document in which the name of Sir William Wallace occurs. Wallace retired to the north, and although deserted by the barons was soon at the head of a large army. In a short time he recovered almost all the fortresses held by the English to the north of the Forth. He had begun the siege of Dundee when he heard that an English army, led by the earl of Surrey and Cressingham the treasurer, was on its march northward.

Battle of Stirling.—Leaving the citizens of Dundee to continue the siege of the castle, he made a rapid march to Stirling. Encamping in the neighbourhood of the Abbey Craig—on which now stands the national monument to his memory—he watched the passage of the Forth. After an unsuccessful attempt to bring Wallace to terms, the English commander, on the morning of Sept. 11, 1297, began to cross the bridge. When about one half of his army had crossed, and while they were still in disorder, they were attacked with such fury by Wallace, that almost all—Cressingham among the number—were slain, or driven into the river and drowned. Those on the south side of the river were seized with panic and fled tumultuously, having first set fire to the bridge. The Scots, however, crossed by a ford, and continued the pursuit as far as Berwick. Sir Andrew Moray was killed.

Its results were important. The English were everywhere driven from Scotland. To increase the alarm of the English, as well as to relieve the famine which then prevailed, Wallace organized a great raid into the north of England, in the course of which he devastated the country to the gates of Newcastle. On his return he was elected guardian of the kingdom. In this office he set himself to reorganize the army and to regulate the affairs of the country. His measures were marked by much wisdom and vigour, and for a short time succeeded in securing order, even in the face of the jealousy and opposition of the nobles.

Battle of Falkirk.—Edward was in Flanders when the news of this successful revolt reached him. He hastened home, and at the head of a great army entered Scotland in July 1298. Wallace slowly retired before the English monarch, driving off all supplies and wasting the country. The nobles as usual for the most part deserted his standard. Edward, compelled by famine, had already given orders for a retreat when he received information of Wallace's position and intentions. The army, then at Kirkliston, was immediately set in motion, and next morning (July 22, 1298) Wallace was brought to battle in the vicinity of Falkirk. After an obstinate fight the Scots were overpowered and defeated with great loss. Among the slain was Sir John de Graham, the bosom friend of Wallace, whose death, as Blind Harry tells, threw the hero into a frenzy of rage and grief. The account of his distress is one of the finest and most touching passages in the poem. With the remains of his army Wallace found refuge for the night in the Torwood—known to him from his boyish life at Dunipace. He then retreated to the north, burning the town and castle of Stirling on his way. He resigned the office of guardian, and betook himself again to predatory warfare against the English.

Betrayal.—At this point his history again becomes obscure. He is known to have paid a visit to France, with the purpose of obtaining aid for his country from the French king. This visit is narrated with many untrustworthy details by Blind Harry; but the fact is established by other and indisputable evidence. When in the winter of 1303–1304 Edward received the submission of the Scottish nobles, Wallace was expressly excepted from all terms. A price was set upon his head, and the English governors and captains in Scotland had orders to use every means for his capture. On Aug. 5, 1305 he was taken—as is generally alleged, through treachery—at Robroyston, near Glasgow, by Sir John Menteith, carried to the castle of Dumbarton, and thence conveyed in fetters and strongly guarded to London. He reached London on the 22nd of August, and next day was taken to Westminster Hall, where he was impeached as a traitor by Sir Peter Mallorie, the king's justice. To the accusation Wallace made the simple reply that he could not be a traitor to the king of England, for he never was his subject, and never swore fealty to him. He was found guilty and condemned to death. The sentence was executed the same day with circumstances of unusual cruelty.

For bibliography *see* the article in the *Dict. Nat. Biog.* The principal modern lives are James Moir's (1886), and A. F. Murison's (1898). (A. F. Hu.; X.)

WALLACE, WILLIAM VINCENT (1812–1865), Irish composer, was born at Waterford, Ireland, on Mar. 11, 1812. He led a roving and adventurous career in Australia, the South Seas, India, and S. America. In 1845 he settled in London and in November of that year his opera *Maritana* was played at Drury Lane theatre with great success. This was followed by *Matilda of Hungary* (1847), *Lurline* (1860), *The Amber Witch* (1861), *Love's Triumph* (1862), and *The Desert Flower* (1863). He also composed for the piano. He died on Oct. 12, 1865.

WALLACE, a city of Idaho, on the Coeur d'Alene river. Pop. (1928 estimate) 3,500. The city lies in a cup in the mountains, at an altitude of 2,733 ft., and is the trading centre for the Coeur d'Alene mining district, which produces 25% of the lead and 20% of the silver mined in the United States and had in 1927 a total output valued at $28,574,891. About 25 m. W. is the old Idaho Mission, built in 1853 without nails by three Jesuit priests, aided by the Coeur d'Alene Indians. Wallace was settled in 1884 and incorporated in 1892.

WALLACK, JAMES WILLIAM (1795–1864), Anglo-American actor and manager, born in London Aug. 24, 1795. His parents and their four children were all actors of merit. From 1807 to 1818 he appeared chiefly at the Drury Lane Theatre in London. Between 1818 and 1852 he frequently crossed and re-crossed the Atlantic, playing alternate engagements at London and New York. He settled in New York permanently in 1852 and opened the first Wallack's Theatre at the corner of Broadway and Broome streets. Here he remained with a notable company until 1861 and then removed to the second Wallack's Theatre which he himself built at 13th Street and Broadway. His was the best-known house in the city. Thackeray praises his Shylock, and Joseph Jefferson, his Don Caesar de Bazan. He married the daughter of John H. Johnstone, a comedian long popular in England. Their son, JOHN LESTER WALLACK, was born in New York City Jan. 1, 1820. After playing on the Dublin and London stage he made his first New York appearance in 1847 at the Broadway Theatre. He played here two years, then at the Bowery, Niblo's Garden, Brougham's Lyceum, and finally, beginning in 1852, in leading parts at his father's theatre. He succeeded to the management of Wallack's Theatre in 1861, continuing it in the traditions of his father. In 1882 he opened the third Wallack's Theatre at 30th street and Broadway. He afterwards conducted both theatres with marked success until his death, Sept. 6, 1888, at Stamford, Conn. He had one of the largest repertoires of any American actor, and showed particular aptitude for light comedy and romantic parts. He wrote his own *Memories of Fifty Years* (1889).

WALLAROO, a seaport of South Australia. Pop. 3,200. It was the port and smelting centre for the once famous copper-mining area of Moonta and Kadina which, though considerable ore-reserves are believed still to exist, has at present closed down.

WALLASEY, county borough, Cheshire, England. Pop. (1921) 90,809. It is served by the L.M.S. and G.W. railways, and three ferries connect it with Liverpool. The church of St. Hilary, a foundation of the 10th century, was rebuilt in 1759 and again in 1858 after a fire. The lowest part of the tower is probably 13th century work and bears a date 1536. In the west is Leasowe castle, supposed to have been built by the 5th earl of Derby. The Birkenhead docks (*q.v.*) were built on Wallasey Pool, when remains of a submerged forest with animal skeletons were found. New Brighton in the north is a watering place and residential area. A promenade traverses the river front and there are piers at New Brighton and Egremont. The municipal borough was incorporated in 1910, the county borough in 1913 and the parliamentary borough in 1918.

WALLA WALLA, a city in the southeastern part of Washington, U.S.A.. The population was 15,503 in 1920, of which 87% was native white. It was estimated locally at 20,000 in 1928. It is the metropolis of the fertile Walla Walla valley, stretching away to the Blue mountains on the east, which produces large crops of wheat, alfalfa, vegetables, apples, prunes, cherries, and melons and large quantities of live stock and poultry. It is the seat of Whitman college (chartered 1859) and Walla Walla college (Adventist; 1891). A mission of the American Board at Waiilatpu, 5 m. west, was attacked by Indians in 1847, who massacred the missionary, Whitman, his wife, and 12 others, carrying off the rest of the residents as prisoners. In 1857 Ft. Walla Walla was built by the U.S. Government on the site of the present city. About the fort in 1857–58 a settlement grew up. Walla Walla was laid out and organized as a town in 1859 and in 1862 it was chartered as a city. Walla Walla is served by the Northern Pacific and the Oregon Railroad & Navigation Co.'s (Union Pacific) lines. An airport was opened in 1928. The name is a Nez Percé Indian term, meaning "many waters."

WALL-CREEPER, a bird (*Tichodroma muraria*) allied to the tree-creeper (*q.v.*), but larger and more brilliantly coloured. It inhabits central Europe. The wall-creeper belongs to the passerine family *Certhiidae*.

WALLENBERG, MARCUS (1864–), Swedish financier, brother of Knut Agathon Wallenberg, financier and Swedish foreign minister (1914–18), began his career as a naval officer, and then studied and practised law. He afterwards became a member of the managerial board of the Stockholm Enskilda Bank, being appointed managing director in 1911 and vice-chairman in 1920. He founded, or reorganized, a number of industrial undertakings in Sweden, and also, in 1905, the Norsk Hydro-elektrisk Kvaelstof Aktieselskab in Norway, and was one of the founders of the Central Bank for Norway and of the Swedish Industrial Union. In 1916 and 1917, and in 1917–18, he took part in the negotiations with the Allied Powers concerning trading matters. He became a member of the neutral Powers' economic section of the Supreme Economic Council at Paris in 1919, took part in the Amsterdam meeting in 1919, and was Swedish representative at the Brussels Economic Conference in 1920. He was finance delegate at the Genoa Conference in 1922, a member of the Finance Committee of the League of Nations in 1924, and chairman of the committee for arranging the tax on German industry under the Dawes Plan.

WALLENSTEIN (properly WALDSTEIN), **ALBRECHT WENZEL EUSEBIUS VON,** duke of Friedland, Sagan and Mecklenburg (1583–1634), German soldier and statesman, was born of a noble but by no means wealthy or influential family at Herrmanitz, Bohemia, on Sept. 15, 1583. His parents were Lutherans, and in early youth he attended the school of the Brothers of the Common Life at Koschumberg. After the death of his parents he was sent by his uncle, Slawata, to the Jesuit college of nobles at Olmütz, after which he professed, but hardly accepted, the Roman Catholic faith. In 1599 he went to the university of Altdorf, which he had to leave in consequence of some boyish follies. Afterwards he studied at Bologna and Padua, and visited many places in southern and western Europe. While in Padua he gave much attention to astrology, and during the rest of his life he never wavered in the conviction that he might trust to the stars for indications as to his destiny. For some time Wallenstein served in the army of the emperor Rudolph II. in Hungary, which was commanded by a methodical professional soldier, Giorgio Basta. His personal gallantry at the siege of Gran won for him a company without purchase. In 1606 he returned to Bohemia, and soon afterwards married an elderly widow, Lucretia Nikossie von Landeck, whose great estates in Moravia he inherited after her death in 1614. His new wealth enabled him to offer two hundred horse, splendidly equipped, to the archduke Ferdinand for his war with Venice in 1617. Wallenstein commanded them in person, and from that time he enjoyed both favour at court and popularity in the army. He made a wealthy marriage with Isabella Katharina, daughter of Count Harrach.

In the disturbances which broke out in Bohemia in 1618 and proved to be the beginning of the Thirty Years' War, advances were made to Wallenstein by the revolutionary party; but he preferred to associate himself with the imperial cause, and he carried off the treasure-chest of the Moravian estates to Vienna, part of its contents being given him for the equipment of a regiment of cuirassiers. At the head of this regiment Wallenstein won great distinction under Buquoy in the war against Mansfeld. He was not present at the battle of the Weisser Berg, but he did brilliant service as second-in-command of the army which opposed Bethlen Gabor in Moravia, and recovered his estates which the nationalists had seized. The battle of the Weisser Berg placed Bohemia at the mercy of the emperor Ferdinand, and Wallenstein turned the prevailing confusion to his own advantage. He secured the great estates belonging to his mother's family, and the emperor sold to him on easy terms vast tracts of confiscated lands. His possessions he was allowed to form into a territory called Friedland, and he was raised in 1622 to the rank of an imperial count palatine, in 1623 to that of a prince. In 1625 he was made duke of Friedland. Meantime he fought with skill and success against Bethlen Gabor, and so enhanced his reputation at the dark moment when Vienna was in peril and the emperor's general Buquoy dead on the field of battle. He was not only the detached visionary with vast ambitions, but also the model ruler of his principality. He placed the administration of justice on a firm basis, founded schools, and developed agriculture and mining and manufactures.

When the war against the Bohemians had become a widespread

conflagration, Ferdinand found he had no forces to oppose to the Danes and the Northern Protestants other than the Army of the League, which was not his, but the powerful and independent Maximilian's, instrument. Wallenstein saw his opportunity and early in 1626 he offered to raise not a regiment or two, but a whole army for the imperial service. After some negotiations the offer was accepted, the understanding being that the troops were to be maintained at the cost of the countries they might occupy. Wallenstein's popularity soon brought great numbers of recruits to his standard. He soon found himself at the head of 30,000 (not long afterwards of 50,000) men. For the campaigns of this army in 1625, 1626 and 1627, against Mansfeld, the Northern Protestants and Bethlen Gabor *see* THIRTY YEARS' WAR.

Having established peace in Hungary, Wallenstein proceeded, in 1627, to clear Silesia of some remnants of Mansfeld's army; and at this time he bought from the emperor the duchy of Sagan, his outlay in the conduct of the war being taken into account in the conclusion of the bargain. He then joined Tilly in the struggle with Christian IV., and afterwards took possession of the duchy of Mecklenburg, which was granted to him in reward for his services, the hereditary dukes being displaced on the ground that they had helped the Danish king. He failed to capture Stralsund, which he besieged for several months in 1628. This important reverse caused him bitter disappointment, for he had hoped that by obtaining free access to the Baltic he might be able to make the emperor as supreme at sea as he seemed to be on land. It was a part of Wallenstein's scheme of German unity that he should obtain possession of the Hanseatic towns, and through them destroy or at least defy the naval power of the Scandinavian kingdom, the Netherlands and England. This plan was completely frustrated by the resistance of Stralsund, and even more by the emperor's "Edict of Restitution," which not only rallied against him all the Protestants but brought in a great soldier and a model army, Gustavus and the Swedes.

At the same time the victory of the principles of the League involved the fall of Wallenstein's influence. By his ambitions, his high dreams of unity and the incessant exactions of his army, he had made for himself a host of enemies. He was reported to have spoken of the arrogance of the princes, and it appeared probable that he would try to bring them, Catholics and Protestants alike, into rigid subjection to the crown. Again and again the emperor was advised to dismiss him. Ferdinand was very unwilling to part with one who had served him so well; but the demand was pressed so urgently in 1630 that he had no alternative, and in September Wallenstein was removed.

Wallenstein accepted the decision calmly, gave his army to Tilly, and retired to Gitschin, the capital of his duchy of Friedland. There, and at his palace in Prague, he lived in an atmosphere of mysterious magnificence, the rumours of which penetrated all Germany.

Gustavus Adolphus had landed in Germany, and it soon became obvious that he was formidable. Tilly was defeated at Breitenfeld and on the Lech, where he received a mortal wound, and Gustavus advanced to Munich, while Bohemia was occupied by his allies the Saxons. The emperor entreated Wallenstein to come once more to his aid. Wallenstein at first declined; he had, indeed, been secretly negotiating with Gustavus Adolphus, in the hope of destroying the League and its projects and of building his new Germany without French assistance. However, he accepted Ferdinand's offers, and in the spring of 1632 he raised a fresh army as strong as the first within a few weeks and took the field. This army was placed absolutely under his control, so that he assumed the position of an independent prince rather than of a subject. His first aim was to drive the Saxons from Bohemia—an object which he accomplished without serious difficulty. Then he advanced against Gustavus Adolphus, whom he opposed near Nuremberg and after the battle of the Alte Veste dislodged. In November came the great battle of Lützen (*q.v.*), in which the imperialists were defeated, but Gustavus Adolphus was killed.

To the dismay of Ferdinand, Wallenstein made no use of the opportunity provided for him by the death of the Swedish king, but withdrew to winter quarters in Bohemia. In the campaign of 1633 much astonishment was caused by his apparent unwillingness to attack the enemy. He was in fact preparing to desert the emperor. In the war against the Saxons he had offered them as terms of peace the revocation of the Edict. Religious toleration and the destruction of the separatist régime, as well as not inconsiderable aggrandisements for his own power, formed his programme, so far as historians have been able to reconstruct it, and becoming convinced from Ferdinand's obstinacy that the Edict would never be rescinded, he began to prepare to "force a just peace on the emperor in the interests of united Germany." With this object he entered into negotiations with Saxony, Brandenburg, Sweden and France. He had vast and vague schemes for the reorganization of the entire constitutional system of the empire, with himself as supreme authority.

Irritated by the distrust excited by his proposals, and anxious to make his power felt, he at last assumed the offensive against the Swedes and Saxons, winning his last victory at Steinau on the Oder in October. He then resumed the negotiations. In December he retired with his army to Bohemia, fixing his headquarters at Pilsen. It had soon been suspected in Vienna that Wallenstein was playing a double part, and the emperor, encouraged by the Spaniards at his court, anxiously sought for means of getting rid of him. Wallenstein was well aware of the designs formed against him, but displayed little energy in his attempts to thwart them. This was due in part, no doubt, to ill-health, in part to the assurances of his astrologer, Battista Seni.

His principal officers assembled around him at a banquet on Jan. 12, 1634, when he submitted to them a declaration to the effect that they would remain true to him. This declaration they signed. More than a month later a second paper was signed; but on this occasion the officers' expression of loyalty to their general was associated with an equally emphatic expression of loyalty to their emperor. On Jan. 24 the emperor had signed a secret patent removing him from his command, and imperial agents had been labouring to undermine Wallenstein's influence. On the 7th two of his officers, Piccolomini and Aldringer, had intended to seize him at Pilsen, but finding the troops there loyal to their general, they had kept quiet. But a patent charging Wallenstein and two of his officers with high treason, and naming the generals who were to assume the supreme command of the army, was signed on Feb. 18, and published in Prague.

Wallenstein realized the danger, and on Feb. 23, accompanied by his most intimate friends, and guarded by about 1,000 men, he went from Pilsen to Eger, hoping to meet the Swedes under Duke Bernhard. After the arrival of the party at Eger, Colonel Gordon, the commandant, and Colonels Butler and Leslie agreed to rid the emperor of his enemy. On the evening of Feb. 25, Wallenstein's supporters Illo, Kinsky, Terzky and Neumann were received at a banquet by the three colonels and then murdered. Butler, Captain Devereux and a number of soldiers hurried to the house where Wallenstein was staying, and broke into his room. He was instantly killed by a thrust of Devereux's partisan. Wallenstein was buried at Gitschin, but in 1732 the remains were removed to the castle chapel of Münchengrätz. The murderers were handsomely rewarded for their so-called act of justice.

WALLER, AUGUSTUS VOLNEY (1816–1870), English physiologist, was born at Faversham, Kent, on Dec. 21, 1816, and died at Geneva on Sept. 18, 1870. He studied in Paris and carried out researches at Bonn and Paris in neurology. The "Wallerian theory of degeneration" (*see* MEDICINE) was propounded by him in 1850 in a paper in *Philosophical Transactions*.

WALLER, EDMUND (1606–1687), English poet, was born on March 9, 1606, the eldest son of Robert Waller of Coleshill and Anne Hampden, his wife. Early in his childhood his father moved to Beaconsfield. Waller was educated at Eton and King's

College, Cambridge. He left without a degree, and it is believed that in 1621 he sat as a member for Agmondesham (Amersham) in the last parliament of James I. Clarendon says that Waller was "nursed in parliaments." In that of 1624 he represented Ilchester, and in the first of Charles I. Chipping Wycombe. The first act by which Waller distinguished himself, however, was his surreptitious marriage with a wealthy ward of the Court of Aldermen, in 1631. He was brought before the Star Chamber for this offence, and heavily fined. After bearing him a son and a daughter at Beaconsfield, Mrs. Waller died in 1634. It was about this time that the poet was elected into Falkland's "Club."

It is supposed that about 1635 he met Lady Dorothy Sidney, eldest daughter of the earl of Leicester, who was then eighteen years of age. He formed a romantic passion for this girl, whom he celebrated under the name of Sacharissa. She rejected him, and married Lord Spencer in 1639. In 1640 Waller was once more M.P. for Amersham; later, in the Long Parliament, he represented St. Ives. Waller had hitherto supported the party of Pym, but he now left him for the group of Falkland and Hyde. An extraordinary and obscure conspiracy against Parliament, in favour of the king, which is known as "Waller's Plot," occupied the spring of 1643, but on May 30 he and his friends were arrested. In the terror of discovery, Waller was accused of displaying a very mean poltroonery, and of confessing "whatever he had said, heard, thought or seen, and all that he knew . . . or suspected of others." Waller was called before the bar of the House in July, and made an abject speech of recantation. His life was spared and he was committed to the Tower, whence, on paying a fine of £10,000, he was released and banished the realm in Nov. 1643. He married a second wife, Mary Bracey of Thame, and went over to Calais, afterwards taking up his residence at Rouen.

In 1645 the *Poems* of Waller were first published in London, in three editions. Many of the lyrics were already set to music by Henry Lawes. In 1646 Waller travelled with Evelyn in Switzerland and Italy. During the worst period of the exile Waller managed to "keep a table" for the Royalists in Paris, although in order to do so he was obliged to sell his wife's jewels. At the close of 1651 the House of Commons revoked Waller's sentence of banishment, and he was allowed to return to Beaconsfield, where he lived very quietly until the Restoration.

In 1655 he published *A Panegyric to my Lord Protector,* and was made a Commissioner for Trade a month or two later. He followed this up, in 1660, by a poem *To the King, upon his Majesty's Happy Return.* Being challenged by Charles II. to explain why this latter piece was inferior to the eulogy of Cromwell, the poet smartly replied, "Sir, we poets never succeed so well in writing truth as in fiction." He entered the House of Commons again in 1661, as M.P. for Hastings, and Burnet has recorded that for the next quarter of a century "it was no House if Waller was not there." His sympathies were tolerant and kindly, and he constantly defended the Nonconformists. One famous speech of Waller's was: "Let us look to our Government, fleet and trade, 'tis the best advice the oldest Parliament man among you can give you, and so God bless you." After the death of his second wife, in 1677, Waller retired to his house called Hall Barn at Beaconsfield. In 1661 he had published his poem, *St. James' Park;* in 1664 he had collected his poetical works; in 1666 appeared his *Instructions to a Painter;* and in 1685 his *Divine Poems.* The final collection of his works is dated 1686, but there were posthumous additions made in 1690. He died at Hall Barn, with his children and his grandchildren about him, on Oct. 21, 1687.

Waller's lyrics were at one time admired to excess, but with the exception of "Go, lovely Rose" and one or two others, they have greatly lost their charm. His fancy was plain and trite. He made writing in the serried couplet the habit and the fashion. It was this regular heroic measure which was carried to so high a perfection by Dryden and Pope.

The only critical edition of Waller's *Poetical Works* is that edited, with a careful biography, by G. Thorn-Drury, in 1893. (E. G.; X.)

WALLER, SIR WILLIAM (*c.* 1597–1668), English soldier, son of Sir Thomas Waller, lieutenant of Dover, was educated at Magdalen Hall, Oxford, and served in the Venetian army and in the Thirty Years' War. He was knighted in 1622 after taking part in Vere's expedition to the Palatinate. In 1640, he became member of parliament for Andover and supported the parliament when the Civil War broke out in 1642. As colonel, he captured Portsmouth, Farnham Winchester and other places and in 1643 as major-general he operated around Gloucester and Bristol (*see* GREAT REBELLION), winning a victory at Highnam and capturing Hereford. He then opposed the advance of Sir Ralph Hopton and the Royalist western army, and though defeated at Lansdown (near Bath) he shut up the enemy in Devizes. However, Hopton and a relieving force from Oxford completely defeated Waller's army at Roundway Down, many reproaching Essex, the commander-in-chief, for allowing the Oxford royalists to turn against Waller. The Londoners, who had called him "William the Conqueror," raised a new army, but the forces were distinctively local, and resented long marches and hard work far from their own counties. At the first siege of Basing House, they mutinied in face of the enemy, and their gallantry at critical moments, such as the surprise of Alton in December 1643 and the recapture of Arundel in January 1644, but partially redeemed their general bad conduct. Waller himself, a general of the highest skill, "the best shifter and chooser of ground" on either side, was, like Turenne, at his best at the head of a small and highly-disciplined army.

Though successful in stopping Hopton's second advance at Cheriton (March 1644), he was defeated by Charles I. in the war of manoeuvre which ended with the action of Cropredy Bridge (June), and in the second battle of Newbury in October his tactical success at the village of Speen led to nothing. His last expeditions were made into the west for the relief of Taunton, and in these he had Cromwell as his lieutenant-general. By this time the confusion in all the armed forces of the parliament had reached such a height that reforms were at last taken in hand. The original suggestion of the celebrated "New Model" army came from Waller (July 2, 1644). Simultaneously came the Self-Denying Ordinance, which required all members of parliament to lay down their military commands. Waller had already requested to be relieved—and his active military career came to an end. Embittered and a Presbyterian, he was constantly engaged in opposing the Independents and the army politicians, and in supporting the Presbyterian-Royalist opposition to the Commonwealth.

He was several times imprisoned between 1648 and 1659. He promoted the final negotiations for the restoration of Charles II. and sat in the Convention Parliament. He died on the 19th of September 1668.

See Wood's *Athenae Oxonienses,* ed. Bliss, iii. 812, and two partial autobiographies, "Recollections by General Sir William Waller" (printed in *The Poetry of Anna Matilda,* 1788), and *Vindication of the Character,* etc. (1797).

WALLINGFORD, a town and borough of Berkshire, England, on the Thames, 55 m. W. of London by the G.W. railway. Pop. (1921) 2,726.

The site of Wallingford was occupied by a Romano-British settlement. Wallingford was a fortified town before the Conquest, and, though burned by Sweyn in 1006, was the most important borough in Berkshire at the time of the Domesday Survey. The town suffered greatly from the Black Death, and its decline was accelerated by the building, in the early 15th century, of two bridges near Abingdon, which diverted the main road between London and Gloucester from Wallingford. The earliest charters were given by Henry I. and Henry II., the latter confirming the ancient privileges of the borough. These charters were confirmed and enlarged by Henry III. in 1267 and by Philip and Mary in 1557–58. The governing charter until 1835 was that given by Charles II. in 1663. Wallingford Castle was one of the last fortresses to hold out for Charles I. During the Commonwealth it was demolished by order of the Government. The church of St. Leonard's retains some Norman work. The ancient castle has left only its mound and earthworks, and other works may be traced surrounding the town on the landward side.

WALLINGFORD, a borough of New Haven county, Connecticut, U.S.A., 12 m. N.N.E. of New Haven, on the Quinnipiac

river and the New York, New Haven and Hartford railroad. Pop. (1920) 9,648 (29% foreign-born white); 1928 local estimate 15,000. It is the seat of the Gaylord farm tuberculosis sanatorium, and of a Masonic home, built on property occupied (1851–80) by a branch of the Oneida community. The manufactures are important, and include silverware, brass goods, hardware, fire-arms, rubber goods, insulated wire and edge tools. The town of Wallingford was settled in 1670. In Jan. 1766, it adopted resolutions protesting against the Stamp Act, and imposed a penalty of 20s. on any one who should introduce or use stamped paper or parchment. Wallingford was incorporated in 1853.

WALLIS, JOHN (1616–1703), English mathematician, logician and grammarian, was born on Nov. 23, 1616, at Ashford, Kent, where his father was rector. He went up to Emanuel college, Cambridge, in 1632, became a fellow of Queen's, and took holy orders. He gained much credit with the parliamentarians by his talent in deciphering intercepted Royalist documents, and was presented in 1643 to the living of St. Gabriel, Fenchurch street, London, exchanged later for that of St. Martin, Ironmonger lane. Although he signed the Remonstrance against the execution of Charles I. he was appointed Savilian professor of geometry at Oxford in 1649, a chair which he held for over 50 years, until his death at Oxford on Oct. 28, 1703.

Works.—The works of Wallis relate to a multiplicity of subjects. His *Institutio logicae,* published in 1687, was very popular, and his *Grammatica linguae Anglicanae* indicates an acute and philosophic intellect. The mathematical works are published, some of them in a small 4to volume (Oxford, 1657) and a complete collection in three thick folio volumes (Oxford, 1693–99). The third volume includes, however, some theological and other material. The mathematical works contained in the first and second volumes occupy about 1,800 pages.

The *Arithmetica infinitorum* (1655) is the most important of his works. It relates chiefly to the quadrature of curves by the so-called method of indivisibles established by Bonaventura Cavalieri in 1629. (*See* INFINITESIMAL CALCULUS.) He extended the "law of continuity" as stated by Johannes Kepler; regarded the denominators of fractions as powers with negative exponents; and deduced from the quadrature of the parabola $y=x^m$, where m is a positive integer, the area of the curves when m is negative or fractional. As he was unacquainted with the binomial theorem, he attempted the quadrature of the circle by interpolation, and arrived at the remarkable expression known as *Wallis's Theorem.* (*See* article on CIRCLE.) In the same work Wallis obtained an expression for the length of the element of a curve, which reduced the problem of rectification to that of quadrature.

The *Mathesis universalis* (1658) a more elementary work, contains dissertations on algebra, arithmetic and geometry.

The *De algebra tractatus* (Eng. 1685) contains (chapters lxvi.–lxix.) the idea of the interpretation of imaginary quantities in geometry. This is given somewhat as follows: the distance represented by the square root of a negative quantity cannot be measured in the line backwards or forwards, but can be measured in the same plane above the line, or (as appears elsewhere) at right angles to the line either in the plane, or in the plane at right angles thereto. Considered as a history of algebra, this work is scrupulously fair to his predecessors in all cases where he was able to trace original discoveries.

The two treatises on the cycloid and on the cissoid, etc., and the *Mechanica* (three parts 1669–71) contain many results which were then new and valuable. The latter work contains elaborate investigations in regard to the centre of gravity, and in it Wallis employs the principle of virtual velocities.

For the prolonged conflict between Hobbes and Wallis, *see* HOBBES, THOMAS.

WALLIS ARCHIPELAGO (UVEA or UEA): *see* PACIFIC ISLANDS.

WALLON, HENRI ALEXANDRE (1812–1904), French historian and statesman, was born at Valenciennes on Dec. 23, 1812. Wallon succeeded Guizot as professor at the Sorbonne in 1846. Returning to politics in 1871 he immortalized himself by carrying his proposition for the establishment of the Republic with a president elected for seven years, and then eligible for re-election, which, after violent debates, was adopted by the Assembly on Jan. 30, 1875. "Ma proposition," he declared, "ne proclame pas la République, elle la fait." Upon the definitive establishment of the Republic, Wallon became Minister of Public Instruction, and effected many useful reforms, but his views were too conservative for the majority of the Assembly, and he retired in May 1876. He had been chosen a life senator in December 1875.

Returning to his historical studies, Wallon produced four works of great importance, though less from his part in them as author than from the documents which accompanied them: *La Terreur* (1873); *Histoire du tribunal révolutionnaire de Paris avec le journal de ses acts* (6 vols., 1880–82); *La Révolution du 31 mai et le fédéralisme en 1793* (2 vols., 1886); *Les Réprésentants du peuple en mission et la justice révolutionnaire dans les départements* (5 vols., 1880–1890). Besides these he published a number of articles in the *Journal des savants;* for many years he wrote the history of the Académie des Inscriptions (of which he became perpetual secretary in 1873) in the collection of *Memoirs* of this Academy. He died at Paris on Nov. 13, 1904.

WALLOON LITERATURE. Walloon is a Romance dialect, belonging to the same group as the Picard, Lorrain and Francian, of which the latter, under the name of French, has had such a notable development. The several varieties of Walloon are spoken in the southern part of Belgium, in that region generally called "Wallonie" (from a word coined about 1858), of which Liége is the chief centre of dialectal literature.

This literature has its historical monuments. To the northwest belong the cantilena of *Eulalie,* one of the oldest Romance texts (11th century), *Li Ver del Jüise* (the Last Trial), the *Dialogues du Pape Grégoire* (the Dialogues of Pope Gregory), commentaries on *Job, Lent Sermons* and the *Poème Moral,* a critical edition of which, prepared by Alph. Bayol, is to be published shortly. There are also the delightful song-fable of *Aucassin and Nicolette,* one of the masterpieces of the middle ages, and the copious, but somewhat fastidious chronicles of Jean le Bel, Jacques de Henricourt, Jean d'Outremeuse and Jean de Stavelot. Lastly, the edition by J. Cohen, in 1920, of the *Mystères et Moralités du Siècle,* has enriched the ancient literary patrimony of the Walloon country. The two Nativities to be found in Cohen's edition are undoubtedly the ancestors of *Noëls Wallons* (edit. by Doutrepont in 1909), which are still alive in the popular minds. It may be objected that those works were not written in the dialect spoken by the people at that time, but in a literary language of Picard rather than of French character. However, their dialectal features reveal the anonymous origin of the texts.

We must wait till the beginning of the 17th century before we can find works written in dialect. The three oldest texts written in the dialect of Liége are an *Ode,* dated 1620, a *Sonnet,* dated 1622, and a *Morality,* dated 1623. They were published in 1921 by Jean Haust. A pasquinade on *Women and Marriage* (edit. Jean Haust, 1925) is, unfortunately, undated, but might be assigned to about 1600. Of the 17th and 18th centuries we possess, in all, some 50 lyrical pieces; complaints of peasants about the devastations caused by foreign soldiers, speeches on the topics of the time, satires against the affectations of women, pamphlets about political troubles or religious controversies, humorous compliments on the occasion of a clerical promotion, etc. Their literary value is, on the whole, rather mediocre. An exception must be made, however, for the lyrical satire, *Les Eues di Tongue* (the Waters of Tongres, 1700), by Lambert Rickmann, perhaps the best Walloon satire in existence, of astonishing verve, rich in somewhat gross but striking images.

In the middle of the 18th century, four comic operas were composed. They constitute the so-called *Théâtre Liégeois* (edit. Bailleux, 1854). A literary circle used to meet at Chevalier S. de Harley's; its members (canons, deans, lords and rich bourgeois) amused themselves by writing burlesques, and a composer of great talent, Jean Noël Hamal, provided a lively and picturesque music to the libretti written by his friends. The performance achieved a tremendous success. The four plays in question are entitled *Li Voyedge di Tchaudfontaine* (the Journey

to Chaudfontaine), a delightful farce (edit. Haust, 1924); *Li Lidjives Egadgi* (the Enlisted Liégeois), a touching picture of local customs; *Li Fiesse di Houte-s'i-Plôût* (the Festival of H.), a village idyll with a somewhat weak plot; and above all, the most original piece of the collection, *Les Hypocondes* (the Hypochondriacs), a diverting picture of the whims and torments of imaginary invalids who go to Spa to drink the waters. A farce in two acts entitled *Li Mâlignant* (the Malevolent) closes this first series, which, although really remarkable for its local colour and veracity, is naturally deprived of high moral feeling.

The revolution of 1789 and the troubles it brought inspired numerous patriots of Liége with popular and satirical songs. Albin Body edited more than 250 of these, but they are now forgotten, with the exception of a song against *The Prussians*, written by the lawyer, J. J. Velez (1817), the popularity of which was revived by the World War.

Few names deserve notice in the first half of the 19th century. Among these may be mentioned *Li Côpareye* (1822) by Ch. N. Simonou, which celebrates the ancient clock-tower of the Cathedral of Saint-Lambert and the glorious deeds of the history of Liége; *Li Ktapé Manedge* (the Disordered Household) 1830, by H. J. Forir, a lively satire of the confusion produced in the commonwealth by carelessness and improvidence; *Li Pantalon Traive* (the Torn Trousers) 1839, by Ch. Du Vivier, an epos, in a few stanzas, of the fighter of 1830, the humble soldier who served under different régimes without any personal profit; *Li Bourgoyne* (1846) by Jos. Lamaze, a bacchic song which still enjoys popularity among the Walloon population.

A touching elegy *Leyiz-m'plorer* (Let Me Cry), 1854, and a graceful idyll *L'avez-v'-veyòu passer?* (Did you see her pass?) 1856, revealed in Nicolas Defrécheux a true poet. The Walloon people were delighted to hear their patois express such sincerity so delicately. In 1856 the *Société Liégeoise de Littérature Wallonne* was founded. It grouped intellectuals, scholars, writers and folklorists into a kind of small provincial academy, held yearly competitions and published "Bulletins" and "Annuaires."

In 1857 it awarded a prize to *Li Galant del Servante,* a play written by André Delchef, which opens the revival of the Walloon stage. In 1884, the Société awarded a prize to *Tati li Periguî,* by Edouard Remouchamps, a play which, because of its caustic vein and the admirable manner in which it was acted, led to a prodigious development of Walloon literature.

But everywhere the spoken dialect is losing ground to French; the dialect is considered as vulgar, especially in the Hainaut district, along the French frontier. However, the written dialect is used more than ever before. In nearly all villages, dramatic societies perform Walloon plays. In more important centres, writers are grouped in societies which award prizes and publish papers and periodicals: at Tournai, the *Théâtre* of Arthur Hespel, and the *Cabaret Wallon;* at Mons, the *Ropïeur* and its circle; at La 'Louvière, the *Mouchon d'Aunias;* at Charleroi, the *Association Littéraire;* at Namur, the society *Les Rèlis* and its organ *Le Juetteur Wallon;* in Liége, the *Société de Littérature Wallonne,* the *Caveau Liégeois,* the *Auteurs Wallons,* the *Wallonne* and many others; and so at Verviers, at Malmedy, etc. Liége has two theatres which, every night, perform Walloon plays before a fairly large audience; humour and wit is their chief feature, except when such writers as Henri Huard or Louis Laken, helped by excellent native actors, offer important plays. Poetry includes joyful songs, satirical pasquinades, sentimental ballads, and descriptive or narrative poems. Such works as *Li Pandi Bon Diu* (the Bread of God) by Henri Simon, the somewhat nostalgic poems of Joseph Vriendts, the love elegies of Emile Wiket, the lyrics of Martin Lejeune, Louis Lagauche, Marcel Launay, Jean Wisimus and many others, combine a real respect for style and prosody with true poetic feeling. Fiction has produced interesting works, such as the *Houlot* (1888) by D. D. Salme, *La Famille Tassin* (1900) by Ad. Tilkin, and the delicate *Solia d'Amour* (1928) by Joseph Laubain. Let us also mention *Cadet* by Jean Lejeune, who, with wonderful realism, relates incidents in the life of a rabbit, *Li Brak'ni* (the Poacher) by Joseph Calozet, a masterpiece that reminds the reader of the rustic stories of George Sand, and the tales *Pou Dire à l'Eschrienne* (Hearth Tales), to mention only a few. Walloon literature to-day is most vivid, and it is to be hoped that, like Gaelic literature, it will remain popular in its inspiration.

WALL PAPER: *see* INTERIOR DECORATION: *Wall Paper.*

WALL PAPER MANUFACTURERS LTD. This British joint stock company was formed in 1899 to combine the undertakings of many of the large wall paper manufacturers of Great Britain. Later, in 1915, other manufacturers joined the company, and it became the largest firm of its kind in the world.

The company manufactures not only what are commonly called wall papers, but ceiling papers, embossed papers, borders and friezes, leather papers, leatherettes, lincrusta, polychromes, ingrains and silk fibres. According to the returns the United Kingdom in 1927 exported printed and embossed paper hangings to the extent of 126,148cwt., value for export f.o.b. at £561,186. In 1928 the company had a share capital of £5,000,000, made up of £1,200,000 5% cumulative preference shares of £1, £1,400,000 in ordinary shares of £1 each and £2,400,000 in deferred shares of £1 each. (L. C. M.)

WALLQVIST, OLAF (1755–1800), Swedish statesman and ecclesiastic, was ordained in 1776, became doctor of philosophy in 1779, court preacher to Queen Louisa Ulrica in 1780, and bishop of Vexiö in 1787. He attracted the attention of Gustavus III. by his eloquent preaching at the fashionable St. Clara church at Stockholm and he was a bishop at thirty-two.

Gustavus placed him at the head of the newly appointed commission for reforming the ecclesiastical administration of the country. His political career began during the mutinous *riksdag* of 1786, when he came forward as one of the royalist leaders. At the stormy *riksdag* of 1789 it was very largely due to his co-operation that the king was able to carry through the famous "Act of Unity and Security" which converted Sweden from a constitutional into a semi-absolute monarchy. During the brief *riksdag* of 1792, as a member of the secret committee, Wallqvist was at the very centre of affairs and rendered the king essential services. Indeed it may be safely said that Gustavus III., during the last six years of his reign, mainly depended upon Wallqvist and his clerical colleague, Carl Gustaf Nordin (*q.v.*), who subordinated their private enmity to the royal service. During the Reuterholm (*q.v.*) administration, Wallqvist, like the rest of the Gustavians, was kept remote from court. In 1800 he was recalled to the political arena, but died on April 30.

As bishop of Vexiö, Wallqvist was remarkable for his extraordinary administrative ability. He did much for education and for the poorer clergy, and endowed the library of the gymnasium with 6,000 volumes. As an author also he was more than distinguished. His *Ecclesiastica Samlingar* testify to his skill and diligence as a collector of mss., while his *Minnen och Bref,* ed. E. V. Montan (Stockholm, 1878), is one of the most trustworthy authorities on the Gustavian era.

See R. N. Bain, *Gustavus III. and his Contemporaries* (London, 1895, vol. ii.); *O. Wallqvists Själfiografiska anteckningar* (Upsala, 1850); and J. Rosengren, *Om O. Wallqvist såsom Biskop och Eforus* (Vexiö, 1901). (R. N. B.)

WALL RIB, in architecture, the rib of a groined vault connecting two adjacent piers on the same side of the vaulted area. Wall ribs seem to have belonged to the vaulting system from the very beginning, for they exist in what is probably the earliest ribbed vaulted nave, that of S. Ambrogio at Milan (generally attributed to the second half of the 11th century).

WALLSEND, municipal borough, Northumberland. Pop. (1921) 42,995. The church of St. Peter dates from 1809. There are remains of the church of the Holy Cross in transitional Norman style. At an early period Wallsend was famous for its coal,

but the name is now used for coal that does not go through a sieve with meshes five-eighths of an inch in size. In addition to coal mines there are ship-building yards, engineering works, lead and copper smelting works, cement works and brick and tile works. There are two pontoon docks and an immense dry dock. Wallsend was incorporated in 1901, and in 1918 became a parliamentary borough. Wallsend is at the east end of Hadrian's Wall.

WALL STREET, a street in the lower part of New York City on which or near which are concentrated the chief financial institutions of the United States. It corresponds to the London financial district in Threadneedle, Throgmorton and Lombard streets, and is rivalled only by that centre in its importance as an international money market. The street itself is narrow and short, extending only some seven blocks from Broadway to East river, and the financial houses occupy only the upper or western half of the street. The Wall Street financial district, however, extends several blocks north and south of the street and also includes an area west of Broadway. This district in 1920 contained no less than 90 banks of which 21 were on Wall Street, 25 trust companies, 50 life and 250 marine and fire insurance companies, the general offices of over 100 railway corporations, 150 steamship firms, 150 iron, steel, copper and coal companies, and several hundred other large industrial corporations. Companies with securities listed on the Stock Exchange maintain at least a transfer office conveniently near. Besides the Stock Exchange there are in the neighborhood the Cotton Exchange, Coffee Exchange, Metal Exchange, Produce Exchange, the Curb Exchange and lesser exchanges. The district is the headquarters of most brokerage firms. Private bankers are also established in the street, the famous house of J. P. Morgan and Co., occupying its own building at the corner of Wall and Broad streets.

Wall Street owes its name to Peter Stuyvesant, who, in 1652, as governor of the little Dutch settlement of New Amsterdam, ordered a palisade built on the site to protect the town from feared invasions of the English. The last of the wall was removed in 1699 and both sides of the street were quickly built up. The street was famous in the political life of the country after the Revolution when for a brief period the governmental offices of the city, state and nation were all located there. At the old Federal Building, on the site of the present sub-treasury building George Washington in 1789 was first inaugurated president and there the first United States Congress met.

See F. T. Hill, *The Story of a Street* (1908) for history, and S. S. Pratt, *The Works of Wall Street* (3rd ed., 1921) for an analysis of the financial activities.

WALMER, a watering-place of Kent, England. Pop. of urban district (1921), 5,350. Lower Walmer, the portion most frequented by visitors, extends northward along the coast so as to be contiguous with Deal. Upper Walmer is a short distance inland, and below it Walmer castle lies close to the sea. This was a blockhouse built for coast defence by Henry VIII., but became the official residence of the Lords Warden of the Cinque Ports. It ceased to be the official residence in 1905, when the prince of Wales (afterwards George V.) was appointed Lord Warden, and the public was given access to those rooms which possess historical associations with former holders of the office, such as the duke of Wellington, who died here in 1852, William Pitt and others. Kingsdown, 1 m. south, is a decayed member of the Cinque Port of Dover.

WALMISLEY, THOMAS ATTWOOD (1814–1856), English musician, was born in London on Jan. 21, 1814. He was the eldest son of Thomas Forbes Walmisley (1783–1866), a well-known organist and composer of church music and glees. Thomas Attwood (*q.v.*), his godfather, taught him composition. He became organist at Trinity and St. John's colleges, Cambridge, in 1833, and in 1836 was made professor of music. He died at Hastings on Jan. 17, 1856. His *Cathedral Music* was edited after his death by his father, and published in 1857. Some fine examples of his work are to be found in the "Service in B flat," the Dublin Prize anthem and the madrigal "Sweete flowers."

See the article by A. D. Coleridge in Grove's *Dictionary of Music and Musicians.*

WALNUT, the name of several species of deciduous trees. The order Juglandaceae includes the three genera *Carya, Pterocarya* and *Juglans,* the latter comprising the walnuts, of which about twelve or thirteen species are generally recognized; some eight or nine are in cultivation. L. A. Dode, who has given special study to the genus, subdivides it into three main divisions, *Dioscaryon* (including the Persian or English walnut, *Juglans regia,* and six allied species, all of the Old World), *Cardiocaryon* (*J. mandshurica, J. cordiformis* and ten others indigenous to Manchuria, China and Japan) and *Rhysocaryon* (*J. nigra* and its allies, twenty-six in all, from the New World). He classifies *J. cinerea,* the grey walnut or butternut of Canada and the north-eastern States separately.

The walnuts are deciduous trees, mostly of forest size (the black walnut of North America, *J. nigra,* may attain a height of up to 150 feet and a girth of 20 ft.) although some few form shrubby trees only, with large, occasionally very large, alternate, compound, imparipinnate leaves; leaflets opposite, entire or serrate, two to seventeen pairs. The leaves and fruit in the husk have a very pleasant aromatic scent in the Persian walnut and some other species. The flowers are unisexual and borne on the same tree; the numerous staminate flowers are carried on cylindrical catkins 2 to 5 inches long, pendulous when fully developed, forming singly or in pairs above the leaf scars of the preceding year's shoots: the pollen is wind-carried in fertilization; the pistillate flowers, usually few in number and with greenish (in *regia*) fringed feathery re-curved stigmas, are borne on a short inflexible stalk terminating the young shoots of the new growth. Fruit a hard-shelled nut, usually oval or globular, enclosed by a smooth green pericarp which splits irregularly on maturity.

In the Persian walnut the nut is divided interiorly by two thin dissepiments into four incomplete cells, one separating the two cotyledons and the other dividing them into two lobes. The large, fleshy, curiously folded and crumpled cotyledons fill practically the whole cavity of the seed and do not emerge from the nut in germination. The hard, woody, corrugated endocarp is divided into two (very rarely three or four) not easily separable valves. Lubbock describes in detail the complicated structure of the fruit.

Timber.—The black walnut of North America and the Persian walnut of the old world furnish two much esteemed timbers for the cabinet-maker. The dark purplish brown of the former and the lighter greyish-brown and equally attractive tint of the latter, veined as it is so frequently with very dark brown or black, together with their excellent working and lasting properties make them first class furniture woods. The beautifully mottled and figured wood obtained from near the roots and from crotches of both species has a high value for veneer. Walnut burrs which occur occasionally, although rarely in England, on the trunk of the Persian walnut in its native countries, as large at times as six feet or more across, afford one of the most valuable woods in the world on account of the extraordinary beauty of the wavy, rippled and variegated figure. Owing to its non-warping property walnut is largely used for gunstocks, for which it has no equal. In the Persian walnut the annual rings are marked by sharp lines without pores; pores moderate-sized, not numerous, sometimes oval and sub-divided, often in oblique lines, somewhat more numerous and larger in the spring wood, conspicuous on a longitudinal section. Medullary rays very fine to fine and even moderately broad, variable in arrangement, silver grain inconspicuous, numerous regular, very fine, wavy, concentric bars joining the medullary rays (Gamble). The seasoned wood weighs about 45 lb. to the cubic foot, is moderately hard, compact, even-grained, easy to work and split, it shrinks very little in seasoning and does not crack nor warp. It should be allowed a long time in which to season thoroughly. Timber from walnut grown in Great Britain is said to be harder and more durable than the foreign. The walnut is a long-lived tree with a life of up to 200–300 or more years but in this country it is at its best for timber at about 100 years and is apt to become hollow with age. The value of walnut in 1925 on the farms in the centre of one of the principal French walnut districts was from 3/– to 4/– per cubic foot. Growing walnut timber from first generation hybrid

trees between the eastern American black walnut (*J. nigra*) and the Californian black walnut (*J. californica var. hindsii*) or between either of these blacks and the English walnut (*J. regia*), which show exceptional growth vigour much in excess of that of either parent, has been suggested by A. Henry (*Journal, Dept. of Ag. & Tech. Instr. for Ireland,* vol. XV., Oct. 1914) who cites de Vries' records of these hybrids obtained by Burbank showing a height of 80 ft. and girth of 6 ft. at 15 years and giving, in California, annual rings one inch in width. Contrary to popular belief rapidity of growth does not always connote soft and comparatively worthless wood. The sylviculture of walnut has been studied by Rebmann and others.

Persian Walnut.—The walnut is known to have been grown in England since 1562 but, from remains of the nut unearthed in Roman villas, was probably introduced during the period of Roman occupation. It is the *Jovis glans, Juglans,* of the Roman writers and both its nut and timber were highly valued in Roman times. It is native in Yugoslavia, Greece and the countries on the Black sea littoral and extends eastwards through the Caucasus, Persia, Afghanistan, the Himalayas and Bhutan to China, growing 100 ft. or more in height at its best and with a girth of 10, 15 and 20 ft.—even 28 ft. has been recorded (Brandis). It is fully at home in Great Britain and the characteristic grey corky bark of the mature bole, deeply marked with vertical more or less parallel fissures, is familiar. While preferring a deep well drained loamy and calcareous soil it grows well in a variety of soils provided they are not wet.

The walnut suffers comparatively little from serious pest or disease. Walnut blight, however (*Pseudomonas juglandis,* Pierce) in California and the allied Anthracnose (*Marsonia juglandis*) of the European trees causes considerable damage at times: the young succulent growth is attacked during the earlier months of the year, showing black sunken spots or canker, but the disease is usually checked as it becomes more woody in character and the parts affected therefore tend to heal. Little or no success has attended attempted control measures and most promise lies in finding resistant or immune varieties. The effect of attack by aphis (*Chromaphis juglandicola*) and the larva of the codlin moth (*Cydia pomonella*) may be serious at times. The so-called oak root fungus also takes its toll of trees in Europe and America.

Propagation.—After drying lightly the seed may be sown when ripe, or stratified in sand until about February and then planted at about its own depth on its side. If put out in the nursery it may be spaced nine or ten inches apart in rows, preferably in a light early soil to induce early maturity of the shoots as a protection against frost, to which, during its first years, the young tree is susceptible; once well away frost is not a serious danger. The primary root makes its exit from the apex and forms a long stout woody tapering taproot with a few lateral fibres during the first year. Transplanting even at one or two years accordingly requires special care and, where possible, the tree should be grown from the nut (which may previously be sprouted slightly with advantage) in its permanent site. Normally the young tree develops a well-balanced form and requires little pruning other than to re-form a leader if cut back by frost or to form the head at the desired height; pruning is best done about July when sealing of the wound is most rapidly effected.

In common with most fruit trees the walnut cannot be relied upon to yield varieties true to type from seed and, although the main proportion of the world's walnut crop is still the product of the seedling, modern walnut culture is wholly centred on grafted or budded trees. While the seedling tree may come into bearing at from 10 to 15 years old (the variety *praeparturiens* or *fertilis,* exceptionally, fruits in a few years) the grafted tree may be counted upon to do so from a comparatively early age. In France, where the walnut has long been one of the important commercial farm crops, grafting has been practiced for many years and some of the varieties such as Mayette and Franquette have been grafted on seedling *regia* stocks for over 100 years.

As pointed out by Loudon the walnut does not graft or bud easily by any method in northern France and in cold countries generally: in warmer climates like the south of France, Italy or California, it is readily propagated by vegetative methods. Knight also refers to this point in the early *Transactions of the Horticultural Society of London* (Vol. iii. & Vol. 1. 2nd ser.) and gives methods of overcoming the difficulty. The East Malling Research Station, Kent, has published methods suitable for employment in this country in its *Annual Report* for the years 1926–27, Supplement Part ii.

The Nut.—The culture of the walnut for the nut is immemorial. In countries where vegetative methods of propagation are unknown or not practiced upon this species long continued selection has tended to the evolution of varieties with some degree of fixity of type. This has occurred in parts of China and the Atlas mountains and has doubtless operated also largely in Europe. It has always been regarded as a very valuable tree and Evelyn in his *Sylva* (1664), records that in the neighbourhood of Hanau and Frankfort "no young farmer whatsoever is permitted to marry till he bring proof that he hath planted, and is a father of such a stated number of walnut trees." In Burgundy, they were valued "as great preservers by keeping the grounds warm; nor do the roots hinder the plough." In Czechoslovakia the walnut trees grown on the public highways, and owned by the villages produce most of the total crop; all are seedlihgs. Although walnut trees in orchard form are found in central and southern Europe (for example in the Grenoble district in France) the trees are usually scattered among cultivated crops.

The nut is extensively grown in China which exports to the United States, as also does Chile where the fruit ripens in March and April. Southern Europe furnishes large supplies for overseas trade, notably Rumania, Italy, France and Spain. The estimated crop in France in 1927, a very good crop year both in Europe and America, was about 55,000 tons, in Italy 10,000 and in Rumania 12,000. A normal Chinese crop gives, available for export, a tonnage of about 14,000. Other areas include the Near East, Persia, and northern India.

The most important expansion in the walnut industry in recent years is centred in California. Here again the seedling walnut, probably first introduced by the Franciscan Missions about the middle of the 18th century, held sway until well into the present century but latterly California has done much to further more scientific culture. The selected walnuts are grown in grove or orchard form with clean cultivation, except for inter-cropping in early years and green-soiling. The trees are generally spaced 50 or 60 feet apart, giving a yield of one to two thousand lb. of cured nuts per acre. In 1927 the crop amounted to about 36,000 tons. Some 100,000 acres of walnuts were in cultivation in 1924 to which fully 30,000 acres have been added.

Walnuts should be gathered as soon after falling as practicable as prolonged contact with the husk, which usually breaks away readily, causes deterioration in colour and favours the development of mould. In cases where it is necessary to remove the walnuts before they fall (rooks are fond of the nut and constitute a menace to its culture in Great Britain) a rubber covered hook on a long pole may assist in shaking down the nuts, after which they should be heaped but not allowed to remain longer than is absolutely necessary for the removal of the husk. To give the most attractive colour the nuts are frequently bleached, either by sulphur fumes or, with greater safety and advantage, by dilute hypochlorite solution, and are dried either by exposure to the sun in trays (in France usually in well-ventilated lofts) or artificially with warm air, a method now largely used in California. Thereafter the nuts, which have been dried from a moisture content of 25–40% down to about 8%, are mechanically graded for size. Commercial varieties of importance include Mayette, Franquette, Parisienne, Meylanaise, Corne, Chaberte and Marbot in France; Sorrento in Italy; Mayette, Franquette, Ehrhardt, Placentia, Concord, Chase, Eureka, Payne and Grove in California.

In Great Britain the seedling tree is still wholly dominant. Under the aegis of the Horticultural Division of the Ministry of Agriculture and with the help of the East Malling Research Station, work is in progress with the object of improving English walnut culture. The great majority of home-grown walnuts fail

to complete fully the normal processes of ripening and contain an undue proportion of carbohydrates and moisture and in consequence they are palatable only in a fresh undried condition. Search is being made for trees yielding nuts of good quality and especially those which are capable, under English climatic conditions, of developing a full normal oil content, on which keeping and other desirable qualities are largely dependent.

A good walnut after drying should contain 45–50% of kernel on the total weight and the kernel should contain 50–60% of oil. The best Californian varieties weigh from 11 to 14 grams (about 33 to 40 to the lb.), they average about 1·6 inches in length by 1·33 inches diameter at right angles to the sutural ridge and 1·25 inches across the latter and are a little larger than the corresponding grade of French nuts.

The kernel has about 18% protein and 16% carbohydrates in addition to the oil content and has a high food value. A good quality nut should show a combination of the following qualities: —uniform fairly large size and light colour, regular contour, moderately stout shell and good sealing; the nuts after drying by free exposure to living room temperature for 12 or 14 days should be well filled, plump, non-astringent and have the typical rich flavour, free from all woodiness, of the best French or Californian walnuts. The parent tree should give a reasonably reliable and good crop. Many English trees satisfy this latter requirement: crops of 1 to 4 cwt. are not uncommon from well-grown trees and 54 bushels have been harvested from a single tree, but are not of quality to warrant propagation.

Pickling.—It is essential to gather the nuts at a time, about the end of June or early July, when they may readily be pierced by a needle: the nuts have ceased to be in a proper condition for pickling when the shell can be felt. In France green walnuts, at the same stage of development, are converted into a form of conserve.

Oil.—Formerly much oil of a very good quality for edible and other purposes (for example, for paints) was expressed by growers from the dried walnut kernels, especially in France. The kernels are crushed to a paste in a simple form of stone mill, warmed and the oil expressed through sacks in a press, yielding half their weight, or a little more, of oil. Cold expressed oil gives a higher quality. In spite of the fact that a large trade has developed in recent years in walnut kernels, with the effect of diminishing the production of walnut oil, the value of the annual production of oil in France in 1914 was estimated to be about 6 million francs. In the areas of production it is held in higher esteem than olive oil. The husk of the walnut, after turning black, yields a dark brown very persistent dye on prolonged boiling in water.

(H. Sp.)

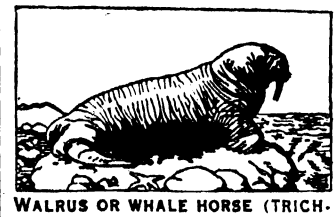
WALPOLE, HORATIO or Horace (1717–1797), English politician and man of letters, 4th earl of Orford—a title to which he only succeeded at the end of his life—was born in London, on Sept. 24, 1717. He was the youngest of the five children of the 1st earl of Orford (Sir Robert Walpole) by Catherine Shorter, but by some scandal-mongers, Carr, Lord Hervey, has been called his father. No such suspicion ever entered into the mind of Horace Walpole, who remained deeply attached to the memory of his parents throughout his life. He was educated at Eton, where he formed what was known as the "Quadruple Alliance" with Thomas Gray, Richard West and Thomas Ashton, and became very intimate with Henry Seymour Conway, George Augustus Selwyn and the two Montagus, and at King's College, Cambridge. Two years (1739–1741) were spent in Gray's company in the recognized grand tour of France and Italy. They stopped a few weeks in Paris, and three months at Reims. At Florence Walpole stayed for a year with Horace Mann, British envoy to the court of Tuscany. He continued to correspond with Mann till 1786, and as they never met again, their friendship, unlike most of Walpole's attachments, remained unbroken. After a short visit to Rome (March–June 1740), and after a further sojourn at Florence, Walpole and Gray quarrelled, and parted at Reggio.

Walpole came back to England on Sept. 12, 1741. He had been returned to parliament in May 1741 for the Cornish borough of Callington. He represented three constituencies in succession, Callington 1741–1754, the family borough of Castle Rising from 1754 to 1757, and King's Lynn, for which his father had long sat, from 1757 until 1768. In that year he retired, probably because his success in political life had not equalled his expectations, but he continued until the end of his days to follow and to chronicle the acts and the speeches of both houses of parliament. Through his father's influence he had obtained three lucrative sinecures in the exchequer, and for many years (1745–1784) he enjoyed a share, estimated at about £1,500 a year, of a second family perquisite, the collectorship of customs. He acquired in 1747 the lease and in the next year purchased the reversion of the villa of Strawberry Hill, near Twickenham, on the banks of the Thames. Six years later he began a series of alterations in the Gothic style, not completed for nearly a quarter of a century later, under which the original cottage became transformed into a building without parallel in Europe. On the 25th of June 1757 he established a printing-press there, which he called "Officina Arbuteana," where many of the first editions of his own works were printed. Other works printed here were Richard Bentley's designs for Gray's poems (1753), and reprints of the *Life of Lord Herbert of Cherbury, Memoirs of Grammont*, Hentzner's *Journey into England*, and Lord Whitworth's *Account of Russia*. The rooms were crowded with curiosities of every description, and the house and its contents were shown, by tickets to the public. Walpole paid several visits to Paris, where he made the acquaintance of Madame du Deffand (*q.v.*) in 1765, and they corresponded until her death in 1780. His nephew, the reckless 3rd earl, died on Dec. 5, 1791, and Horace succeeded to the peerage, but he never took his place in the House of Lords. All his life long he was a victim of the gout, but he lived to extreme old age, and died unmarried, in Berkeley Square, London, on March 2, 1797. All Walpole's printed books and manuscripts were left to Robert Berry and his two daughters, Mary and Agnes, and Mary Berry edited the five volumes of Walpole's works which were published in 1798. Their friendship had been very dear to the declining days of Walpole, who, it has even been said, wished to marry Mary Berry. The collections of Strawberry Hill, which he had spent nearly fifty years in amassing, were sold in 1842. They are described in a catalogue and in the *Gentleman's Magazine*.

The pen was ever in Horace Walpole's hands, and his entire compositions would fill many volumes. His *Castle of Otranto* (1764) is the prototype of the romantic novel. The *Mysterious Mother* (1768) is the least bad of tragedies when tragedy was at its worst.

The antiquarian works merit praise. The volume of *Historic Doubts on the Life and Reign of King Richard the Third* (1760), one of the earliest attempts to rehabilitate a character previously stamped with infamy, showed acuteness and research. A work of more lasting reputation, which has retained its vitality for more than a century, is entitled *Anecdotes of Painting in England*, (4 vols., 1762–1771). It was re-edited with additions by the Rev. James Dallaway in five volumes (1826–1828), and then again was revised and edited by R. N. Wornum in 1849. A cognate volume, also based on the materials of Vertue, is entitled the

Catalogue of Engravers Born and Resident in England (1763), also often reprinted. As a senator himself, or as a private person following at a distance the combats of St. Stephen's, Walpole recorded in a diary the chief incidents in English politics. If he was sometimes prejudiced, he rarely distorted the acts of those whom he disliked; and his prejudices, which lie on the surface, were mainly against those whom he considered traitors to his father. These diaries extend from 1750 to 1783, and cover a period of momentous importance. The *Memoirs of the Last Ten Years of the Reign of George II.* was edited by Lord Holland (1846); its successor, *Memoirs of the Reign of King George III.*, was edited by Sir Denis Le Marchant (4 vols., 1845), and re-edited in 1894 by G. F. Russell Barker; the last volumes of the series, *Journal of the Reign of George III. from 1771 to 1783*, were edited and illustrated by John Doran (2 vols., 1859), and were edited with an introduction by A. F. Steuart (London, 1909). To these works should be added the *Reminiscences* (2 vols., 1819), which Walpole wrote in 1788 for the Misses Berry. But Walpole was above all a letter-writer. His correspondents were numerous and widespread, but the chief of them were William Cole (1714–1782), the clerical antiquary of Milton; Robert Jephson, the dramatist; William Mason, the poet; Lord Hertford during his embassy in Paris; the countess of Ossory; Lord Harcourt; George Montagu, his friend at Eton; Henry Seymour Conway (1721–1795) and Sir Horace Mann. The *Letters* were published at different dates, but the standard collection is that by Mrs. Paget Toynbee (1903–1905), and to it should be added the volumes of the letters addressed to Walpole by his old friend Madame du Deffand (4 vols., 1810). A selection has been edited by W. S. Lewis (New York and London, 1926). Walpole has been called "the best letter-writer in the English language." His political estimates are more acute than his literary ones.



Abundant information about Horace Walpole will be found in the *Memoirs* of him and of his contemporaries edited by Eliot Warburton (1851), J. H. Jesse's *George Selwyn and his Contemporaries* (4 vols., 1843–44) and the extracts from the journals and correspondence of Miss Berry (3 vols., 1866); also *Horace Walpole and his World*, by L. B. Seeley (1884) and Austin Dobson, *Horace Walpole* (1890). It would be unpardonable to omit mention of Macaulay's sketch of Walpole's life and character. *See* also P. Yvon, *Horace Walpole, 1717–97. Essai de biographie psychologique et littéraire* (1924), and *Horace Walpole as Poet* (Paris, 1924); H. B. Wheatley in *Cambridge History of English Literature*, vol. 10 (1913); D. M. Stuart, *Horace Walpole* in *English Men of Letters* (1927).

WALPOLE, SIR ROBERT: *see* ORFORD, ROBERT WALPOLE, 1ST EARL OF.

WALPURGIS (WALPURGA or WALBURGA), **ST.** (d. *c.* 780), English missionary to Germany, was born in Sussex at the beginning of the 8th century. She was the sister of Willibald, the first bishop of Eichstätt in Bavaria, and Wunnibald, first abbot of Heidenheim. Her father, Richard, is thought to have been a son of Hlothere, 9th king of Kent; her mother, Winna or Wuna, a sister of St. Boniface. At the instance of Boniface and Willibald she went about 750 with some other nuns to found religious houses in Germany. Her first settlement was at Bischofsheim in the diocese of Mainz, and two years later (754) she became abbess of the Benedictine nunnery at Heidenheim in the diocese of Eichstätt. On the death of Wunnibald in 760 she succeeded him in his charge also, retaining the superintendence of both houses until her death. Her relics were translated to Eichstätt, where she was laid in a hollow rock, from which exuded a kind of bituminous oil afterwards known as Walpurgis oil, and regarded as of miraculous efficacy against disease. The cave became a place of pilgrimage, and a church was built over the spot. Walpurgis is commemorated at various times, but principally on the 1st of May, her day taking the place of an earlier heathen festival which was characterized by various rites marking the beginning of summer. She is regarded as the protectress against magic arts. (*Cf.* the Walpurgis-Nacht dance in Goethe's *Faust.*) In art she is represented with a crozier, and bearing in her hand a flask of balsam.

Her life was written by the presbyter Wolfhard and dedicated to Erkenbald, bishop of Eichstätt (884–916). *See* the Bollandist *Acta sanctorum*, vol. iii. February 25. On Walpurgis, Willibald and Wunnibald *see* G. F. Browne, *Boniface of Crediton and his Companions* (London, 1910), vii.

WALRUS or **MORSE** (*Odobaenus rosmarus*), a large marine mammal allied to the seals. Characterized by the prolongation, in both sexes, of the upper canine teeth into tusks, which may reach a length of 2ft., the adult walrus measures some 10 or 11ft. and is a heavily-built animal. The head is rounded, the eyes small, external ears absent. The short broad muzzle bears on each side a group of stiff, bristly whiskers. The tail scarcely projects beyond the skin. The fore-limbs are only free from the elbow and the fore-flipper is broad, flat and webbed. The hind-limbs, free from the heel, are fan-shaped. The skin is covered with short, rufous hair, which becomes very scanty in old animals. There are deep folds on the shoulder.

WALRUS OR WHALE HORSE (TRICHECHUS), FOUND ONLY IN THE NORTH

The walrus inhabits the northern circumpolar region in small herds. It prefers the coastal portions or ice-floes and feeds largely on bivalve molluscs which it digs up from the bottom of the sea with its tusks. Normally inoffensive and affectionate, when attacked the walrus can use its tusks with terrible effect and the herd usually combine against an enemy. Its principal foe, apart from man, is the polar bear, and its flesh is an important article of food to the Eskimo and Chukchi. Commercially the walrus is valuable for its oil, its hide and its ivory. The Pacific walrus, with longer and more slender tusks, has been separated as *O. obesus*. Like the Atlantic form, its numbers have been much reduced within recent years. Fossil walruses are known from the late Tertiary of the U.S.A., England, France and Belgium.

WALSALL, market town, Staffordshire, England, in the "Black Country." Pop. (1921) 96,926. The town stands high on a ridge on which is also the 15th century church of St. Matthew, now rebuilt.

Queen Mary's Schools are a foundation of 1554 and here were educated John Hough (1651–1743), the president of Magdalen College, Oxford, whom James II. sought to eject from office, afterwards Bishop of Oxford, Lichfield, and Worcester; and John, Lord Somers (1651–1716), Lord Keeper and Lord Chancellor of England. Walsall was the scene of the charitable work of Sister Dora (Miss Pattison), whom a statue commemorates. Coal, limestone and ironstone are mined in the neighbourhood. Walsall specializes in hardware and leather goods, gloves, electrical appliances, motor fittings. There are also iron and brass foundries. Three annual fairs are held. The parliamentary borough returns one member. Walsall (Waleshales, Walshall, Walsaler) was given in 996 to the church of Wolverhampton, which, however, did not retain it long. It was granted by Henry II. to Herbert Ruffus. Later the manor passed to the Bassets and the Beauchamps, and Warwick the king-maker held it in right of his wife. Henry VIII. granted it (1538) to Dudley, afterwards duke of Northumberland. Privileges were granted to the town by William Ruffus in the reign of John, and charters by Henry IV., Charles I. (1627) and Charles II. (1661) by which latter the town was governed until the Municipal Reform Act of 1835. It was not represented in parliament till 1832. Walsall had a merchant gild in 1390; in the 17th century it was already known for its manufacture of iron goods and nail-making. In the 18th century the staple industry was the making of chapes and shoe-buckles. Two fairs were granted in 1399. The Tuesday market, which is still held and two fairs on October 28 and May 6, were granted in 1417 to Richard Beauchamp, earl of Warwick.

WALSH, THOMAS JAMES (1859–), American lawyer and senator, was born in Two Rivers, Wis., on June 12, 1859, and educated at the University of Wisconsin (LL.B., 1884).

In the year 1912 he was elected U.S. senator, going directly to the Senate chamber from the lawyer's office without previous experience in public office. He was re-elected in 1918 and in 1924. He was five times a delegate to the Democratic national convention previous to 1924, in which year he presided as chairman of the convention. He was a presidential possibility in 1924, and was

offered the vice-presidency on the ticket with John W. Davis, but he declined. He was even more seriously spoken of in 1928 as the only strong alternative candidate to Alfred E. Smith, but before the convention met he signified his desire not to be considered. In the Senate he became an outstanding figure. His speeches, replete with facts and packed with close reasoning, made him a formidable adversary in debate. As an expert lawyer he was constantly called upon for advice. He aided in drafting the Prohibition and Woman-Suffrage amendments to the Constitution, and was also author of that part of the Federal Reserve Act which requires national banks to subscribe for stock in the Federal Reserve banks. He also formulated the case against the seating of Senator Truman H. Newberry, of Michigan. He is chiefly noted, however, for the tireless tenacity with which he prosecuted the investigation of circumstances surrounding the illegal leasing of Government oil reserves during Harding's Administration, an investigation which he took up after it previously had been dropped, and carried it through to overwhelming success. In 1928 he made a strong fight to have the financial status of light and power corporations investigated by a committee of the Senate, but was unsuccessful.

WALSH, WILLIAM JOHN (1841–1921), Roman Catholic divine, was born in Dublin Jan. 30, 1841. Educated in Dublin and at St. Patrick's college, Maynooth, in 1867 he was appointed professor of dogmatic and moral theology at Maynooth. In 1878 he became vice-president of the college and in 1881 succeeded Dr. Russell as president. Dr. Walsh served on several committees and commissions. He was partly responsible for the appointment of the commission to enquire into the working of the Queen's Colleges, and he became a member of the senate of the university. In 1885 he was summoned to Rome by the Pope and given the appointment of archbishop of Dublin. This office he continued to hold till his death in Dublin, on April 9, 1921. Dr. Walsh was a commissioner for education in Ireland (1891) and, a member (1908) of the Dublin statutory commission which established the Catholic National University, with himself as chancellor. In politics he was a Nationalist, but he strongly opposed compromise with the British Government, and after the rebellion of 1916 he supported the Sinn Feiners.

Dr. Walsh's published works include *A Plain Exposition of the Irish Land Act of 1881* (1881); *The Queen's Colleges and the Royal University of Ireland* (1883–84); *The Irish University Question* (1890).

WALSINGHAM, SIR FRANCIS (*c.* 1530–1590), English statesman, was the only son of William Walsingham, common serjeant of London (d. March 1534), by his wife Joyce, daughter of Sir Edmund Denny of Cheshunt. Francis matriculated as a fellow-commoner of King's college, Cambridge, of which Sir John Cheke was provost, in Nov. 1548; and he studied there amid strongly Protestant influences until Michaelmas 1550, when he appears to have gone abroad to complete his education. Returning in 1552 he was admitted at Gray's Inn on Jan. 28, 1553, but in 1555–56 he was at Padua, where he was admitted a "consiliarius" in the faculty of laws. Walsingham was twice married; in Jan. 1562 to Anne (d. 1564), daughter of George Barnes, lord mayor of London, and to Ursula, daughter of Henry St. Barbe and widow of Sir Richard Worsley. By his second wife Walsingham had a daughter who married firstly Sir Philip Sidney, secondly Robert Devereux, 2nd earl of Essex, and thirdly, Richard de Burgh, earl of Clanricarde.

Walsingham sat in Elizabeth's first and second parliaments for Banbury, and was attached to the party of Cecil. In 1567–70 he was supplying Cecil with information about the movements of foreign spies in London. Ridolfi, the conspirator, was committed to his custody in Oct. 1569. In the summer of 1570 he was, in spite of his protestations, designated to succeed Norris as ambassador at Paris. Walsingham was the ablest of the new men whom Cecil, having triumphed over the older aristocracy, brought to the front.

Embassy to Paris.—An essential element in the new policy was the substitution of an alliance with France for the old Burgundian friendship. The affair of San Juan de Ulua and the seizure of the Spanish treasure-ships in 1568 had been omens of the inevitable conflict with Spain; Ridolfi's plot and Philip II.'s approaches to Mary Stuart indicated the lines upon which the struggle would be fought; and it was Walsingham's business to reconcile the Huguenots with the French Government, and upon this reconciliation to base an Anglo-French alliance which might lead to a grand attack on Spain, to the liberation of the Netherlands, to the destruction of Spain's monopoly in the New World and to making Protestantism the dominant force in Europe. Walsingham threw himself heart and soul into the movement. He was the anxious fanatic of Elizabeth's advisers; he lacked the patience of Burghley and the cynical coolness of Elizabeth. He supplied the momentum which was necessary to counteract the caution of Burghley and Elizabeth; but it was probably fortunate that his headstrong counsels were generally overruled by the circumspection of his sovereign. He would have plunged England into war with Spain in 1572, when the risks would have been infinitely greater than in 1588, and when the Huguenot influence over the French Government, on which he relied for support, would probably have broken in his hands.

Walsingham, however, was an accomplished diplomatist, and he reserved these truculent opinions for the ears of his own Government, incurring frequent rebukes from Elizabeth. In his professional capacity, his attitude was correct enough; and, indeed, his anxiety for the French alliance and for the marriage between Elizabeth and Anjou led him to suggest concessions to Anjou's Catholic susceptibilities which came strangely from so staunch a Puritan. Although a defensive alliance was concluded between England and France in April 1572, the French Government perceived that public opinion in France would not tolerate an open breach with Spain in Protestant interests. The massacre of St. Bartholomew ruined all such hopes.

He was recalled in April 1573, and eight months later he was admitted to the privy council and made joint secretary of State with Sir Thomas Smith. He held this office jointly or solely until his death; in 1577 when Smith died, Dr. Thomas Wilson was associated with Walsingham; after Wilson's death in 1581 Walsingham was sole secretary until July 1586, when Davison began his brief and ill-fated seven months' tenure of the office. After Davison's disgrace in Feb. 1587 Walsingham remained sole secretary, though Wolley assisted him as Latin secretary from 1588 to 1590. He was also returned to parliament at a by-election in 1576 as knight of the shire for Surrey in succession to Charles Howard, who had become Lord Howard of Effingham, and he was re-elected for Surrey in 1584, 1586 and 1588. He was knighted on Dec. 1, 1577, and made chancellor of the order of the Garter on April 22, 1578.

State Secretary.—As secretary, Walsingham could pursue no independent policy; he was rather in the position of permanent under-secretary of the combined home and foreign departments, and he had to work under the direction of the council, and particularly of Burghley and the queen. He continued to urge the necessity of more vigorous intervention on behalf of the Protestants abroad, though now his clients were the Dutch rather than the Huguenots. In June 1578 he was sent with Lord Cobham to the Netherlands, mainly to glean reliable information on the complicated situation. In Aug. 1581 he was sent on a second and briefer mission to Paris. Its object was to secure a solid Anglo-French alliance against Spain without the condition upon which Henry III. insisted, namely a marriage between Elizabeth and Anjou. The French Government would not yield, and Walsingham came back, followed by Anjou, who pressed his claims in person. Walsingham's last embassy was to the court of James VI. in 1583, and here his vehement and suspicious Protestantism led him astray. Elizabeth and Burghley were inclined to try an alliance with the Scottish king, and the event justified their policy, which Walsingham did his best to frustrate, although deserted on this occasion by his chief regular supporter, Leicester.

For the rest of his life Walsingham was mainly occupied in detecting and frustrating the various plots formed against Elizabeth's life. He raised the English system of secret intelligence to a high degree of efficiency. At one time he is said to have had in his pay 53 agents at foreign courts, besides 18 persons whose

functions were even more obscure. Some of them were double spies, sold to both parties, whose real sentiments are still conjectural; but Walsingham was more successful in seducing Catholic spies than his antagonists were in seducing Protestant spies, and most of his information came from Catholics who betrayed one another. The most famous of the plots frustrated by Walsingham was Anthony Babington's, the discovery of which enabled him to bring pressure to bear upon Elizabeth to ensure Mary's execution. Walsingham died deeply in debt on April 6, 1590.

See K. Stählin, *Sir Francis Walsingham und seine Zeit* (Heidelberg, 1908, etc.); and C. Read, *Mr. Secretary Walsingham and the policy of Queen Elizabeth* (3 vols., 1925).

WALSINGHAM, THOMAS (d. *c.* 1422), English chronicler, was probably educated at the abbey of St. Albans and at Oxford. He became a monk at St. Albans, where he appears to have passed the whole of his monastic life except the six years between 1394 and 1400 during which he was prior of another Benedictine house at Wymondham, Norfolk. At St. Albans he was in charge of the scriptorium, or writing room, and he died about 1422. Walsingham's most important work is his *Historia Anglicana,* covering the period between 1272 and 1422. Some authorities hold that Walsingham himself only wrote the section between 1377 and 1392, but this view is controverted by James Gairdner in his *Early Chroniclers of Europe* (1879).

His most important works are *Historia Angliae brevis,* edit. by H. T. Riley (1863–64); *Chronicon Angliae,* edit. Sir E. M. Thompson (1874); *Gesta Abbatum Monasterii S. Albani,* edit. by T. H. Riley (1867–69); *Ypodigma Neustriae,* edit. by T. H. Riley (1876). All these editions are in the Rolls series.

WALTER, BRUNO (1876–), eminent German conductor, was born in Berlin on Sept. 15, 1876. He received his training in Berlin at the Stern Konservatorium; studied under Ehrlich, Buszler and Robert Radecke; and first appeared as conductor of opera at the Municipal theatre in Cologne. He then filled the same position in Hamburg, Breslau, Pressburg (Bratislava), Riga and Berlin, while from 1901 to 1912 he conducted the Court opera in Vienna. From 1913 to 1922, Walter was musical director at the Munich opera, and from 1925 until May 1929 he was the general musical director of the three Berlin opera houses.

WALTER, HUBERT (d. 1205), chief justiciar of England and archbishop of Canterbury, was a relative of Ranulf de Glanvill, the great justiciar of Henry II., and rose under the eye of his kinsman to an important position in the Curia Regis. In 1184 and in 1185 he appears as a baron of the exchequer. He was employed, sometimes as a negotiator, sometimes as a justice, sometimes as a royal secretary. He received no clerical promotion from Henry II., but Richard I. appointed him bishop of Salisbury, and by Richard's command he went with the third crusade to the Holy Land. He gained the respect of all the crusaders, and acted as Richard's principal agent in all negotiations with Saladin, being given a place in the first band of pilgrims that entered Jerusalem. He led the English army back to England after Richard's departure from Palestine; but in Sicily he heard of the king's captivity, and hurried to join him in Germany. In 1193 he returned to England to raise the king's ransom. Soon afterwards he was elected archbishop of Canterbury and made justiciar. He was very successful in the government of the kingdom, and after Richard's last visit he was practically the ruler of England. He had no light task to keep pace with the king's constant demand for money. He was compelled to work the administrative machinery to its utmost, and indeed to invent new methods of extortion. To pay for Richard's ransom, he had already been compelled to tax personal property, the first instance of such taxation for secular purposes. The main feature of all his measures was the novel and extended use of representation and election in government.

His chief measures are contained in his instruction to the itinerant justices of 1194 and 1198, in his ordinance of 1195 for the conservation of the peace, and in his scheme of 1198 for the assessment of the carucage. The justices of 1194 were to order the election of four coroners by the suitors of each county court. These new officers were to "keep," *i.e.,* to register, the pleas of the crown, an important duty hitherto left to the sheriff. The juries, both for answering the questions asked by the judges and for trying cases under the grand assize, were to be chosen by a committee of four knights, also elected by the suitors of each county court for that purpose. In 1195 Hubert issued an ordinance by which four knights were to be appointed in every hundred to act as guardians of the peace, and from this humble beginning eventually was evolved the office of justice of the peace. His reliance upon the knights, or middle-class landowners, who now for the first time appear in the political foreground, is all the more interesting because it is this class who, either as members of parliament or justices of the peace, were to have the effective rule of England in their hands for so many centuries.

In 1198, to satisfy the king's demand for money, Hubert demanded a carucage or plough-tax of five shillings on every ploughland (carucate) under cultivation. This was the old tax, the Danegeld, in a new and heavier form and there was great difficulty in levying it. To make it easier, the justiciar ordered the assessment to be made by a sworn jury in every hundred, and one may reasonably conjecture that these jurors were also elected. Hubert negotiated a peace with Scotland in 1195, and in 1197 another with the Welsh. But the carucage was not a success, and the Great Council refused to equip a force of knights to serve abroad.

In 1198 Hubert, who had inherited from his predecessors in the primacy a fierce quarrel with the Canterbury monks, gave these enemies an opportunity of complaining to the pope, for in arresting the London demagogue, William Fitz Osbert, he had committed an act of sacrilege in Bow Church, which belonged to the monks. The pope asked Richard to free Hubert from all secular duties, and he did so, thus making the demand an excuse for dismissing Hubert from the justiciarship. On May 27, 1199, Hubert crowned John, making a speech in which the old theory of election by the people was enunciated for the last time. He also took the office of chancellor and cheerfully worked under Geoffrey Fitz Peter, one of his former subordinates. In 1201 he went on a diplomatic mission to Philip Augustus of France, and in 1202 he returned to England to keep the kingdom in peace while John was losing his continental possessions. In 1205 he died. Hubert was an ingenious, original and industrious public servant, but he was grasping and perhaps dishonest.

See W. Stubbs, *Constitutional History,* vol. i. (1897); Miss K. Norgate's *England under the Angevin Kings,* vol. ii. (1887); W. Stubbs, preface to vol. iv. of Roger of Hoveden's *Chronicle* ("Rolls" series, 1868–71).

WALTER, JOHN (1738/9–1812), founder of *The Times* newspaper, London, was born in 1738/9, probably in London, and from the death of his father, Richard Walter (about 1755/6), until 1781 was engaged in a prosperous business as a coal merchant. He played a leading part in establishing a Coal Exchange in London; but shortly after 1781, when he began to occupy himself solely as an underwriter and became a member of Lloyd's, he over-speculated and failed. In 1782 he bought from one Henry Johnson a patent for a new method of printing from "logotypes" (*i.e.,* founts of words or portions of words, instead of letters), and made some improvements in it. In 1784 he acquired an old printing office in Blackfriars, which formed the nucleus of the Printing-house Square of a later date, and established there his "Logographic Office." At first he only undertook the printing of books, but on Jan. 1, 1785 he started a small newspaper called *The Daily Universal Register,* which on reaching its 940th number on Jan. 1, 1788 was renamed *The Times.*

The printing business developed and prospered, but the newspaper at first had a somewhat chequered career. In 1789 Walter was tried for a libel in it on the duke of York, and was sentenced to a fine of £50, a year's imprisonment in Newgate, to stand in the pillory for an hour and to give surety for good behaviour for seven years; and for further libels the fine was increased by £100, and the imprisonment by a second year. On March 9, 1791, however, he was liberated and pardoned. In 1799 he was again convicted for a technical libel, this time on Lord Cowper. He had then given up the management of the business to his eldest son, William, and had (1795) retired to Teddington, where he died on Nov. 16, 1812. In 1759 he had married Frances Landen (died 1798), by whom he had six children. In 1803 William Walter

transferred the sole management to his younger brother, John.

JOHN WALTER (2) (1776–1847), who really established the great newspaper of which his father had sown the seed, was born on Feb. 23, 1776, and was educated at Merchant Taylors' School and Trinity College, Oxford. He found *The Times* one of a number of unconsidered journals whose opinions counted for little. He left it in 1847 a great organ of public opinion, deferred to and even feared throughout Europe, consulted and courted by cabinet ministers at home, and in intimate relations with the best sources of independent information in every European capital. On taking over the management in 1803, he signalized the new spirit of the direction by his opposition to Pitt, which cost him the withdrawal of government advertisements and the loss of his appointment as printer to the Customs, and exposed him to the not too scrupulous hostility of the official world. He let the government do its worst and held on his way. From about 1810 he delegated to others editorial supervision (first to Sir John Stoddart, then to Thomas Barnes, and in 1841 to J. T. Delane), though never the supreme direction of policy. In 1832 Mr. Walter, who had purchased an estate called Bear Wood, in Berkshire (where his son afterwards built the present house), was elected to Parliament for that county, and retained his seat till 1837. In 1841 he was returned to Parliament for Nottingham, but was unseated next year on petition. He was twice married, and by his second wife, Mary Smythe, had a family. He died in London on July 28, 1847.

JOHN WALTER (3) (1818–1894), his eldest son, was born at Printing-house Square in 1818, and was educated at Eton and Exeter College, Oxford, being called to the bar in 1847. On leaving Oxford he took part in the business management of *The Times*, and on his father's death became sole manager, though he devolved part of the work on Mowbray Morris. It was under him that the successive improvements in the printing machinery, begun by his father in 1814, at last reached the stage of the "Walter Press" in 1869, the pioneer of modern newspaper printing-presses. In 1847 he was elected to parliament for Nottingham as a moderate Liberal, and was re-elected in 1852 and in 1857. In 1859 he was returned for Berkshire, and though defeated in 1865, was again elected in 1868, and held the seat till he retired in 1885. He died on Nov. 3, 1894. He was twice married, first in 1842 to Emily Frances Court (d. 1858), and secondly in 1861 to Flora Macnabb. His eldest son by the first marriage, John, was accidentally drowned at Bear Wood in 1870; and he was succeeded by Arthur Fraser Walter (1846–1910), his second son by the first marriage. A. F. Walter remained chief proprietor of *The Times* till 1908, when it was converted into a company. He then became chairman of the board of directors, and on his death was succeeded in this position by his son John, who entered the *Times* office in 1898, and was chairman of the directors from 1910 to 1923. John Walter's son, Hubert Walter (b. 1870) joined the staff in 1894 and has acted as special representative in Paris and elsewhere.

(For changes in the management of *The Times* since 1908 *see* NEWSPAPERS: *British.*) (H. C.; X.)

WALTER, LUCY (*c.* 1630–1658), mistress of the English king Charles II. and mother of the duke of Monmouth (*q.v.*), was born at Roch Castle, near Haverfordwest. Her home having been captured and burned by the Parliamentary forces in 1644, Lucy Walter found shelter first in London and then at The Hague. There, in 1648, she met Charles, possibly renewing an earlier acquaintance. Their intimacy lasted with intervals till the autumn of 1651, and Charles claimed the paternity of a child born in 1649, whom he subsequently created duke of Monmouth.

See Steinmann, *Althorp Memoirs* (1869), pp. 77 *seq.* and *Addenda* (1880); J. S. Clarke, *Life of James II.* (2 vols., 1816); *Clarendon State Papers*, vol. iii. (Oxford, 1869–76); John Evelyn, *Diary*, edited by W. Bray (1890); and Mme. d'Aulnoy, *Memoirs of the Court of England in 1675*, edited by G. D. Gilbert (1913).

WALTER OF COVENTRY (*fl.* 1290), English monk and chronicler, who was apparently connected with a religious house in the province of York, is known to us only through the historical compilation which bears his name, the *Memoriale fratris Walteri de Coventria.* The word *Memoriale* is usually taken to mean "commonplace book." Some critics interpret it in the sense of "a souvenir," and argue that Walter was not the author but merely the donor of the book; but the weight of authority is against this view. The author of the *Memoriale* lived in the reign of Edward I., and mentions the homage done to Edward as overlord of Scotland (1291). Since the main narrative extends only to 1225, the *Memoriale* is emphatically a second-hand production. But for the years 1201–1225 it is a faithful transcript of a contemporary chronicle, the work of a Barnwell canon. A complete text of the Barnwell work is preserved in the College of Arms (Heralds' College, ms. 10), and was collated by Bishop Stubbs for his edition.

The Barnwell annalist, living in Cambridgeshire, was well situated to observe the events of the barons' war, and is our most valuable authority for that important crisis. He is less hostile to John than are Ralph of Coggeshall, Roger of Wendover and Matthew Paris. He praises the king's management of the Welsh and Scottish wars; he is critical in his attitude towards the pope and the English opposition; he regards the submission of John to Rome as a skilful stroke of policy, although he notes the fact that some men called it a humiliation. The constitutional agitation of 1215 does not arouse his enthusiasm; he passes curtly over the Runnymede conference, barely mentioning Magna Carta. Probably, the middle classes, whom he represents, regarded the designs of the feudal baronage with suspicion.

See W. Stubbs's edition of Walter of Coventry ("Rolls" series, 2 vols., 1872–73); R. Pauli, in *Geschichte von England* (Hamburg, 1853), iii. 872. (H. W. C. D.)

WALTHAM, a city of Middlesex county, Massachusetts, U.S.A., on the Charles river. Pop. in 1920, 30,915 (26% foreign-born white); 1928 local estimate 38,000. The city occupies a series of rugged hills rising on both sides of the river. Prospect hill (482 ft.), in a park of 100 ac., commands a magnificent view. There is a large central common, and parts of the Beaver Brook Reservation (including the "Waverley Oaks") and the Charles River Reservation are within the limits. Waltham is the seat of the Massachusetts school for the feeble-minded, the first institution of its kind in the country (established in Boston in 1848). Also it has the largest watch factory in the world (employing over 3,000 persons), large cotton mills and many other manufacturing industries, with an aggregate output in 1925 valued at $19,672,096. The town was incorporated in 1738, and in 1884 it was chartered as a city. The first power mill used in the manufacture of cotton cloth in America was established here in 1814. Before the establishment of the U.S. observatory at Washington the watch company maintained an elaborate observatory for testing and setting its watches.

WALTHAM ABBEY or **WALTHAM HOLY CROSS,** a market town in Essex, England, on the Lea, and on the Cambridge branch of the L.N.E.R. Pop. (1921) 6,847. Of the former magnificent cruciform abbey church the only portion of importance now remaining is the nave, forming the present parish church, the two easternmost bays being converted into the chancel. It is a very fine specimen of ornate Norman. On the south side of the church is a lady chapel dating from the end of the reign of Edward II. or the beginning of that of Edward III., containing some good Decorated work, with a crypt below. Of the monastic buildings there remain only a bridge and gateway and other slight fragments. At Waltham Cross, about 1 m. W. of Waltham in Hertfordshire, is the beautiful cross erected (1291–94) by Edward I. at one of the resting-places of the corpse of Queen Eleanor on its way to burial in Westminster Abbey. The royal gun-powder factory is in the immediate vicinity; government works were built in 1890 at Quinton Hill, ½ m. W. of the town, for the manufacture of cordite; and the town possesses gun-cotton and percussion-cap factories, flour-mills, malt kilns and breweries. Watercress is extensively grown in the neighbourhood, and there are market gardens and nurseries.

WALTHAMSTOW, a suburb of London. Population (1921) 129,395. The church of St. Mary existed at a very early period, but the present building, chiefly of brick, was erected in 1535. Besides other old brasses it contains in the north aisle the effigies in brass of Sir George Monoux (d. 1543) and Anne his wife. There are a number of educational institutions, including a school

of art; Forest school, founded in 1834 in connection with King's college, now ranks as one of the well-known English public schools. Brewing is extensively carried on. In the reign of Edward the Confessor Walthamstow belonged to Waltheof, son of Siward, earl of Northumberland, who married Judith, niece of William the Conqueror, who betrayed him to his death in 1075. The estate subsequently passed in 1309 to Guy de Beauchamp, earl of Warwick. It is supposed to have been the birthplace of George Gascoigne the poet (d. 1577).

WALTHARIUS, a Latin poem founded on German popular tradition, relates the exploits of the west Gothic hero Walter of Aquitaine. Our knowledge of the author, Ekkehard, a monk of St. Gall, is due to a later Ekkehard (Ekkehard IV., d. 1060), who gives some account of him in the *Casus Sancti Galli* (cap. 80). The poem is said to have been by Ekkehard I. (d. 973) in his schooldays for his master Geraldus. If so, he must have possessed precocious powers. *Waltharius* was dedicated by Geraldus to Erchanbald, bishop of Strasbourg (*fl.* 965–991), but mss. were in circulation before that time. Ekkehard IV. stated that he corrected his namesake's Germanisms. The poem was probably based on epic songs now lost.

Walter was the son of Alphere, ruler of Aquitaine, which in the 5th century was a province of the west Gothic Spanish kingdom. On Attila's invasion the western princes are represented as offering tribute and hostages. Gibich, here described as a Frankish king, gave Hagen as a hostage in place of his son Gunther; the Burgundian Heririh, his daughter Hiltegund; and Alphere, his son Walter. Hagen and Walter became brothers in arms, fighting for Attila, while Hiltegund was put over the queen's treasure. Presently Gunther succeeded his father and refused the tribute, whereupon Hagen fled from Attila's court. Walter and Hiltegund, who had been betrothed in childhood, also escaped, taking with them a great treasure. The story of their flight forms one of the most charming pictures of old German story. At Worms, however, the treasurer excited the cupidity of Gunther. Taking 12 knights, among them the reluctant Hagen, he overtook them at the Wasgenstein (Vosges). Walter engaged the Nibelungs one at a time, until all were slain but Hagen, who held aloof and was only persuaded by Gunther on the second day to attack his comrade. Luring Walter from the strong position of the day before, Gunther and Hagen attacked. All three were incapacitated, but their wounds were bound up by Hiltegund.

The essence of the story is the series of single combats. The incoherences make it likely that many changes have been introduced in the legend. *Thidreks Saga* makes the story more probable by representing the pursuers as Huns. Probably Hagen was originally the father of Hiltegund, and the tale was a variant of the saga of Hild in *Skaldskaparmál*. Hild, daughter of King Högni, was carried off by Hedinn. The fight between father and lover only ceased at sundown, to be renewed on the morrow, since each evening Hild raised the dead by her incantations. This is obviously a mediaeval variant of the ancient myth of the struggle between light and darkness.

BIBLIOGRAPHY.—*Waltharius* was first edited by Fischer (Leipzig, 1780). Later and more critical editions are by Jacob Grimm (*Lat. Gedichte des Mittelalters,* Göttingen, 1838); R. Peiper (1873); V. Scheffel and A. Holder (Stuttgart, 1874); German translations by F. Linnig (Paderborn, 1885), and H. Althof (Leipzig, 1896). *See* also Scheffel's novel of *Ekkehard* (Stuttgart, 1887). The A.S. fragments of *Waldere* were first edited by G. Stephens (1860), afterwards by R. Wülker in *Bibl. der angel-sachs. Poesie* (Cassel, 1881); by F. Holthausen in *Göteborgs Högskolas Årsskrift* (vol. v., 1899), with autotype reproductions of the two leaves which have been preserved. *See* also A. Ebert, *Allg. Gesch. der Lit. des Mittelalters im Abendlande* (Leipzig, 1874–87); R. Koegel, *Gesch. der deutschen Literatur bis zum Ausgange des Mittelalters* (vol. i., pt. ii., Strasbourg, 1897); M. D. Larned, *The Saga of Walter of Aquitaine* (Baltimore, 1892); B. Symons, *Deutsche Heldensage* (Strasbourg, 1905). With *Waltharius* compare the ballads "Earl Brand" and "Erlinton" (F. J. Child, *English and Scottish Popular Ballads,* i. 88 *seq.*); and *see* R. W. Chambers, *Widsith* (1912).

WALTHEOF (d. 1076), earl of Northumbria, was a son of Earl Siward of Northumbria, and, although he was probably educated for a monastic life, became earl of Huntingdon and Northampton about 1065. After the battle of Hastings he submitted to William the Conqueror; but when the Danes invaded the north of England in 1069 he joined them and took part in the attack on York, only, however, to make a fresh submission after their departure in 1070. Then, restored to his earldom, he married William's niece, Judith, and in 1072 was appointed earl of Northumbria. In 1075 Waltheof joined the conspiracy against the king arranged by the earls of Norfolk and Hereford; but soon repenting of his action he confessed his guilt to Archbishop Lanfranc, and then to William, who was in Normandy. Returning to England with William he was arrested, and after being brought twice before the king's court was sentenced to death. On May 31, 1076, he was beheaded on St. Giles's Hill, near Winchester. Weak and unreliable in character, Waltheof, like his father, is said to have been a man of immense bodily strength. Devout and charitable, he was regarded by the English as a martyr, and miracles were said to have been worked at his tomb at Crowland. The earl left three daughters, the eldest of whom, Matilda, brought the earldom of Huntingdon to her second husband, David I., king of Scotland. One of Waltheof's grandsons was Waltheof (d. 1159), abbot of Melrose.

See E. A. Freeman, *The Norman Conquest,* vols. ii., iii. and iv. (1870–76).

WALTHER VON DER VOGELWEIDE (*c.* 1170–*c.* 1230), the most celebrated of mediaeval German lyric poets. For all his fame, Walther's name is not found in contemporary records, with the exception of a solitary mention in the travelling accounts of Bishop Wolfger of Passau—"Walthero cantori de Vogelweide pro pellicio V. solidos longos"—"To Walther the singer of the Vogelweide five shillings to buy a fur coat," and the main sources of information about him are his own poems and occasional references by contemporary Minnesingers. It is clear from the title *hêr* (Herr, Sir) these give him, that he was of noble birth; but it is equally clear from his name Vogelweide (Lat. *aviarium,* a gathering place or preserve of birds) that he belonged not to the higher nobility, who took their titles from castles or villages, but to the nobility of service (*Dienstadel*), humble retainers of the great lords, who in wealth and position were little removed from non-noble free cultivators. For a long time the place of his birth was a matter of dispute, until Professor Franz Pfeiffer established beyond reasonable doubt that he was born in the Wipthal in Tirol, where, not far from the little town of Sterzing on the Eisak, a wood—called the Vorder- und Hintervogelweide—preserves at least the name of his vanished home.

Tirol was at this time the home of several noted Minnesingers; and the court of Vienna, under the enlightened duke Frederick I. of the house of Babenberg, had become a centre of poetry and art. Here it was that the young poet learned his craft under the renowned master Reinmar the Old, whose death he afterwards lamented in two of his most beautiful lyrics; and in the open-handed duke he found his first patron. This happy period of his life, during which he produced the most charming and spontaneous of his love-lyrics, came to an end with the death of Duke Frederick in 1198. Henceforward Walther was a wanderer from court to court in many Germanic countries, singing for his lodging.

For material success in this profession he was hardly calculated. His criticism of men and manners was scathing; and even when this did not touch his princely patrons, their underlings often took measures to rid themselves of so uncomfortable a censor. Thus he was forced to leave the court of the generous duke Bernhard of Carinthia (1202–1256); after an experience of the tumultuous household of the landgrave of Thuringia he warns those who have weak ears to give it a wide berth; and after three years at the court of Dietrich I. of Meissen (reigned 1195–1221) he complains that he had received for his services neither money nor praise. Walther was, in fact, a man of strong views; and it is this which gives him his main significance in history, as distinguished from his place in literature. From the moment when the death of the emperor Henry VI. (1197) opened the fateful struggle between empire and papacy, Walther threw himself ardently into the fray on the side of German independence and unity. Though his religious poems sufficiently prove the sincerity of his catholicism, he remained to the end of his days opposed to the extreme claims of the popes, whom he attacks with a bitterness

which can only be justified by the strength of his patriotic feelings. His political poems begin with an appeal to Germany, written in 1198 at Vienna, against the disruptive ambitions of the princes:—

Crown Philip with the Kaiser's crown
And bid them vex thy peace no more.

He was present, on Sept. 8, at Philip's coronation at Mainz, and supported him till his victory was assured. After Philip's murder in 1209, he "said and sang" in support of Otto of Brunswick against the papal candidate Frederick of Staufen; and only when Otto's usefulness to Germany had been shattered by the battle of Bouvines (1212) did he turn to the rising star of Frederick II., now the sole representative of German majesty against pope and princes. From the new emperor his zeal for the empire at last received recognition; and a small fief in Franconia was bestowed upon him, which, though he complained that its value was little, gave him the home and the fixed position he had so long desired. That Frederick gave him an even more signal mark of his favour by making him the tutor of his son Henry VII., is more than doubtful. Walther's restless spirit did not suffer him to remain long on his new property. In 1217 we find him once more at Vienna, and again in 1219 after the return of Duke Leopold VI. from the crusade. About 1224 he seems to have settled on his fief near Würzburg. He was active in urging the German princes to take part in the crusade of 1228, and may have accompanied the crusading army at least as far as his native Tirol. In a beautiful and pathetic poem he paints the change that had come over the scenes of his childhood and made his life seem a thing dreamed. He died about 1230, and was buried at Würzburg, after leaving directions, according to the story, that the birds were to be fed at his tomb daily.

Historically interesting as Walther's political verses are, their merit has been not a little exaggerated. Of more lasting value are the beautiful lyrics, mainly dealing with love, which led his contemporaries to hail him as their master in song (*unsers sanges meister*). He is of course unequal. At his worst he does not rise above the tiresome conventionalities of his school. At his best he shows a spontaneity, a charm and a facility which his rivals sought in vain to emulate. His earlier lyrics are full of the joy of life, of feeling for nature and of the glory of love. Greatly daring, he even rescues love from the convention which had made it the prerogative of the nobly born, and puts the most beautiful of his lyrics—*Unter der linden*—into the mouth of a simple girl.

A certain seriousness, which is apparent under the joyousness of his earlier work, grew on him with years. Religious and didactic poems become more frequent; and his verses in praise of love turn at times to a protest against the laxer standards of an age demoralized by political unrest. Throughout his attitude is healthy and sane. He preaches the crusade; but at the same time he suggests the virtue of toleration, pointing out that in the worship of God

Christians, Jews and heathen all agree.

He fulminates against "false love"; but pours scorn on those who maintain that "love is sin." In an age of monastic ideals and loose morality there was nothing commonplace in the simple lines in which he sums up the inspiring principle of chivalry at its best:—

Swer guotes wîbes liebe hât
Der schamt sich ieder missetât.[1]

The *Gedichte* were edited by Karl Lachmann (1827). This edition of the great scholar was re-edited by M. Haupt (3rd ed., 1853). *Walther v. d. Vogelweide*, edited by Franz Pfeiffer, with introduction and notes (4th edition, by Karl Bartsch, Leipzig, 1873). *Glossarium zu d. Gedichten Walther's, nebst e. Reimverzeichnis*, by C. A. Hornig (Quedlinburg, 1844). There are translations into modern German by B. Obermann (1886), and into English verse *Selected poems of Walter von der Vogelweide* by W. Alison Phillips, with introduction and notes (London, 1896). The poem *Unter der Linden*, not included in the latter, was freely translated by T. L. Beddoes (*Works*, 1890), more closely by W. A. Phillips in the *Nineteenth Century* for July 1896 (ccxxxiii. p. 70). *Songs and Sayings* contains English translations of Walther's poems, by F. Belts (1917). *Leben u. Dichten Walther's von der Vogelweide*, by Wilhelm Wilmanns (Bonn, 1882), is a valuable critical study of the poet's life and works. *See* also E. Gaertner, *Die Epitheta bei Walther von der Vogelweide* (1901); R. Wustman, *Walther von der Vogelweide* (1913); A. Debrit-Vogel, *Die Gedichte Walthers von der Vogelweide in neuhochdeutscher Form* (1922).

(W. A. P.)

[1] He who has the love of a good woman
Is ashamed of every misdeed.

WALTON, IZAAK (1593–1683), English writer, author of *The Compleat Angler*, was born at Stafford on Aug. 9, 1593; the register of his baptism gives his father's name as Jervis, and nothing more is known of his parentage. He settled in London as an ironmonger, and at first had one of the small shops, 7½ ft. by 5 ft., in the upper storey of Gresham's Royal Burse or Exchange in Cornhill. In 1614 he had a shop in Fleet Street, two doors west of Chancery Lane. Here, in the parish of St. Dunstan's, he gained the friendship of Dr. John Donne, then vicar of that church. His first wife, Rachel Floud, great-great-niece of Archbishop Cranmer, died in 1640. He married again soon after, his second wife being Anne Ken—the pastoral "Kenna" of *The Angler's Wish*—step-sister of Thomas Ken, afterwards bishop of Bath and Wells. After the Royalist defeat at Marston Moor, he retired from business. He had bought some land near his birthplace, Stafford, and he went to live there; but, according to Wood, spent most of his time "in the families of the eminent clergymen of England, of whom he was much beloved"; and in 1650 he was again living in Clerkenwell.

In 1653 came out the first edition of his famous book, *The Compleat Angler*. His second wife died in 1662, and was buried in Worcester cathedral church, where there is a monument to her memory. One of his daughters married Dr. Hawkins, a prebendary of Winchester. The last forty years of his long life seem to have been spent in ideal leisure and occupation, the old man travelling here and there, visiting his "eminent clergymen" and other brethren of the angle, compiling the biographies of congenial spirits, and collecting here a little and there a little for the enlargement of his famous treatise. After 1662 he found a home at Farnham Castle with George Morley, bishop of Winchester, to whom he dedicated his *Life* of George Herbert and also that of Richard Hooker; and from time to time he visited Charles Cotton in his fishing house on the Dove. He died in his daughter's house at Winchester on Dec. 15, 1683, and was buried in the cathedral. It is characteristic of his kindly nature that he left his property at Shalford for the benefit of the poor of his native town.

Walton hooked a much bigger fish than he angled for when he offered his quaint treatise, *The Compleat Angler*, to the public. There is hardly a name in English literature, even of the first rank, whose immortality is more secure, or whose personality is the subject of a more enthusiastic cult. *The Compleat Angler*, dedicated to his friend John Offley, was published in 1653, but Walton continued to add to its completeness in his leisurely way for a quarter of a century. Later editions appeared during his lifetime, in 1655, 1661, 1668 and 1676. In the 1676 edition the thirteen chapters of the original had grown to twenty-one, and a second part was added by his brother angler Charles Cotton, who took up "Venator" where Walton had left him and completed his instruction in fly-fishing and the making of flies.

Walton did not profess to be an expert with the fly; the fly-fishing in his first edition was contributed by Thomas Barker, a retired cook and humorist, who produced a treatise of his own in 1659; but in the use of the live worm, the grasshopper and the frog "Piscator" himself could speak as a master. The famous passage about the frog—often misquoted about the worm—"use him as though you loved him, that is, harm him as little as you may possibly, that he may live the longer"—appears in the original edition. The additions made as the work grew were not merely to the technical part; happy quotations, new turns of phrase, songs, poems and anecdotes were introduced as if the leisurely author, who wrote it as a recreation, had kept it constantly in his mind and talked it over point by point with his numerous brethren. There were originally only two interlocutors in the opening scene, "Piscator" and "Viator"; but in the second edition, as if in answer to an objection that "Piscator" had it too much his own way in praise of angling, he introduced the falconer, "Auceps," changed "Viator" into "Venator" and made

the new companions each dilate on the joys of his favourite sport.

Although *The Compleat Angler* was not Walton's first literary work, his leisurely labours as a biographer seem to have grown out of his devotion to angling. It was probably as an angler that he made the acquaintance of Sir Henry Wotton, but it is clear that Walton had more than a love of fishing and a humorous temper to recommend him to the friendship of the accomplished ambassador. At any rate, Wotton, who had intended to write the life of John Donne, and had already corresponded with Walton on the subject, left the task to him. Walton had already contributed an *Elegy* to the 1633 edition of Donne's poems, and he completed and published the life, much to the satisfaction of the most learned critics, in 1640. Sir Henry Wotton dying in 1639, Walton undertook his life also; it was finished in 1642 and published in 1651. His life of Hooker was published in 1662, that of George Herbert in 1670 and that of Bishop Sanderson in 1678.

The Lives of Dr. John Donne, Sir Henry Wotton, Mr. Richard Hooker, Mr. George Hooker, etc., was published in 1670. This, together with the life of Robert Sanderson was edited by George Saintsbury in 1927. All these subjects were endeared to the biographer by a certain gentleness of disposition and cheerful piety; three of them at least—Donne, Wotton and Herbert—were anglers. Their lives were evidently written with loving pains, in the same leisurely fashion as his *Angler,* and like it are of value less as exact knowledge than as harmonious and complete pictures of character. Walton also rendered affectionate service to the memory of his friends Sir John Skeffington and John Chalkhill, editing with prefatory notices Skeffington's *Hero of Lorenzo* in 1652 and Chalkhill's *Thealma and Clearchus* a few months before his own death in 1683. His poems and prose fragments were collected in 1878 under the title of *Waltoniana.*

The best-known old edition of the *Angler* is J. Major's (2nd ed., 1824, repr. 1927). A facsimile of the first edition was reprinted in 1928 by A. and C. Black. The book was edited by Andrew Lang in 1896, and various modern editions have appeared. The standard biography is that by Sir Harris Nicolas, prefixed to an edition of the *Angler* (1836). There are notices also, with additional scraps of fact, annexed to two American editions, Bethune's (1847) and Dowling's (1857). An edition of Walton's *Lives,* by G. Sampson, appeared in 1903. *See* also T. Westwood, *The Chronicle of the "Compleat Angler" of Izaak Walton and C. Cotton* (1864); *Izaak Walton and his Friends,* by S. Martin (1903); E. Marston, *Thomas Ken and Izaak Walton: etc.* (1908); R. B. Marston, *Walton and some earlier writers on Fish and Fishing* (1909).

WALTON-LE-DALE, urban district, in the Fylde parliamentary division, Lancashire, England. Pop. (1921) 12,156, area 4,656 acres. The church of St. Leonard was originally erected in the 11th century, the earliest portions of the present building being Perpendicular in style. Cotton-spinning is carried on. Roman remains have been found here, probably indicating a roadside post. The manor of Walton was granted by Henry de Lacy about 1130 to Robert Banastre. It afterwards passed to the Langtons, and about 1592 to the Hoghtons of Hoghton. Walton was the principal scene of the great battle of Preston (Aug. 17, 1648). In 1715 the passage of the Ribble was bravely defended against the Jacobites by Parson Woods and his parishioners of Atherton (*q.v.*).

WALTON-ON-THAMES, an urban district in the Chertsey parliamentary division of Surrey, England, pleasantly situated on the right bank of the Thames, 17 m. W.S.W. from London by the S. railway. Pop. (1921), 14,644. The church of St. Mary has late Norman portions, and contains numerous memorials, including examples of the work of Chantrey and Roubiliac. A verse inscribed upon a pillar is reputed to be Queen Elizabeth's profession of faith as regards transubstantiation. The queen was a frequent resident at Henry VIII.'s palace of Oatlands park, which was destroyed during the civil wars of the 17th century.

WALTON-ON-THE-NAZE or **WALTON-LE-SOKEN** a watering-place in Essex, 71½ m. E.N.E. from London. Pop. (1921) 3,664. This portion of the coast has suffered from encroachment of the sea, and a part of the old village of Walton, with the church, was engulfed towards the end of the 18th century. On the east side of the town is the open North sea, with a fine stretch of sand and shingle, affording good bathing. To the west is an irregular inlet studded with low islands, known as Hanford water. The Naze is a promontory 2 m. N. by E. of the town, and in the vicinity of Walton are low cliffs exhibiting the fossiliferous red crag formation.

WALTZ, a popular round dance, introduced from Germany into France at the end of the 18th century and into England in 1812. Ridiculed at first, it soon achieved unequalled popularity and survives to the present, with some variations in tempo and movement. It is written in ¾ time and has enlisted the musical interest of many composers, the most famous of whom are the Strauss family of Vienna. (*See* also DANCE.)

WALVIS BAY, a harbour on the coast of south-west Africa. When separated politically from the hinterland, practically no development took place. South-west Africa, under the former German rule, relied on Swakopmund. Now that the area is administered as part of the mandated territory, the port of Walvis Bay is beginning to develop. Vessels can now lie alongside a concrete wharf, 1,500 ft. long, to which leads a channel, 30 ft. deep. The wharf is fitted with electric cranes. A cold storage and refrigerating plant has been erected, capable of dealing with 150 cattle and 200 or 300 sheep *per diem;* and considerable quantities of chilled meat are exported. Whaling and fishing are also carried on. Walvis Bay is now a regular port of call for mail steamers of British, Dutch and German lines. In consequence of the development of Walvis Bay, Swakopmund has been permanently closed as a port. The population of Walvis Bay is about 2,000, including about 600 whites.

WALWORTH, SIR WILLIAM (d. 1385), lord mayor of London, belonged to a good Durham family. He was apprenticed to John Lovekyn, a member of the Fishmongers' Gild, and succeeded his master as alderman of Bridge ward in 1368, becoming sheriff in 1370 and lord mayor in 1374. He is said to have suppressed usury in the city during his term of office as mayor. His name frequently figures as advancing loans to the king, and he supported John of Gaunt, duke of Lancaster, in the city, where there was a strong opposition to the king's uncle. His most famous exploit was his encounter with Wat Tyler in 1381, during his second term of office as lord mayor. In June of that year, when Tyler and his followers entered south London, Walworth defended London Bridge against them; he was with Richard II. when he met the insurgents at Smithfield, and assisted in slaying their leader (*see* TYLER, WAT), afterwards raising the city bodyguard in the king's defence; for which service he was rewarded by knighthood and a pension. He subsequently served on two commissions to restore the peace in the county of Kent. He died in 1385, and was buried in St. Michael's, Crooked Lane.

See William Herbert, *The History . . . of St. Michael, Crooked Lane, London . . .* (1831); W. and R. Woodcock, *Lives of Illustrious Lord Mayors* (1846); an account of Wat Tyler's rebellion in a fragment printed by G. H. Trevelyan in the *Eng. Hist. Review* (July 1898).

WAMPUM or **WAMPUM-PEAGE** (Amer. Ind. *wampam,* "white"; *peag,* "bead"), the shell-money of the North American Indians. It consisted of beads made from shells, and required a considerable measure of skill in its manufacture. Wampum was of two colours, dark purple and white, of cylindrical form, averaging a quarter of an inch in length, and about half that in diameter. Its colour determined its value. The term wampum or wampum-peage was apparently applied to the beads only when strung or woven together. They were ground as smooth as glass and were strung together by a hole drilled through the centre. Dark wampum, which was made from a "hard shell" clam (*Venus mercenaria*), popularly called quahang or quahog, a corruption of the Indian name, was the most valuable. White wampum was made from the shell of whelks. Wampum was employed most in New England, but it was common elsewhere. By the Dutch settlers of New York it was called *seawan* or *zeewand,* and *roenoke* in Virginia, and perhaps farther south, for shell-money was also known in the Carolinas, but whether the *roenoke* of the Virginian Indians was made from the same species of shell as wampum is not clear. Cylindrical shell-beads similar to the wampum of the Atlantic coast Indians were made to some extent by the Indians of the west coast. In the trading between whites and Indians, wampum so completely took the place of

ordinary coin that its value was fixed by legal enactment, three to a penny and five shillings a fathom. The fathom was the name for a count, and the number of shells varied according to the accepted standard of exchange. Thus where six wampum went to the penny, the fathom consisted of 360 beads; but where four made a penny, as under the Massachusetts standard of 1640, then the fathom counted 240. Wampum circulated in the remote districts of New England through the 17th century, and even into the beginning of the 18th. It was current with silver in Connecticut in 1704.

Wampum was also used for personal adornment, and belts were made by embroidering wampum upon strips of deerskin. These belts or scarves were symbols of authority and power and were surrendered on defeat in battle. Wampum also served a mnemonic use as a tribal history or record. "The belts that pass from one nation to another in all treaties, declarations and important transactions are very carefully preserved in the chiefs' cabins, and serve not only as a kind of record or history but as a public treasury. According to the Indian conception, these belts could tell by means of an interpreter the exact rule, provision or transaction talked into them at the time and of which they were the exclusive record. A strand of wampum, consisting of purple and white shell-beads or a belt woven with figures formed by beads of different colours, operated on the principle of associating a particular fact with a particular string or figure, thus giving a serial arrangement to the facts as well as fidelity to the memory. These strands and belts were the only visible records of the Iroquois, but they required the trained interpreters who could draw from their strings and figures the acts and intentions locked up in their remembrance" (Major Rogers, *Account of North America*, London, 1765).

Weeden, *Indian Money as a Factor in New England Civilization* (Baltimore, 1884); E. Ingersoll, "Wampum and its History," in *American Naturalist*, vol. xvii. (1883); Horatio Hale, "On the Origin and Nature of Wampum," in *American Naturalist*, vol. xviii. (1884); C. L. Norton, "The Last Wampum Coinage," in *American Magazine* for March, 1888; David Ives Bushnell, *The Origin of Wampum* (1906); New York State Museum, *Wampums of the Iroquois Confederacy*, 61st Ann. Rept. Pt. I (Albany, N.Y., 1907); Nehemiah Vreeland, "Wampum: The Native Substitute for Currency in North America," in *Numismatist*, vol. xxvii. (1914); Frank A. Speck, "The Penn Wampum Belts" (Leaflet of Mus. of Amer. Ind. No. 4, 1925).

WANA, a valley and frontier outpost of Waziristan in the North-West Frontier Province of India. It lies to the west of the Mahsud country, and to the north of the Gomal river, and is inhabited by the Waziri tribe. Lying on the border of Afghanistan, it is conveniently placed for dominating Waziristan on the north and the Gomal pass on the south, and occupies very much the same strategic position as the Zhob valley holds in Baluchistan. In 1894, when the Indo-Afghan boundary commission was delimiting the Waziri border, the Mahsud Waziris, thinking their independence to be threatened, made a night attack on the camp of the commission at Wana. The result was the Waziristan Expedition of the same year, and the occupation of Wana by British troops. On the formation of the North-West Frontier Province in 1901 it was decided to replace the troops by militia, and Wana was handed over to them in 1904. It was abandoned during the third Afghan War, and has not been re-occupied.

WANAMAKER, JOHN (1838–1922), American dry goods merchant, was born in Philadelphia (Pa.), on July 11, 1838. He attended a public school in that city until he was 14, when he became an errand boy for a book store. He was a retail clothing salesman from 1856 until 1861, when he established with Nathan Brown (who afterwards became his brother-in-law) the clothing house of Wanamaker and Brown, in Philadelphia, the partnership continuing until the death of Brown in 1868. In 1869 Wanamaker founded the house of John Wanamaker & Co. In 1875 he bought the Pennsylvania Railroad company's freight depot at 13th and Market streets, and in the following year opened it as a dry goods and clothing store. In Sept. 1896 he acquired the former New York store of A. T. Stewart, of which his partner, R. C. Ogden, had the management. This and the Philadelphia store are among the largest department stores in the United States. Wanamaker was postmaster-general in President Benjamin Harrison's cabinet in 1889–93, and brought about the establishment of post-offices on ocean-going vessels. He died in Philadelphia on Dec. 12, 1922. Wanamaker early identified himself with religious works in Philadelphia; was the first paid secretary, in 1857–61, of that city's Young Men's Christian Association, of which he was president in 1870–83, and in 1858 founded, and thereafter served as superintendent of, the Bethany (Presbyterian) Sunday school. He took an active part in the movement which resulted in the formation of the U.S. Christian commission in 1861.

WANDERU or **WANDEROO,** the name for langur monkeys (*Semnopithecus*) inhabiting the island of Ceylon; in India, commonly misapplied to the lion-tailed macaque, *Macacus silenus* (*see* LANGUR; PRIMATES).

WANDSWORTH, a south-western metropolitan borough of London, England. Population (1921) 328,307; area 9,107 acres. The name, which occurs in Domesday, indicates the position of the village on the river Wandle, a small tributary of the Thames. Wandsworth is the largest in area of the metropolitan boroughs, including the districts of Putney by the river, part of Clapham in the north-east, Streatham in the south-east, Balham and Upper and Lower Tooting in the centre and south. These are mainly residential districts, and the population has increased greatly during the present century with the tendency for more and more people to reside away from the city. The increase is also associated with the rise of industries, chiefly oil-mills, dyeworks, paperworks, calico-printing and hatmaking. Towards the west, along the Upper Richmond and Kingston roads, there is considerable open country. It is to a great extent preserved in the public grounds of Putney Heath, which adjoins Wimbledon Common, outside the borough, on the north; and Richmond Park and Barnes Common, parts of which are in the borough. Other public grounds are parts of Wandsworth Common (193 acres) and Clapham Common, both extending into Battersea, Tooting Bec (147 acres) and Streatham Common (66 acres), and Wandsworth Park bordering the Thames. The borough returns five members to Parliament.

WANGANUI, seaport and fifth town in New Zealand. Pop. (1927) 27,180. The town is laid out in rectangular blocks at the foot of low hills, from the summit of which a splendid panorama is seen, including the snow-clad Mount Ruapehu to the north-east. The river bar is from 21 ft. to 23 ft. deep at high water. The district is chiefly pastoral, and wool is exported, as well as meat and dairy produce, for which there are large refrigerating works. The Wanganui Collegiate School (Church of England) is one of the largest boarding schools in New Zealand. The district was the scene of conflicts with the natives in 1847, 1864 and 1868, and in the beautiful Moutoa gardens a monument commemorates the battle of that name (May 14, 1864). The settlement was founded in 1842.

WANGARA, the Hausa name for the Mandingo (*q.v.*), a people of West Africa; used also as the name of districts in the western and central Sudan. The Wangara are also known as Wangarawa, Wongara, Ungara, Wankoré and Wakore. According to Idrisi (writing in the 12th century), the Wangara country was renowned for the quantity and the quality of the gold which it produced. The country formed an island about 300 m. long by 150 in breadth, which the Nile (*i.e.*, Niger) surrounded on all sides and at all seasons. This description corresponds fairly accurately with the tract of country between the Niger and its tributary the Bani. Idrisi's account of the annual inundation of the land by the rising of the Niger agrees with the facts. He states that on the fall of the waters natives from all parts of the Sudan assembled to gather the gold which the subsiding waters left behind. The discoveries of Hornemann, Mungo Park and others revived stories of Wangara's richness in gold. Rennell and others (early XIX. cent.) shifted the Wangara country far to the east and confused Idrisi's description with accounts which probably referred to Lake Chad. The Wangara territory was again moved westward, and was located within the Niger bend, as knowledge increased. The name has now disappeared from maps

save that a town in the hinterland of Dahomey is named Wangara (French spelling Ouangara).

WANGARATTA, a town of Victoria, Australia, at the junction of the Ovens and King rivers, 145½ m. by rail N.E. of Melbourne. Pop. (1921) 3,689. It is in an agricultural district and is the see of an Anglican bishop.

WANSTEAD, an urban district in Essex, England, on a branch of the L.N.E.R. railway, 8 m. N.E. of Liverpool Street station. Pop. (1921) 15,298. Wanstead Park, 184 acres in extent, was opened in 1882. Northward extend the broken fragments of Epping Forest. Wanstead Flats, adjoining the Park, form another open ground. At Snaresbrook in the parish of Wanstead are the Infant Orphan Asylum, founded in 1827, and the Royal Merchant Seamen's Orphan Asylum, established in London in 1817 and re-founded here in 1861.

Wanstead in Saxon times was owned by the monks of St. Peter's, Westminster, and afterwards by the bishop of London. In the reign of Henry VIII. it came into the possession of the crown, and in 1549 it was bestowed by Edward VI. on Lord Rich, whose son sold it in 1577 to the earl of Leicester.

WANTAGE, a market town in Berkshire, England. Pop. (1921) 3,886. The church of St. Peter and St. Paul is Perpendicular and Early English. The grammar school preserves a Norman door from another church, which formerly stood in the same churchyard with St. Peter's. In the broad market-place is a great statue of King Alfred, executed by Count Gleichen and unveiled in 1877, for Wantage is famous as the birthplace of the king in 849.

WAPAKONETA, a city of western Ohio, U.S.A.. Pop. (1920) 5,295 (97% native white). It is in a rich grain-growing region, which has deposits of gas and oil. The city manufactures furniture, churns, acetylene gas generators, chains, wheels, steel wagons, refrigerators and various other articles.

WAPENSHAW (M.E. for "weapon-show"), a periodical muster or review of troops formerly held in every district in Scotland, the object having been to satisfy the military chiefs that the arms of their retainers were in good condition. Scott's *Old Mortality* gives a description of one. The name is still given to rifle meetings held annually in some parts of Scotland.

WAPENTAKE, anciently the principal administrative division of the counties of York, Lincoln, Leicester, Nottingham, Derby, and Rutland, corresponding to the hundred in the southern counties of England. In many cases, however, ancient wapentakes are now called hundreds. The word wapentake, of Scandinavian origin, originally signified the clash of arms by which the folk assembled in a local court expressed their assent to its decisions. Wapentakes are not found outside the parts of England which were settled by the Danes.

See H. M. Chadwick, *Studies on Anglo-Saxon Institutions* (1905); H. Ellis, *General Introduction to Domesday Book* (2 vols., 1883); Liebermann, *Gesetze,* ii. 729 (1912).

WAPITI, the name applied to several deer of the red-deer group. The true wapiti is *Cervus canadensis* of North America, where it is often called "elk." It is somewhat larger than the red deer, with big antlers characterized by the large fourth tine. Other species to which the name wapiti is applied are *C. eustephanus* from the Altai, the Manchurian *C. luchdorfi* and the Maral or Tian Shan wapiti, *C. songaricus.*

WAQIDI [Abū 'Abdallah Mahommed ibn 'Umar ul-Wāqidī] (747–823), Arabian historian, was born at Medina, where he became a corn-dealer but was compelled to flee from his creditors (owing largely to his generosity) to Baghdad. Here the Barmecide vizier Yahyā b. Khālid (*see* BARMECIDES) gave him means and made him cadi in the western district of the city. In 819 he was transferred to Rosafa (Rusāfa) on the east side. His greatest work is the *Kitāb ul-Maghāzi,* on Mahomet's campaigns.

The first third of the *Kitab ul-Maghāzi* (one leaf missing) was published by A. von Kremer from a Damascus ms. (Calcutta, 1856). Sprenger in his *Leben Muhammad's* used a British Museum ms. containing the first half, all but one leaf. J. Wellhausen published an abridged German translation from another British Museum ms. under the title *Muhammad in Medina* (Berlin, 1882).

Ascribed to Wāqidī, but probably written at the time of the Crusades to incite the Moslems against the Christians, are several further works on the conquests of Islam. *See* ARABIA, *Literature.*

(G. W. T.)

WAR. A war is a fight between human societies—in primitive conditions between savage tribes, in the civilised world between states. Its explanation involves the analysis of the terms of this definition and requires the aid of the sciences that treat of its several elements; of biology to account for the fight, of sociology to explain the State, and of the historical sciences to trace the evolution, in connection with that of the State, of armed forces and of the modes of their employment.

Fighting appears to be part of the order or disorder of nature. Life is the self-realising or self-asserting energy of a countless multitude of organisms, each of which approximates by growth to the type of its kind, reproduces that type and dies. The condition of growth is nutrition, the assimilation by the organism of extraneous matter. Reproduction multiplies every species. There is therefore a perpetual competition for the means of subsistence. Plants in any given area crowd each other out and organisms capable of movement feed either upon plants or upon one another. In this competition, through countless generations, is accomplished the evolution of constantly higher types, which survive in virtue of increased fitness for the environment.

The environment is always changing, by geological process, by the incessant accumulation of dead organisms, and by modifications of the species that survive, whose existence conditions each other's.

Every higher organism has its systems of nutrition and circulation, regulated by their own nervous system, as well as its limbs, working under the direction of the brain. It is usually equipped with organs of attack and of protection or of evasion. Of these the variety is endless; on the one hand teeth, tusks, paws, claws, electricity and even poison; on the other hand, shells, hides, scales and devices for camouflage. The attack aims at the vital organs, those of nutrition, circulation and direction; the blows struck are met by parry and counter-blow. The response to attack is sometimes counter-attack, sometimes flight or evasion. An injury to one of the limbs sufficient to paralyse it exposes the vital organs, which are then liable to damage that must be fatal. The survival of any given creature in conflict with another depends on its fighting power; that of a species partly on the evolution of organs of combat and partly on adaptability to the geographical environment, climate and land, sea or air. Gregarious animals rely on co-operation, on the swarm, the herd or the pack.

Man is not only gregarious but social. Everything that is distinctively human is the product of the common life. The special characteristic of man is thought, expressed in the spoken word, and in the work of the constructing hand. Among the oldest monuments of thought are the flint arrow head, the beginning of man's ascendancy in the animal world, and the pictures scratched on bone or stone, his earliest attempts to represent the environment. Speech conveys the thoughts common to the group, and is at once the medium of understanding between the members of the group and a barrier separating them from other groups speaking other languages. The armed man is master not only of the wild beast but of the unarmed man. The group of men who co-operate is stronger than the same number without the power of co-operation, which comes from direction, given by the leader's word of command, of which the name is order. These are the elements of man's self-realisation, which takes the form not merely of his adapting himself to his environment but of his effort to shape it to his own purposes.

All these elements are found in the most primitive societies, which when they have found a region where they can subsist without wandering about, seek safety by establishing themselves in a cave, in a lake-dwelling or a high place surrounded by a ring fence. Eventually the home becomes a walled town with a ruler and a body of armed men. This is the beginning of the State and of what is the same thing, civilisation.

A State is a society occupying a definite territory and obeying the direction of a government. Its purpose is first to provide that security which enables men to work for their living and then to render possible to its people, through law, order and co-

operation, that free exercise of their faculties that makes life worth living. The division and specialisation of labour produce capital, which gives scope for the development of men's mental and spiritual powers. Obedience to law becomes habitual and spontaneous. The arts and sciences flourish. Within the State grows up a variety of associations, industrial, commercial, intellectual and religious. The State asserts its supremacy over them all and admits no rival to the supreme authority of its government.

Growth means expansion. The orderly life of the State brings with it an increase of population, of wealth and of power and the multiplication of those wants which the community feels and endeavours to supply. Expansion means first of all more space. The growing State seeks to enlarge its boundary. If the land beyond its borders is unoccupied, all that is required is to take possession of it; but if it is the property of another State its occupation will be resisted and there will be war. Every State therefore has its organs for war, its armed forces.

In the anatomy of the State as of any other organism structure corresponds to function. The organs of nutrition and circulation, usually self-controlled, are the agricultural and commercial systems. The organs of perception and action, controlled by the organ of direction, the government, are the diplomatic service, the army and the navy, to which the twentieth century has added the air force. A full view of war will perhaps best be obtained by a consideration of the structure and working of the organs of action, beginning with the army as the oldest and best known, and tracing their evolution in connection with that of the State. The ground will thus be cleared for a retrospective and prospective view of the relation between war and civilisation.

THE ARMY AS AN ORGANISM

An army is a society within a society, an organism which, though it is a whole with a life of its own, is also a member of a larger and higher organism, the State whose life it shares. As a consequence of the development of the State it increases in size, in the complexity of its structure, and in the specialisation of its parts and their functions. The several elements of military strength depend each of them upon some factor in the national life. Superiority in any one of the elements is the outcome of national superiority in respect of the corresponding factor. This is usually due rather to mind and character than to physical causes.

The source of discipline is the common life. The recruit finds himself living in a society, the regiment, pervaded by an order which in course of time shapes his bearing and enters into his consciousness. Here he receives his lessons in skill at arms and in evolutions. To these in modern times is added an instruction which explains to him the purpose of all that he is required to do. The pleasure that everyone feels when the meaning of what he is doing first dawns upon him carries with it a regard for the person who has opened his eyes. In a modern army the officer is at once the teacher and the leader of his men. A body of troops in which the officers know their work and care for their men will not be lacking in discipline, which is the index of the character and quality of the officers. Very strong is the bond between those who have shared the hardships and dangers of a campaign. The cohesion is strongest in an army that its commander has led to victory. The spirit of such an army is raised to a higher power. But incompetence or negligence in the higher ranks produces mistrust in those below, and an army which has lost confidence meets defeat half way.

The sanction of discipline is military law, a draconic code, which in war exacts the penalty of death for disobedience, for cowardice and for lack of vigilance. The military code, like the criminal code in civil life, seldom needs to be put into execution. It forms a background, a last resort, and fulfils its purpose because all concerned know that it is there. The fact that every State maintains such a code is a proof that most men are well aware of the connection between the force of the State and the order of life which it secures. This consciousness is patriotism. Nothing else accounts for the acceptance by a representative assembly of a mutiny bill or an army act and by peaceful citizens of voluntary enlistment into a force governed by military law.

The numerical strength of an army depends on the size and wealth of the State and also upon the degree to which it is subject to the pressure of rivalry, for this determines the mode of recruiting.

When from the dark age of early Greece the city State emerges, we have the first glimpse of armies properly so called. Every citizen as soon as he is of age receives a soldier's training and for each campaign as many are called out as the need requires.

At first the citizens arm themselves at their own expense according to their means. As wealth increases the expense is borne by the State. In the early Roman constitution the citizens, all of them soldiers, are classified according to the equipment of which their means admit. The constant wars of the later Republic brought with them continuous service with pay, leading under the Empire to a standing army, to the enrolment of the populace, and finally of the men of various German tribes. The chaos of the dark ages was followed by the feudal system. In the absence of a currency the king's forces consisted of mounted warriors, to each of whom was given a holding of land sufficient to enable him to maintain his horses, armour, weapons and retainers. The army was a collection of fully-armed knights, with their squires and retainers of inferior equipment and fighting value. The feudal lord built himself a stronghold and the system tended to become the anarchy of a multitude of conflicting barons.

With the rise of towns the urban communities could afford to arm their citizens. The anarchic condition was scarcely modified by the perpetual conflict between the feudal lords, relying on their mounted men at arms and the cities beginning to trust their citizens fighting on foot. After the discipline of the Swiss infantry had enabled them to defeat the Burgundian cavalry, there came up again the system of mercenaries, which had been known to the Greeks, bodies of troops attached to a leader who hired himself and his force to any Power that would pay them. The beginning of the modern military system was the formation in France of a royal army serving the king for pay. Hence the name "soldier," that is "paid man." This model was everywhere copied. Side by side with it subsisted the principle, everywhere admitted as fundamental, that it is the citizen's duty in case of need to fight for his country. This was the basis of the militia system, by which an auxiliary army was raised by royal authority through local officials levying by ballot a quota of men mustered from time to time, occasionally trained and called out only in emergencies.

Revolutionary France at bay required every full-grown man to be a soldier but after a few years relaxed the application of the principle by admitting conscription with substitutes. After the collapse of Prussia Napoleon imposed upon her a limitation of the numbers of her army. She evaded this by dismissing every year those men whose training was thought to be completed and replacing them by fresh recruits. When, after the disastrous campaign in Russia, Prussia joined the coalition, she recalled to the colours all the trained men who had been sent home and thus put into the field a force far exceeding the limit prescribed by Napoleon. After 1815 Prussia made permanent the system of compulsory short service. Every young man at twenty became a soldier for three years and was then dismissed with the liability to be recalled in case of war at any time till the age of thirty-six. This system was afterwards copied by almost all the European States except Great Britain.

In 1791 the French Constituent Assembly decreed a levy of volunteers from the National Guard and the troops thus raised rendered good service in the campaign of 1792. In 1803 the assembly of the French army at Boulogne led in England to the raising of 300,000 volunteers and in 1859 the apprehension of a French invasion occasioned the formation of volunteer corps which became permanent and were in 1905 reconstituted as the territorial army.

A national State engaged in a war for an object which its people regard as vital will devote its whole resources to the conflict and will, if need be, improvise armies whose numbers will be limited only by those of its able-bodied male population. In the American Civil War the Federal Government, which at the outset had a regular army of less than 100,000 men, found itself at the

conclusion of the struggle disbanding an army of a million. In the World War, Great Britain, together with the other States of the Empire, put into the field some 7,000,000 soldiers.

The history of weapons belongs to that of invention and of the industrial arts. As these arts advance the weapons improve; where they are undeveloped the weapon will be inferior. The progress is competitive, for no nation can safely allow its soldiers to be supplied with weapons inferior to those of a possible adversary. The Stone Age produced the bow and the flint arrow head; the Bronze Age the spear, the sword, the shield and the helmet. The Iron Age added the Roman pilum, the javelin which bent when it struck, and steel brought with it the short Spanish sword.

In the fourteenth century the Swiss infantry fought with the halberd, a combination of spear and battle axe which developed into the pike. In the sixteenth century gunpowder, invented in the fourteenth century, began to make itself felt on the battlefield, perhaps one-third of the infantry having the arquebus, the rest being pike-men. In the sixteenth century too cannon began to play havoc with the masses of infantry. The arquebus gave place to the match-lock which at the end of the seventeenth century became the flint lock. With the invention of the bayonet pike-men disappeared and infantry were all alike armed with the flint-lock and bayonet. The eighteenth century produced no changes in weapons, though the field gun became lighter and more mobile and the siege gun more powerful. The nineteenth century produced the percussion-cap, the rifle, the breech-loader, the magazine rifle and the machine gun and also the breech-loading rifled cannon and smokeless powder. In the twentieth century, armour, which had disappeared before the bullet, has been revived in the shape of the steel helmet and of the tank, a bullet-proof armour-plated car carrying a quick-firing gun and driven by an internal combustion engine. The invention of this type of engine has also produced the aeroplane. The advance of chemistry has introduced many kinds of high explosives and has also brought poisonous gas on to the battlefield.

Good weapons have always been costly. The arms of Achilles were a great prize; a Damascus blade was not to be had for nothing; a modern heavy gun costs a fortune and one of its projectiles a mechanic's weekly wage. Thus the up-to-date equipment of an army has never been possible except to a wealthy community in which the mechanical arts were in the van of progress.

Soldiers must not only be armed but clothed. In primitive armies the soldier's dress was not different from that of the ordinary citizen. Uniform was first introduced in the seventeenth century by Louvois, and since then the State has to incur the considerable cost of clothing its army.

A commander directs his army as a single whole. His action may be compared with that of the fencer, who, having perfect control of his weapon, is always watching his opponent's eye. To facilitate his control the army is organised. Every small group of men forms a unit with its own leader and two or more such units are grouped into a larger unit, also with its own leader. The organisation varies from age to age. In recent times the units, in ascending order from small to great have been, in the infantry, the platoon, company, battalion and brigade, in the cavalry, the squadron, regiment and brigade; in the artillery the battery of four or more guns and the brigade. An infantry division has hitherto been composed of brigades of infantry and artillery, a squadron or regiment of cavalry together with engineers, ambulances and the transport belonging to all these units. It is a miniature army complete in itself. Divisions are grouped into army-corps and these into armies according to the size of the whole army and the convenience of command.

No army, during peace, can be kept quite ready for war. The Romans began a war by raising a number of legions. In modern armies the number of men with their regiments during peace is only a fraction of those that have been trained as soldiers and who will be required in case of war. Accordingly, when war is imminent, the reservists are ordered to join their regiments at their respective peace stations, where they are supplied with uniforms, arms and equipment. Every branch of the army is brought up to full strength and supplied with ammunition, transport and all the requisites of a campaign. This proceeding, the business of putting the army on to a war footing, is called mobilisation. The arrangements for it are planned and prepared in every detail in advance in order that no time may be lost in their execution.

The governing principle of war is "whatsoever thy hand findeth to do, do it with thy might." A State therefore, whether its policy be aggressive or conservative, does well on going to war to put into the field at the start as large an army as possible. Yet no error is more frequent than beginning a campaign with a portion of the forces available and keeping back the other portion. This is apt to lead to the defeat of each portion in turn. In 1859 Austria opposed the French and Sardinian armies with half her army and, after this half had been defeated at Magenta, the second half was brought up to be defeated at Solferino. In 1870, after the bulk of the French regular army had been compelled to surrender at Sedan and at Metz, France was able to raise fresh armies of considerable strength. It would have been wiser to avoid battle, if necessary by retreat, until the ranks of the original regular army had been swollen by the addition of every available man.

In order to be able to fight a battle an army must be assembled. It must be able to move from place to place and must at all times be kept supplied with food and with munitions of war. Its fighting power depends on the conditions of its assembly, of its marching, resting and supply.

The assembling of an army was until recent times a comparatively simple matter. A Roman army encamped in an area of which the sides measured a few hundred yards and protected itself by a rampart and a ditch. Even an early eighteenth century army could be assembled in an area every part of which would be within its commander's view. A modern army is usually as far as possible lodged in houses, for the transport of tents makes a serious addition to the baggage train and long experience proves that to bivouac in the open quickly adds to the sick list. But if the men are to be housed they must be spread over an area large enough to accommodate them in its towns or villages. An army of 36,000 men in a fairly populated European country can be billeted in an area of some sixteen square miles. An army of 100,000 men will occupy an area of thirty square miles. These numbers were perhaps never exceeded until the close of the eighteenth century. In 1805 Napoleon entered Germany with 200,000 men, a force which could hardly be billeted in an area less than 45 square miles. In the World War armies, numbered by millions, spread themselves across the country over a belt hundreds of miles long and twenty or thirty miles broad.

TRANSPORT AND COMMISSARIAT

The movement of a modern army is a complicated business. A British division in 1914 was composed of 18,000 men, 5,000 horses and 900 vehicles of various kinds. It could be packed for bivouac into half a square mile, but marching along a road it would form a column fifteen miles long, suppose it to march by road from one bivouac to another distant twelve and a half miles —that is about the length of a normal day's march. The normal pace of marching is 3 miles an hour, but it is the practice during every hour to halt for ten minutes, so that the average rate of progress of the column is 2½ miles an hour. If the first man starts at 6 A.M. he will reach the new camp at 11. As the column is 15 miles long the last man or the last vehicle cannot leave the original bivouac till noon and cannot reach the new camp till 5 P.M. If a second division had to follow on the same road its last cart could not reach the new camp before 10 A.M. the next morning. Accordingly whenever possible each division is given a road to itself. An army of four divisions, 100,000 men, marching along a single road would form a column sixty miles long and the rear division would be three or four marches behind the front. For the purpose of joining in the same battle the four divisions would be nearer to each other if marching on four parallel roads three or four miles apart than if following one another in one and the same road. Thus the modern principle is

hat an army must be spread out for marching and for billeting but always so that it can be concentrated for battle.

For a modern army good roads have hitherto been a necessity; hey have been supplemented by railways and by track vehicles apable of going across country. The Roman roads were made or the Roman armies and formed a very important factor in he extension of Roman power and the spread of Roman civilisa- ion. After the collapse of the Roman Empire good roads dis- ppeared from Europe for some twelve centuries. Macadamised oads were introduced in the second half of the eighteenth cen- ury and quickly spread their network over western Europe. It as in part to their existence that was due the great rapidity of Napoleon's marches compared with those of his predecessors. The roadmaker is necessarily also a bridgemaker and a surveyor. The accurate surveys of all the great States of Europe, as well s the maps based upon them, have in every case been produced y a department of the army, in the first instance for military nds.

Railways were first used for the transport of troops in 1859, nd during the nineteenth century their employment for this pur- ose was confined to the movement of armies from their home uarters, where they were mobilised, to the places of assembly on he frontier. A single train may carry perhaps a thousand men; division, for its infantry, horse and guns, would need from wenty to thirty trains, which if they required half an hour each o load and unload would make the total time 30 hours exclusive f the time occupied on the journey. Rail transport, therefore, esults in no saving of time when the distance is not more than a ouple of days' march; the modern development of railways, how- ver, is so great that for long distances it is very much quicker han marching. During the last war very large bodies of troops ere constantly moved by rail from one part of the theatre of ar to another.

The difficulty of feeding an army can best be illustrated by a imple comparison. One of the groups of army corps into which modern army is sub-divided will have a strength of perhaps 00,000 men, equal to the population of a good-sized town. The own is permanent and stationary. But no one except its com- ander knows where the army will be to-morrow or next week. et it cannot be allowed to starve even for a day. In the Middle ges and long afterwards armies supplemented what they could arry with them by plundering, and this was possible when the rmies were small and the population supported itself mainly by s own crops. With the rise of regular armies and of the modern tate, armies were fed from magazines. Great depots of corn ere collected at fortresses on the frontier where mills were set o work to grind a part of it, and bakeries to produce biscuit. he soldiers were supplied with a five-days' ration which each an carried for himself. Sacks of corn were loaded on wagons r mules and moved to a point five-days' distance from the for- ess. Here mills and ovens were prepared and biscuits baked to ive the men another five-days' supply. Cattle were driven with he army and slaughtered as required. Plunder was forbidden. ew depots were created at intervals of a few days' march as the rmy advanced. But this took time. The system imposed limi- ations on the commander, for the army could not be moved to a istance of more than ten days' march from its magazines.

The French revolutionary armies had not the resources re- uired for the creation of magazines. In the enemy's country, herefore, they lived by plunder. Napoleon made an extensive se of magazines, which, however, he supplemented by a well rganized system of plunder, christened by the revolutionary name Requisition."

In the nineteenth century the Prussian army, imitating Na- oleon, combined the system of magazines with requisition. he British army has always used the system of magazines, sup- lemented by such resources as could be obtained in the enemy's ountry, not by plunder, but by purchase. In our own time the upply of armies has been greatly facilitated by the adoption of otor transport, which goes far to relieve or even to supersede he railways which in the nineteenth century were the principal eans for the transport of supply.

WEAPONS AND FORMATIONS

All the troops of an army must be trained in the use of their weapons and in those evolutions required for effective action and for the co-operation of the various units large and small. Formations and evolutions are handed on by tradition and in modern armies regulated by official text-books. They must be suited to the weapons employed and are therefore perpetually modified to keep pace with the progressive improvement of weapons.

Among weapons the important distinction is between those which are held in the hand for cutting and thrusting, of which the types are the sword, the spear and the bayonet, and those which are thrown from a distance by hand or by machine, the arrow and the javelin, the stone and the bullet, the grenade and the shell.

The history of formations and evolutions is that of a continual argument carried on in the recurring trials of the battlefield between the hand weapon and the missile, between mass and elasticity of evolution, between the arm and the head. It is the story of the unwieldy phalanx against the nimble maniples, of the Roman legionaries hurling their javelins into the mass of spearmen and rushing with their short swords into a crowd in which no man had room to wield his spear. It is the story of the legion helpless against the swarm of mounted Parthian bowmen, of the long-bow against the man at arms, the bullet against the bayonet.

In the 18th century came the dispute of the heavy column against the flexible column and the line, argued first on paper between Folard and Guibert. "It is an illusion and a prejudice" said Guibert "that the force of a body of troops is increased by augmenting the depth of its formation." It came to trial at the end of the 18th century between French skirmishers and the Prussian line and later in the Peninsula and at Waterloo between the British two-deep line and the French column. The introduction of the first breech-loader, the needle gun, established the supremacy of the bullet. But the tradition of "cold steel" and of the mass died hard. In 1866 the Austrians rushed against the needle gun and were shot down. At Gravelotte swarms of Prussians, eager to charge, were slaughtered by the bullets of the Chassepot. Faith in the bullet had not yet overcome the superstition of the bayonet; in South Africa it happened too often that a body of British troops surrounded by a ring of invisible Boers found their only escape from the bullet in surrender. Yet this experience did not prevent British troops a dozen years later from being sent into fields of barbed wire to be massacred by the bullets of the machine gun and magazine rifle. The bullet and the shell have made an end of all fighting formations except thin lines or small clusters of skirmishers. Only out of range are the old formations of column and of line still possible. They are now merely formations of assembly or modes of moving troops.

The history of cavalry, apart from that of reconnaissance, leads up to the charge at full speed of a line of horsemen riding knee to knee. This was in the 18th and 19th centuries the ideal of cavalry trainers, who dreamed of the shock of the charge. But it is doubtful whether the shock has ever been realised in action, for in practice the opposing ranks pass through one another and instead of the smashing collision comes the mêlée. Against modern fire-arms the cavalry charge is hopeless, and the rôle of the horseman is restricted to reconnaissance, supplementary to that which is effected in the air, to the pursuit of demoralised troops and to the rapid seizure of points to be held by firearms.

The training of an army in peace consists in practice of the evolutions which are thought to be suitable for war. These as a rule embody the experience of the last war. Repetition makes them habitual; they become stereotyped. The habits of any society are difficult to change, and the professional soldier of all ranks becomes so accustomed to traditional forms and modes of action that he is apt to lose his receptivity to new ideas. The workings of an army thus tend to run in grooves and usually after a long period of peace a regular army begins a war by repeating the methods which tradition has retained from wars long past. This may lead to painful surprises if those who have had charge of the opposing army have meantime adopted improved weapons and modes of operation.

The Greek name for the art of the commander was strategy, of which the object was defined as victory. The Greek name for arranging an army in order of battle was tactics. These terms are still used, with the distinction that tactics is defined as the art of fighting battles and strategy as the art of so directing all the operations of the army as to lead to a decisive victory, that is, to the destruction, in a military sense, of the enemy's forces. The terms are convenient in theoretical analysis. But in practice the two forms of activity are inseparably intermingled.

TACTICS

It is convenient to consider first the sphere of tactics—battle. The dominant factor of battle is the controlling mind and will of the commander. The process of battle always consists in killing and wounding, but these are not an end in themselves, except in so far as they diminish the enemy's numbers. The commander's object is to outwit his antagonist and to demoralise the opposing army, to produce in it disorder and confusion, and so to transform it from an organised body into a disorderly crowd. It is then at his mercy, and he can either disperse it by pursuit, compel its surrender on the spot, or cut down the survivors where they stand. A commander therefore tries to detect in the enemy's order some point where an effective blow will dislocate its system or structure. To that point he will direct his chief blow, for which he will prepare by attempts to mislead the enemy as to the intended direction of the decisive stroke. This is what gives its importance to surprise. A sudden blow delivered from a direction in which it was not anticipated may upset his opponent's plan and throw his army out of joint. In that case the opponent must retreat, if he can, before his army suffers further damage. But he may have anticipated the blow and have arranged a counter-stroke which may take the assailant by surprise, so that the tables will be turned.

The weak points of an army are its flanks and rear; and battles have seldom been won except by a turning movement leading to the attack or envelopment of a flank and a threat or attack against the rear.

At Rossbach and at Leuthen Frederick made use of his rapidity of evolution to strike the enemy in flank. Napoleon's favourite manoeuvre was, while engaging the enemy in front, to bring a body of troops from a distance against one of his flanks, causing him to weaken his front by moving troops to reinforce that flank. Napoleon then with his reserve attacked and pierced the weakened front. This was the plan of Castiglione and of Bautzen. It was the plan that miscarried at Ligny owing to the non-arrival of D'Erlon.

An army is prepared to be attacked on its front and such attacks have rarely succeeded except when it has been possible for one army to make such a breach in the enemy's front as to create two flanks, from which the separated parts can be rolled up.

At Blenheim the French and their allies held a strong position of which the right flank was protected by the Danube, the left by forest-clad hills. While Prince Eugene engaged their left Marlborough first attacked their fortified right and then broke through their centre with his cavalry.

A good commander uses the several arms in close co-operation. During all the centuries before firearms had developed their power cavalry was usually the decisive weapon even where its numbers were comparatively small. A good general so manoeuvred both his infantry and his cavalry that they played into one another's hands. These were the tactics of Alexander and Hannibal, of Caesar and of Cromwell.

At Marston Moor, while the Royalist foot was getting the better of the Parliamentary foot, Cromwell with his Ironsides defeated in turn the Royalist horse of the right wing and of the left, and then crashed into the Royalist foot, thus saving his own side's foot and deciding the battle.

Very effective is the mode by which, while one army engages the enemy in front, a second army is brought up to attack him in flank. This was the method of the allies at Waterloo, repeated by Moltke at Königgrätz.

A body of troops expecting to be attacked occupies a position in which it can have the advantage of the protection afforded by the ground. Troops posted along the top of a slope with open ground in front of them can stand still to shoot at the enemy as he comes up, while he has the effort of moving.

A flank attack must be met facing it, that is by forming a new front to meet it. In the days of hand to hand fighting and of mass formations the men of the ranks behind the front on the wing attacked had to turn to their right or left. At Cannae Hannibal's foot attacked both flanks of the Roman massed legions and, as the Romans on both flanks had to turn to defend themselves, the front ranks could not continue their onset on Hannibal's front without leaving gaps between themselves and the flank men behind them. When Hannibal then brought up his horse to attack the Roman rear the Roman mass, surrounded, could not charge in any direction without leaving gaps. The Roman army, thus confused and paralysed, was cut to pieces.

With the advent of the flint-lock and bayonet a line of infantry with a clear space in front of it could keep off double its number advancing against it over the open. As firearms improved, the power of such a line increased, while the number of ranks diminished from three to two and then, with the breech-loader, to a single rank and with the magazine rifle to a row of skirmishers with intervals between them. The increase of the range of the bullet exposes the assailant during a much longer period to the enemy's fire; and since the introduction of the machine gun and the automatic rifle a frontal attack by infantry upon infantry is impracticable, unless the infantry has been decimated and shaken by shells or poisonous gas or by both.

Accordingly the assailant uses his superior numbers to spread out his force and envelop the enemy's flank or flanks. The opponent must then bend back the ends of his line so that the two opposing lines become parallel curves of which the one envelops the other and this may be continued until they become concentric circles.

An army enclosed is lost, for its only escape is to break through the enclosing circle. This means, wherever it is attempted, a frontal attack against a position without flanks during which the assailant has both flanks exposed. This is the explanation of the frequent surrenders in South Africa of British troops when surrounded by a ring of Boer skirmishers, who being mounted could always surround the British infantry. It is the explanation of Macmahon's surrender at Sedan.

Strength against attack is increased by fortification, of which the simplest form is a bank, with a trench or ditch before it, so placed as to command the ground in front for a space corresponding to the range of the weapons used. The advantage is increased with the range of the weapons employed and if the open space is strewn with obstacles to delay the advance of the assailant. With the aid of the engineer it has always been possible to make a well chosen position impregnable by direct attack on its front.

But it has also always been possible for a skilful assailant to turn to his own use the advantage thus conferred. The classical instance is the siege of Alesia. Vercingetorix occupied a hill which he turned into a fortress. Caesar surrounded it with a circle of fortifications which the Gauls found it impossible to break through. Caesar then surrounded his own army with fortifications looking outwards which the great relieving army of Gauls attacked in vain. The modern parallel to this is the capture of Bazaine's army at Metz.

The elements of fortification are always the same, the chosen position, the rampart, the obstacle and the projectile. The early city surrounded its hill with a stone wall from which the citizens shot their arrows, threw their javelins and hurled stones with catapults. The assailants attacked the wall with rams and mines, and built for their archers and slingers towers which the besieged would if possible set on fire. The mediaeval castle surrounded its wall with a moat and built a keep as a last resort. The wall became a square or oblong having, outside its corners, towers from which anyone approaching the wall could be shot down.

In due time the gun made an end of the stone wall, which was replaced by an earth bank with a parapet to shelter the guns and the musket men. The moat became a deep wide ditch: the square

or oblong became a straight-sided polygon, with bastions at the corners to enfilade the straight sides or curtains. These elements were developed in the elaborate systems of Vauban and Coehorn, of Brialmont and of the modern forts of concrete and steel plates. The history of fortification is a part of the long rivalry between the projectile and the shield. In the World War the projectile, the high explosive shell fired up into the air so as to drop on to the rampart, proved too much even for walls of concrete and steel, so that the rampart is now no more than a trench and the obstacle a field of barbed wire.

The purpose of fortification is to gain time by economising men. It enables a small number to resist a greatly superior force for a time which is always limited. In battle it enables the commander to resist attack with a part of his force while keeping the rest in reserve to be used for counter-attack either in another part of the field or at a later hour. The attack on a fortress begins by investment. The assailant surrounds it with a ring of fortified positions. It can then hold out only until its supplies of food and ammunition are exhausted, when it must needs surrender.

If the assailant wishes to shorten the time he must bring up enough powerful guns to destroy a portion of the rampart and must then send troops to attack at the place where a breach has been made. The investment and siege of a fortress require troops many times more numerous than those besieged. It thus takes away from an invading army far more troops than it withdraws from the army resisting invasion, to which therefore it is a source of strength. But it serves this purpose only if attacked, seeing that the garrison of a fortress that no one attacks is withdrawn to no purpose from the army to which it belongs.

THE STRATEGICAL ASPECT

We can now consider the strategical aspect of the conflict between armies.

The decisive act of war being battle and a commander's aim victory, his plan will be to bring on a battle as soon as he can with the chances in his favour, yet to put it off as long as he can if the chances are against him. The issue of a battle is always uncertain. An order may be miscarried or misunderstood and accidents may delay or prevent the arrival of troops upon which the commander counts. His opponent may have some new and unforeseen weapons or devices. He himself may be mistaken or misinformed about the enemy's numbers, positions and movements. He can know very little of what is going on behind the enemy's outposts. He is always dealing with a more or less known quantity, his own army, and a more or less unknown quantity, the enemy. He has to make up his mind and to act upon data of which few are certain. That is why no man can be a great commander without special qualities of character. The essential is not cleverness but a certain greatness of soul. A commander can always obtain advice, but it requires a very strong and high character to take the responsibility involved in acting on another man's judgment.

What then are the elements upon which the chances depend, the means by which a commander can load the strategical dice in his own favour? The first is to have more troops on the spot; the second to make the enemy uneasy by threatening to stop his supplies or to block his way home. It is assumed of course that the armament and training of the troops are much the same on both sides, for strategy can hardly compensate for tactical inferiority. Numerical superiority is not secured merely by the State's possessing the larger army, because in a battle the only troops that count are those that take part in it. When the consul Nero, leaving part of his army to watch Hannibal's, marched off with the rest of it to reinforce the general who was dealing with Hasdrubal and so destroyed Hasdrubal's army, he gave a lesson which has too often been forgotten. If an army can place itself between two parts of an enemy army separated from one another by several days' march, its commander can repeat Nero's manoeuvre, though if he allows them to approach too near, say within a day's march of one another, he may be attacked by both at once. One of Napoleon's favourite plans was this "manoeuvre from a central position," which succeeded so brilliantly in 1796 but failed in 1815, as it did in 1866 at Königgrätz.

The first principle, then, is to keep the army together.

The commander whose army is ready and who feels assured of its superiority wishes to bring on his battle as soon as he can. A march towards the enemy's capital is pretty sure to bring the enemy's army into the field, especially if the capital is not only the centre of the national administration but also an industrial and commercial city.

His opponent, of less strength, will wish to avoid battle. If he can find a position strong enough to make up for his inferiority he may stand and fight there. Otherwise he will wish to put off the battle till he can be reinforced either by fresh levies or by an ally, or until his antagonist has been weakened by the fatigues of campaigning and by detachments made to protect an ever lengthening line of communications. His object then is to waste the assailant's time and to gain time for himself.

For many centuries it was exceedingly difficult to force an opponent to fight a battle against his will. When battles were fought at close quarters with the sword, the spear, or the pike, infantry were formed in dense masses many ranks deep. Only with such a mass, the spear points of several ranks projecting beyond the front, was it possible to resist a cavalry charge. A fight begun could hardly be broken off, for, once the troops were engaged hand to hand, those who turned their backs on the enemy were lost. A small force could hardly engage a large one without the risk of destruction. Accordingly an army was kept together in a single mass. Until the order of battle was completed it was not safe to approach the enemy. But a very long time was required for changing the order from that of the march to that of the fight. If therefore a commander, on seeing the enemy approach, thought it prudent to avoid battle, he could march away while his opponent was forming for action. Nothing was more difficult than to force a battle upon an unwilling enemy. After Hannibal had destroyed three Roman armies the Roman commander Fabius adopted the plan of wearing him out without risking battle, and Hannibal spent twelve years marching up and down Italy without finding a favourable opportunity for a successful attack upon the Roman army.

These conditions remained unchanged until the eighteenth century. When, after the introduction of the flint-lock, the bullet began to exert its power, it was found that infantry in a line of four or even of three ranks could withstand a cavalry charge. Then came systematic drill, by which a body of troops was trained to move simultaneously like a machine at the word of command. A number of platoons marching one behind another at a distance equal to the frontage of a platoon could form line in a few seconds by the wheel of each platoon to the right or left. The French army copied, improved and simplified the Prussian drill and cultivated side by side with it the practice of skirmishing, that is, of putting before their formed bodies a row of sharpshooters to harass the enemy. It then became possible to break off an engagement by the alternate retreat of portions of the line, one set holding back the enemy by its fire while the other set withdrew to reform farther back and repeat the operation. A small body could break off an engagement by fighting in retreat and a rear guard could delay an army. It became possible to sub-divide an army, provided that its several parts were near enough to be re-united for battle. Accordingly the French army was organised in permanent divisions of all arms. Napoleon would advance with a number of divisions or of army corps marching on parallel roads, so that his army would be spread across an area perhaps a hundred miles wide, overlapping the enemy's front. Then by a concentric movement towards a point in the enemy's rear, he would envelop him so that he must either fight or beat a hasty retreat. This practice, the alternate expansion and contraction of a large army sub-divided into independent units—divisions or army corps—was also that of Moltke. A twentieth century army has numbers so vast as to be able to form a continuous front along a whole frontier. Battle can no longer be evaded and can be postponed only by retreat.

The attack or threat of attack on the line of communication is comparatively modern. As long as armies were small and com-

pact, living on the country in which they found themselves, they required no communications and could retreat in any direction. But with the growth of armies and the rise of the magazine system the line of communication became vital. It must be protected at any cost. If therefore a commander found the enemy moving in a direction which, if prolonged, would sever his communications, he must immediately change front to resist the threatened attack. If he should then be beaten he would be driven across and away from his line of communication. If the attack were aimed at a point lying some distance to his rear he must turn back and fight facing the way home. In either case his position if he should be beaten would be desperate. But he who attacks the enemy's communication must be careful in so doing not to expose his own. This form of operation, the attack on the communications, became important in the eighteenth century and increasingly so as a consequence of the spread of metalled roads over western Europe. It was constantly adopted by Napoleon; and in the modern theory of strategy, which is based mainly upon the analysis of his campaigns, takes a prominent place.

An army is always much disturbed by finding its communications threatened or severed or its way home occupied by the enemy. Napoleon counted on the consternation which the sudden appearance of his army on the flank or rear of the enemy was sure to produce.

In the nineteenth century the source from which an army drew its supplies was no longer a frontier fortress, as it had been in the eighteenth century, but the whole country from which it started. The line of communication was formed by the network of railways behind the army. In the World War when an army was spread across a whole country in a continuous line, its communications could be reached only by breaking and piercing its front.

Whatever advantages a commander's strategy has procured him for the battle he has planned, will be thrown away unless he wins the battle, and his opponent by victory will wipe out all his own mistakes. No strategy will compensate for tactical inferiority.

NAVAL WARFARE

A navy owes its special character to the nature of the sea. All warfare at sea is governed by the law of gravitation. The weight of every floating body is exactly equal to that of the quantity of water which its immersed part displaces. Ships of equal displacement are of equal weight. The necessary elements of every ship are the hull, the means of propulsion, the crew and their food and water. These therefore represent a constant amount of the ship's total weight. The remainder can be devoted to the purposes for which the vessel is intended. In a merchant ship it is available for cargo but if the ship is intended to fight it can be devoted to soldiers, their weapons, their food and water. These conditions are permanent and unchangeable; they apply equally to the galley, the sailing ship, the steamer and the oil-propelled ship.

Thus there has always been a distinction between the ship of war and the merchantman, consisting partly in the greater strength of structure of the warship and partly in its carrying in addition to its crew, and instead of a cargo, a large number of armed men and their food, water and ammunition. Accordingly at all times the merchant ship has been the easy prey of the warship.

The aim of either side in a sea fight is to destroy or capture the enemy's fleet. In the infancy of navies the fighting men were soldiers and the method was to grapple the enemy's ship so as to enable the soldiers to take it by boarding. The alternative was to try to sink the enemy's ship by ramming or to set it on fire. With the advent of the gun the effort to destroy the ship by shot and shell became more and more predominant. The sailor replaced the soldier as the fighting man at sea; the soldier on board a ship became the marine, whose original function was to maintain discipline in the crew.

Suppose a war between two States in which one possesses a fleet of fighting ships and the other does not. The fighting fleet cannot be resisted and will use its ships to chase and capture the enemy's merchant ships. The sea-borne trade of the State without a navy will shrink and disappear. Moreover the navy will be able to escort an army embarked on merchant ships to be landed on the enemy's shore.

If at the beginning of a war each of the belligerents has a navy the aim of each of the two commanders will be to destroy or capture all the enemy's warships. The commander, having this aim, will set out to find the enemy's fleet, which, if the opposing commander has the same aim, will lead to a battle. Suppose the Blue Admiral to have sixteen ships and the Red fourteen, that in the fighting three Blue ships and four Red ones are sunk and one Red one disabled, and that one Red ship is compelled to surrender by an appalling loss of men. Red now has only eight ships left against Blue's thirteen which will become fourteen as soon as a Blue crew has been put on board the captured vessel.

The Red commander has now no prospect of success and to continue the conflict will probably mean the destruction or capture of his remaining ships. He must therefore escape, if he can, to save the rest of his ships; but the Blue fleet will follow him. His only hope of safety is the land and the protection of an army. He therefore makes for a fortified harbour where he will be secure from attack. The Blue commander is baulked of his prey, for forts are stronger than ships. Blue will cruise near the exit from the harbour with ten or a dozen ships ready to attack Red if he should come out, while his remaining ships will capture any Red merchantmen they can find or may escort a Blue army transported in merchant ships to land on the enemy's shore and attack the fortress which protects the Red navy. So long as Red remains in harbour so much of the Blue navy as is not required to watch Red will be used to destroy Red's sea trade. But Blue's supremacy at sea will be precarious so long as it is necessary for him to lie in wait for the Red fleet, which after all may come out and risk a battle, either with his inferior force or, after a sufficient time, with that force strengthened by the addition of new ships.

The open sea has no inequalities. Rough or smooth its surface is the same for both sides, it offers no shelter of which the weaker force can take advantage. The commander of a fleet cannot protect himself by advance or flank guards, for a ship or a squadron once engaged with a much superior force can hardly fight without being destroyed and can avoid fighting only by retreat while still out of reach of the enemy's weapons. Accordingly the security of a fleet against surprise consists in the detachment of swift ships capable not of engaging battleships but of observation and evasion. At sea, as on land, the first principle is to concentrate for battle all the forces that can possibly be made available. An army or a fleet is concentrated for battle if its various parts are so near together that the enemy cannot interpose between them or destroy one portion in isolation. If the divisions of an army can in a day's march be assembled at any point they are ready for anything that can be done by an enemy two marches distant. The squadrons of a fleet cannot safely be so dispersed as to imperil their co-operation in battle. The speed with which fleets approach one another is so great and the speed of the swiftest cruiser so slightly in excess of that of the capital ships of the fleet as to impose very narrow limits upon the separation between squadrons that are to co-operate in battle. The conception of a battle cruiser appears to be inconsistent with the fundamental conditions of warfare at sea.

A fleet moves many times as fast as an army. Accordingly in the absence of an enemy fleet an army can usually be transported very much faster than an army can be moved by land to oppose its landing, and it is hard to recall an attempt to land an army that has been frustrated except at sea.

Ships take a long time to build, which is increased by every improvement in their construction. Nor can sailors be improvised. The land lubber cannot be transformed into a sailor in the few weeks or months which suffice to enable a plough boy to take his place in the ranks of an army. It is therefore exceedingly difficult for a modern State to replace during the war a navy that has once been seriously crippled.

From the sixteenth century onwards the gun has been the decisive weapon in naval warfare. The nineteenth century produced the steamship, which came to be built of iron instead of wood and requires from time to time the renewal of its stock of fuel, so that a modern fleet must have access to harbours containing

stores of coal or of oil. The improvement of the gun caused the capital ship to be armoured. Neither the ram nor the torpedo has proved able to rival the gun. In the World War the submarine, using the automobile torpedo, seemed at first to be a grave menace to the battleship, and for some time its ravages among enemy merchant ships were appalling. But means were found of attacking it, and the destroyer armed with quick firing guns and depth charges proved more than its match. As soon as merchant ships were grouped into convoys and escorted the rôle of the submarine lost much of its importance. But if the type should be further developed and produced in large numbers it might in future again play a great part.

BELLIGERENTS AND NEUTRALS

Much importance in maritime war attaches to the relation between belligerents and neutrals. A neutral State ceases to be neutral if it assists either belligerent to carry on the war. A neutral, therefore, is not permitted to supply either belligerent with anything that will assist him to carry on the war. In the 18th century the "law of nations" in regard to maritime warfare allowed the capture of enemy ships and of enemy goods in neutral ships, and also the right of search of every ship in order to ascertain the quality as enemy or neutral of the ship and its cargo. The search of their ships and the right of taking from them enemy goods and contraband of war was always disagreeable to the neutral States and they used to propose that enemy goods in a neutral ship should not be liable to capture. In 1856 the British Government consented to the Declaration of Paris, which laid down that enemy goods in a neutral ship should be exempt from capture unless they were contraband. The principle thus adopted is hardly consistent with the nature of maritime war. Some writers have constantly advocated the prohibition of the capture of private property at sea, under the impression that it would render warfare more humane. But in reality there is no such thing in war as private property at sea, for every ship and cargo is fully insured and the premiums are paid out of higher charges for freight and higher prices for goods, so that the loss incurred by the capture of a ship and its cargo is borne not by the owners but by the general community of the nation. Moreover the capture of merchant ships and their cargoes was regulated by stringent rules. The ship was taken by its captors to port where a court of law decided whether or not it was lawful prize. If the Court decided that it had been wrongly taken the enemy owners received compensation. Crew and passengers were in all cases protected from injury. The only effect of the prohibition of the capture of private property at sea would be to cripple the power of the maritime State, which would be unable to make use of naval victories to bring to bear upon its adversary the form of pressure involved in closing the sea to his activities.

The invention of the dirigible airship by Count Zeppelin and of the aeroplane by the brothers Wright has brought into warfare a new element. In the World War airships and aeroplanes were employed in conjunction with the army and with the navy. Their power in reconnaissance was so great as to compel the troops to adopt means of evading it, marching by night and camouflage. Airships were also employed in the bombardment of fortresses, harbours, communications and towns for the purpose of weakening the enemy's resources and of breaking down the resolution of his population to continue the struggle. This was undertaken first by the airship and afterwards by the aeroplane, which had very soon proved its superiority over the airship. The results obtained, by way of damage to workshops for the production of warlike *matériel* and by way of intimidation of the population, were far from decisive. But the exponents of aerial warfare expect that in the next war air forces will be employed in the attempt to paralyse an enemy State, by direct attack on industrial centres, on communications and on the seat of government, so as to produce consternation among the people. Not only high explosive bombs but also bombs to spread poison gas are counted upon for this purpose.

The analogy of warfare by land and sea suggests that the air forces devoted to these purposes should be attacked by the air forces of the State assailed, and that the preliminary to direct attack on towns and workshops would be victory in an air battle. But to this it is replied that the great speed of aircraft and the difficulty of finding an enemy moving through space in three dimensions make it impracticable to compel the enemy to fight; that the facilities of evasion are too great.

The conception of a war beginning by a sudden great air-raid which is to devastate the enemy's manufacturing resources and, by destruction and massacre, to paralyse a whole nation carries with it the suppression of the distinction between combatants and non-combatants and implies the preparation during peace of the whole nation as a fighting organism. From this the only escape seems to be the development of means of attack upon the raiding air forces.

The primary use of all armed forces, whether at sea, on land or in the air, is to destroy by fighting the armed forces of the enemy, that is to render them incapable of taking further part in the conflict. They are also used for the purpose of weakening the enemy by depriving him of some of his resources. This is accomplished by the occupation of his territory so that he can draw from it neither men nor supplies of any kind, and by the destruction of his sea-borne trade, which will cripple him in proportion to his dependence upon it. Air forces are also to be employed for this purpose. But it is not economical to use for these secondary purposes forces which could be employed against the enemy's armed forces, for when those have been destroyed the enemy is in any case helpless. The destruction of the enemy's navy will not usually suffice to bring him to terms; it must be supplemented by that of his army. In order to dictate peace to Napoleon Trafalgar had to be followed by Waterloo.

From the sketch which has been given of the armed forces it will be seen that they grow and develop with the growth of the State of which they are part. Upon the patriotism of the citizens depends the discipline of its army and navy; upon the development of the industrial arts and sciences depends the quality of the armament and the *matériel;* upon the extent to which the advancement of knowledge is cherished depends the intellectual level of the naval and military leaders. Thus the power of a nation for war depends, as much as its prosperity in peace, upon its keeping in the van of civilisation.

An immense effort is needed to maintain the armed forces. They are among the principal organs of the State and their maintenance in peace is usually the chief item of national expenditure and of the burden of taxation. The cost of a war in money alone is usually far too great to be met out of current taxation, and involves borrowing on a large scale. It sometimes exhausts the national credit, and even where this is not the case a serious war causes a great increase in taxation, of which the burden is felt by more than one generation.

THE ECONOMY OF FORCES

From these considerations follows the supreme importance in war of the economy of forces. To waste them by misuse is wantonly to squander not only men's savings but their lives. The statesman is concerned with the purpose for which the nation goes to war. Whatever the origin of the quarrel the end he has in view is peace consistent with the welfare of his nation. It may be the conquest of the enemy State; it may be merely to induce the enemy to leave his own State unmolested. These are the two extremes, between which will be found the conditions of the peace desired. Whatever those conditions, whatever the statesman's object, the best way of attaining it is by using the armed forces to disarm the enemy State. If the enemy agrees to the terms before he is disarmed so much the better.

The strategist is not directly concerned with the terms of peace; his aim is simply to render the enemy's forces helpless. A large part of the failures in war are due to the mistaken action of governments in directing their commanders to use their forces in a manner inconsistent with their nature or for aims other than the destruction of the enemy armed forces.

It is a misuse of weapons to require a fleet to fight against an army, especially against a fortress, for a ship is much more vul-

nerable than a fort and the loss of a battle-ship with its crew much more serious than that which a fleet can inflict on the garrison of a fortress. In 1739 the British Government, going to war with Spain, employed a large part of its navy in expeditions against the Spanish colonies in South America, with disastrous results. The right use of the navy would have been to devote its whole strength to the destruction of the Spanish navy, after which the Spanish colonies abroad would have been comparatively helpless. In 1807 a British government sent a fleet under Admiral Duckworth to attack Constantinople; without an army he found that he could do nothing, yet in 1915 a British government again sent out a fleet with the same object; without an army it was unable to pass the Dardanelles of which it engaged the forts at a disadvantage.

Nothing is more wasteful than a dispersion of forces caused by a multiplicity of aims. If hostile forces are acting in more than one theatre of war it is prudent to place the principal army in that one where the enemy is most dangerous or where it is practicable to deliver the most deadly blow against him. In other theatres no more forces should be employed than are required to parry the enemy's blows until the decisive stroke in the principal theatre has had time to produce its effect.

The division of armies is frequently caused by the interference of statesmen. In 1745 France and Spain being at war with Sardinia and Austria, a Franco-Spanish army from the Riviera invaded Piedmont and defeated the Piedmontese army. It then found itself between that and an Austrian army. The purpose of the Spanish government in the war was to annex Milan and other territories. It therefore sent orders to the Spanish commander to leave his French colleague and to occupy Milan. Thus the French and Spanish armies were separated at the very moment when their only hope of success lay in keeping together. The consequence was that they were beaten each in turn and when eventually united were attacked by the Piedmontese and the Austrians in concert, defeated and forced to a disastrous retreat. The occupation of Milan was a political but not a military measure; it deflected the Spanish army from its proper use.

The act of war consists in the destruction of men's bodies and of the work of their hands. There is nothing in the nature of the act to limit this destruction. In some cases it has ended with the destruction of one of the States engaged and even the disappearance of its population by massacre or enslavement. In practice there are limitations to the application of violence. They are imposed either by the State itself or by its relations with the neutral States. As the very existence of the State depends upon the discipline of its soldiers and the character of its people it cannot permit actions which would undermine that discipline or would be inconsistent with the maintenance of that character.

From the earliest times States at war with one another have refrained from some of the forms of cruelty practised by savages. The States of the old Mediterranean world observed a number of usages in and with regard to war. Declaration of war, truce, armistice, quarter and the distinction between soldiers and the unarmed population were recognised. In the Middle Ages the States of Christendom and those of the Mohammedan world usually refrained from extreme barbarity. Chivalry, with the idea of honour, set up standards of conduct in the fight. Since the Renaissance, jurists have from time to time formulated principles underlying the usages commonly accepted as binding by belligerents. These form the substance of international law.

Since the middle of the nineteenth century a number of international agreements formulating them have been drawn up and accepted by all or almost all of the civilised States.

ARBITRATION

Both in ancient and modern times disagreements between States have frequently been settled by arbitration, a method evidently suitable for cases in which the matter in dispute is not of supreme importance. But a dispute on a matter vital to each side is settled only by an appeal to force. A Government's mission being to secure for its people a life worth living, its claim to the allegiance of its subjects depends on its fulfilment of this task. Nothing else is vital. If therefore the action of one State, felt by itself to be necessary to its well-being, interferes with the activity, also felt to be necessary to its welfare, of another State, no concession is possible, for in either case it would be felt to be suicidal. There will then be a war of which the logical outcome would be the destruction of one of the belligerents.

Each will set out to crush the forces of the other. The effort will be supreme on each side, and, as the struggle goes on, the people of each State will again and again consider the sacrifices required from them in relation to the cause they are asserting. If the effort is felt to be disproportionate to the end, there will be a relaxation of energy; and the Government will be obliged to seek peace at the price of concession. But the other State, if its cause still seems vital, will renew its exertions again and again. The State which mistook for vital a cause that was not will find itself weaker than its adversary and compelled to give way. Accordingly no State can safely enter into a quarrel except for a cause imposed upon it by the conditions of its existence. It can afford to fight a powerful adversary only to preserve its power to carry on its necessary work.

The decision as to what is vital is primarily the affair of the Government as trustee for the people to whom it is responsible, for they must bear the burden and their welfare is at stake. Victory will strengthen and defeat will weaken the bond between Government and people. But the final judgment is the event; the war was the trial, the victorious State has made good its case. If the defeated State has not been destroyed its survival proves that its cause was not vital. Thus the moral responsibility of nations, as of men, that by their actions they stand or fall, is brought home to them by war, the supreme test of national life. The significance of that self-determination which is the watchword of modern democracy is that it involves the realisation of this responsibility.

Suppose that two States, having agreed in case of any disputes between them to submit the question at issue to an arbitral tribunal and to accept and abide by its decision, find themselves at issue upon a question involving consequences vital to each of them. In that case an adverse decision would mean to either State that it could no longer fulfil the purpose of its existence. Its government and its people would feel that to accept the adverse decision would be fatal to their welfare. They would therefore either refuse to submit the matter to arbitration or to accept an adverse decision. In spite of the treaty there would be a war, in which each side would believe itself to be fighting for its existence. A State cannot renounce its function of self-preservation, self-determination or self-assertion. It will exert itself to the utmost to safeguard and to maintain the necessary activities of its people. This is admitted even by the extreme advocates of arbitration. Mr. Kellogg, who on behalf of the United States proposed the international treaty for "The Outlawry of War," is reported to have said: "Every nation is free at all times and regardless of treaty provisions to defend its territory from attack or invasion and it alone is competent to decide whether the circumstances require recourse to war in self-defence." Self-defence hardly admits of any interpretation except the assertion of vital interests. Mr. Kellogg therefore seems to realise that the treaty which he proposes might be a dead letter in any case of opposition between the vital interests of the States concerned.

It follows that proposals of disarmament can have only a restricted scope, for no nation can afford to allow its armed forces to fall below the strength required for the assertion of its vital interests.

THE IDEA OF PERPETUAL PEACE

After every great European war the sufferings which it has caused have turned men's minds towards the idea of perpetual peace. The War of the Spanish Succession was the occasion of the project of the Abbé de Saint Pierre. It was a scheme by which the peace of Europe was to be under the protection of France, and therefore savoured rather of Sully's design to secure French ascendancy in Europe than of a serious contribution to the world's peace. The French Revolutionary War seems to have suggested Kant's Essay: "Towards Perpetual Peace." Kant thought that

the first condition was that all the States should become Republics —in other words that nations should become responsible for their actions in the sense in which responsibility has here been defined. The World War has been followed by the formation of the League of Nations and by treaties for the purpose of preventing as far as possible the recurrence of war by the substitution for it of international law. In order to become imperative, international law requires behind it the sanction of force, which can only be that of some kind of super-State or world-State. A world-State can hardly be imagined except as the outcome either of the conquest by one State of all the others, after the fashion of the Roman Empire, or of a federation of all States, brought about by their agreement, after the model of the United States.

The problem can hardly better be illustrated than by these two examples. The Roman Empire maintained peace within its borders with little interruption for some centuries; but it contained two different societies, the products respectively of Greek and of Roman civilisation, which could not permanently be held together. The super-State broke down. The history of the Middle Ages is that of the failure of the attempt to revive it in the dual form of the papacy and the Holy Roman Empire, and the modern history of Europe is that of the rise of a number of States in rivalry, leading to a balance of power between the greater States and the consequent preservation of the small ones.

The British settlements in North America first realised themselves in reaction against the authority of the British Government. They were all substantially British in race, language, institutions and traditions, and in the impulse of self-government. Their self-assertion by war compelled them to find strength in union. The thirteen States evolved a super-State, the Federal Government. As their people spread westward across the Continent they spontaneously formed further States within the super-State. But in spite of their original unity of race, language and traditions, there developed among them two types of society, for in the South agriculture came to be based upon negro slavery, while in the North agriculture and industry alike were carried on without slave labour. The two systems proved incompatible with one another, and the inevitable result was the War of Secession.

The moral seems to be that war is the outcome of the growth of societies which can never be uniform, but varies with varying conditions of climate, land, race, religion and tradition. No super-State can prevent this diversity nor repress the expansion of a vigorous community. The establishment of a world-State would no doubt be the end of international wars, but they would reappear as civil wars.

WAR, ARTICLES OF. A code of regulations for the disciplinary government of armed forces. The terms "Laws and Ordinances of War," "Military Law," "Military Discipline Act," "Mutiny Act" and "Military Penal Code" are synonyms for "Articles of War," although this term is still in use in the United States. They all denote the system of rules, superadded to the common law of a country, which regulate the conduct and life of a citizen in his character as a member of the armed forces of his country. The "Statutes, Ordinances and Customs" of Richard II., issued about 1385, appear to be the earliest complete code—*see* the *Manual of Military Law* (Gt. Britain) and *The Journal of the Society of Army Historical Research*, vol. iv.

WAR, LAWS OF: *see* LAWS OF WAR.

WARANGAL, an ancient town of India, in the Nizam's Dominions or Hyderabad state, 86 m. N.E. of Hyderabad city. It was the capital of a Hindu kingdom in the 12th century, but little remains to denote its former grandeur except a fort and four gateways of a temple of Siva. Warangal has given its name to a district and a division of the state.

WARBECK, PERKIN (*c.* 1474–1499), pretender to the throne of England, was the son of Jehan de Werbecque, a poor burgess of Tournay in Flanders and of his wife Katherine de Faro. The exact date of his birth is unknown, but he represented himself as having been nine years old in 1483. The names of his father and other relations whom he mentions have been found in the muncipal records of Tournay, and the official description of them agrees with his statements in the confession made at the end of his life. According to this version, which may be accepted as substantially true, he was brought up at Antwerp by a cousin Jehan Stienbecks, and served various employers as a boy servant. He was for a time with an Englishman John Strewe at Middleburg, and then accompanied Lady Brampton, the wife of an exiled partisan of the House of York, to Portugal. He was for a year employed by a Portuguese knight whom he described as having only one eye, and whom he names Vacz de Cogna. In 1491 he was at Cork as the servant of a Breton silk merchant Pregent (Pierre Jean) Meno. Ireland was strongly attached to the house of York. Perkins says that the people seeing him dressed in the silks of his master took him for a person of distinction, and insisted that he must be either the son of George, duke of Clarence, or a bastard of Richard III. He was more or less encouraged by the earls of Desmond and Kildare. At this time he spoke English badly.

In 1492 he was summoned to Flanders by Margaret, sister of Edward IV., who was the main support of the Yorkist exiles. The suppositions that he was the son of Clarence or of Richard III. were discarded in favour of the more useful idea that he was Richard, brother of Edward V. Charles VIII., king of France, the counsellors of the youthful duke of Burgundy, Maximilian, king of the Romans, and James IV. of Scotland, none of whom can have been really deceived, took up his cause. He was entertained in France and at Vienna as the lawful king of England. The English Government knew his real history, and tried to seize him.

In July 1495 he was provided with a few ships and men by Maximilian, now emperor, and he appeared on the coast of Kent. No movement in his favour took place. A few of his followers who landed were cut off, and he went to Ireland to join the earl of Desmond in Munster. After an unsuccessful attack on Waterford in August, he fled to Scotland. Here James IV. showed him favour, and arranged his marriage with Catherine Gordon, daughter of the earl of Huntly. He made a short inroad into Northumberland, but the intervention of the Spanish Government brought peace between England and Scotland. In 1497 Perkin was sent on his travels again with two or three small vessels. After some obscure adventures in Ireland, he landed at Whitesand bay, near the Land's End, on Sept. 7, and was joined by a crowd of the country people. He advanced to Exeter, but on the approach of

the royal troops he deserted his followers, and ran to the sanctuary of Beaulieu in Hampshire. He then surrendered. His wife was kindly treated and placed in the household of Henry's queen, Elizabeth. Perkin was compelled to make two ignominious public confessions at Westminster, and in Cheapside on June 15 and 19, 1498. On Nov. 23, 1499 he was hanged for endeavouring to escape from the Tower with the imprisoned earl of Warwick.

See James Gairdner, *Richard the Third, and the Story of Perkin Warbeck* (Cambridge, 1898).

WARBLER, the general name for all birds of the Passerine families *Sylviidae* and *Mniotiltidae,* the *Mniotiltidae* being unrelated to the *Sylviidae* and being confined to the new world. The *Sylviidae* are small birds with weak, slender bills, feeding on insects and fruit. The song is clear and sweet and often metallic; the nest is usually cup-shaped, containing from three to six white eggs. Apart from the American kinglets and gnatcatchers (*q.v.*) the family is confined to the old world. The sedge-warbler (*Acrocephalus schoenobaenus*) is one of the commonest British species. It is a small olive-brown bird, with a yellowish eye-streak and a chattering song. It inhabits bushes and reed-beds usually close to water. The nearly allied reed-warbler (*A. scirpaceus*) lacks the eye-streak and rarely leaves reed-beds; its nest is built between and supported by several reed-stems.

The European great reed-warbler (*A. arundinaceus*) is larger. The Dartford warbler (*Sylvia undata*) is one of few warblers resident in Britain, though migratory on the continent. It is locally distributed in the south of England, central Europe and the Mediterranean region. The grasshopper warbler (*Locustella naevia*) inhabits tangled and thick herbage; its reeling song distinguishes it. The allied Savi's warbler (*L. luscinoides*) is confined to marshy country and has a higher pitched song. The icterine warbler (*Hypolais icterina*) is a straggler to Britain; it has a loud song, and the eggs are brownish pink, spotted with purplish black. The wood warbler or wood-wren (*Phylloscopus sibilatrix*) haunts woods of oak and beech and has a peculiar loud song. The willow-warbler or willow-wren (*P. trochilus*) is one of the commonest British species. *See* also GOLDCREST, WHITETHROAT, WREN, BLACKCAP.

The American or wood warblers are, on the whole, a more brightly coloured group and are distributed throughout North and South America and the Antilles. The yellow warbler (*Dendroica aestiva*) breeds throughout North America, wintering in South and Central America. The Cerulean warbler (*D. cerulea*) is less abundant and haunts the tree-tops. The Maryland yellow-throat (*Geothlypsis trichas*), in which the male has a black mask, is another familiar American form. The oven-bird (*Seiurus aurocapillus*) is a common woodland species; its song has been described as a crescendo repetition of the word "teacher." The shy water-thrush (*S. motacilla*) possesses a melodious song. The American redstart (*q.v.*) also belongs to this group.

BIBLIOGRAPHY.—*See* E. Howard, *British Warblers;* F. M. Chapman, *The Warblers of North America* (1907).

WARBURTON, ELIOT [BARTHOLOMEW ELLIOTT GEORGE] (1810–1852), British traveller and novelist, was born in 1810 near Tullamore, Ireland. He was educated at Trinity college, Cambridge, and was called to the Irish bar in 1837. He made a hit with his first book, *The Crescent and the Cross,* an account of his travels in 1843 in Turkey, Syria, Palestine and Egypt. His most substantial work was a *Memoir of Prince Rupert and the Cavaliers* (1849), enriched with original documents, and written with eloquent partiality for the subject. Warburton was on his way to explore the isthmus of Darien, when the ship in which he sailed was destroyed by fire (Jan. 4, 1852).

His other works include two historical novels: *Reginald Hastings* (1850), and *Darien, or the Merchant Prince* (1851).

WARBURTON, COLONEL SIR ROBERT (1842–1899), Anglo-Indian soldier and administrator, was the son of an artillery officer who had been taken prisoner at Kabul in 1842, and married an Afghan princess. Warburton entered the Royal Artillery in 1861, took part in the Abyssinian War of 1867–68, and then joined the Bengal Staff Corps. He served with distinction in the expedition against the Utman Khel in 1878 and in the Afghan War of 1878–80. Warburton was political officer in the Khyber between 1879 and 1882 with intervals of other duty, and continuously from 1882 until 1890. He turned the rude levies which formed the Khyber Rifles into a fine corps, made the road safe, and kept the Afridis friendly. When the Afridis began to cause anxiety in 1897, Colonel Warburton was sent for by the government, but he arrived too late to check the rising. He retired after the campaign. He died at Kensington on April 22, 1899.

See his *Eighteen Years in the Khyber* (1900).

WARBURTON, WILLIAM (1698–1779), English critic and divine, bishop of Gloucester, was born at Newark Dec. 4, 1698, son of the town clerk of Newark. William was articled an attorney, left the law and in 1727 was ordained priest by the bishop of London. At Brant Broughton, Lincolnshire, of which parish he became incumbent in 1728, Warburton spent eighteen years in study, the first result of which was his treatise on the *Alliance between Church and State* (1736). The book brought Warburton into favour at court, and he probably only missed immediate preferment by the death of Queen Caroline. His next and best-known work, *Divine Legation of Moses demonstrated on the Principles of a Religious Deist* (2 vols., 1737–1741), preserves his name as the author of a daring and ingenious theological paradox. The deists had made the absence of any inculcation of the doctrine of a future life an objection to the divine authority of the Mosaic writings. Warburton boldly admitted the fact and turned it against the adversary by maintaining that no merely human legislator would have omitted such a sanction of morality.

He now entered on a defence of Pope's *Essay on Man* against the *Examen* of Jean Pierre de Crousaz, in a series of articles (1738–1739) contributed to *The Works of the Learned.* These articles brought him the friendship of Pope, whom he persuaded to add a fourth book to the *Dunciad,* and encouraged to substitute Cibber for Theobald as the hero of the poem in the 1743 edition published under the editorship of Warburton. Pope bequeathed him the copyright and the editorship of his works, and introduced him to Murray, afterwards Lord Mansfield, who obtained for him in 1746 the preachership of Lincoln's Inn, and to Ralph Allen, who, says Johnson, "gave him his niece and his estate, and, by consequence, a bishopric." After his marriage Warburton resided principally at his father-in-law's estate at Prior Park, Gloucestershire, which he inherited on Allen's death in 1764.

In 1747 appeared his edition of Shakespeare, into which, as he expressed it, Pope's earlier edition was melted down. He had previously entrusted notes and emendations on Shakespeare to Sir Thomas Hanmer, whose unauthorized use of them led to a heated controversy. As early as 1727 Warburton had corresponded with Theobald on Shakespearean subjects. He now accused him of stealing his ideas and denied his critical ability. Theobald's superiority to Warburton as a Shakespearean critic has long since been acknowledged. Warburton was further kept busy by the attacks on his *Divine Legation* from all quarters, by a dispute with Bolingbroke respecting Pope's behaviour in the affair of Bolingbroke's *Patriot King,* by his edition of Pope's works (1751) and by a vindication in 1750 of the alleged miraculous interruption of the rebuilding of the temple of Jerusalem undertaken by Julian, in answer to Conyers Middleton. Warburton's manner of dealing with opponents was both insolent and rancorous, but it did him no disservice. He became prebendary of Gloucester (1753), chaplain to the king (1754), prebendary of Durham (1755), dean of Bristol (1757) and in 1759 bishop of Gloucester. He toiled to complete the *Divine Legation* but failed. He wrote a defence of revealed religion in his *View of Lord Bolingbroke's Philosophy* (1754), and Hume's *Natural History of Religion* called forth some *Remarks* . . . "by a gentleman of Cambridge" from Warburton, in which his friend and biographer, Richard Hurd, had a share (1757). He made in 1762 a vigorous attack on Methodism under the title of *The Doctrine of Grace.* He died at Gloucester on June 7, 1779.

Warburton's works were edited (7 vols., 1788) by Bishop Hurd with a biographical preface, and the correspondence between the two friends—an important contribution to the literary history of the period—was edited by Dr. Parr in 1808. Warburton's life was also written

by John Selby Watson in 1863, and Mark Pattison made him the subject of an essay in 1889. *See* also I. D'Israeli, *Quarrels of Authors* (1814); and especially John Nichols, *Literary Anecdotes* (1812–15), vol. v., and *Illustrations* (1817–58), vol. ii., for his correspondence with William Stukeley, Peter des Maizeaux, Thomas Birch, John Jortin and Lewis Theobald.

WAR COLLEGE, an institution for the instruction of officers in the higher branches of the military art. The French École de Guerre corresponds to our Staff College, and trains prospective staff officers. First founded in 1821, it was established in 1881 in its present location in Paris. It trains about one hundred candidates a year. Admission is by competitive examination open to officers of all arms between the ages of 28 and 38. The period of the course is two years, and the curriculum includes lectures and exercises on every branch of the art of war, and on kindred subjects such as politics, economics, naval questions, geography, and international law, together with war games, visits, tours and staff rides. At the end of the course officers satisfactorily reported on become eligible for staff posts.

The United States Army War College at Washington forms part of the General Service Schools and trains officers in high command and for General Staff duty in the War Department. The course forms the fourth and last year of the period of four years at the Schools and only those officers who have satisfactorily completed the prior courses are eligible to attend.

WAR CONTROL OF FOOD. During the World War of 1914–18 practically all the belligerent and neutral countries of Europe experienced a shortage in the supply of food and other necessaries. The shortage was traceable to three distinct causes: first, the diversion of productive power to destruction or to making the means of destruction; second, the increased rate of consumption of those who were fighting or were undertaking harder physical labour than usual in the production of munitions; third, the deliberate blockades which with varying success the belligerents directed against one another and against neutrals. The blockades had as one feature a destruction of shipping. Food control became a feature of the war, and the food controller had three main problems to consider, namely, the maintenance of supplies, the regulation of prices and the control of consumption by distribution and rationing. The three problems are naturally connected. A solution of the first of them so complete as to keep supplies up to or above the pre-war standard would prevent the other two from arising at all or at least in any serious form; this happened with bread-stuffs in Great Britain. On the other hand an attempt to fix prices without controlling supplies would lead either to a disappearance of supplies or to their distribution in an unjust and wasteful manner.

I. IN GREAT BRITAIN

For the first two years of the war questions of food control attained little prominence in Great Britain. The cutting off of the central European sources of sugar supply led to the anticipation of a considerable shortage of that particular food, and a royal commission was established in Aug. 1914, which undertook on Government account the purchase and importation of all sugar from that time onwards. A special organization for securing meat for the army from abroad was also found necessary from the beginning; this involved control of refrigerated tonnage under the Board of Trade. The use of cereals and sugar for brewing was limited by an Output of Beer Restriction Act, coming into force on April 1, 1916.

By the autumn of 1916, prices, which had risen more or less steadily from the beginning of the war, reached a level which began to evoke acute discontent and the prospects of an intensified submarine campaign caused anxieties for the future. Two important steps were taken. The first was the establishment in Oct. 1916 of a royal commission on wheat supplies, parallel to that on the sugar supplies. This commission almost immediately took on an international character through the signing in Nov. 1916 of the "Wheat Executive Agreement" between Great Britain, France and Italy, under which the purchase, importation, distribution and shipping not only of wheat but of all cereals was arranged on a common basis for the three Allies, the administrative work being undertaken in London. The wheat executive gradually extended its activities to other Allies and even to neutrals.

The second step was the making on Nov. 16 of an Order in Council under the Defence of the Realm Act which practically empowered the Board of Trade to introduce a complete system of food control, by regulating the importation, production, distribution, prices and quality of all kinds of food or articles necessary for the production of food.

The first holder of the new post, Lord Devonport, who actually began work on Dec. 11, gave valuable support to the wheat commission in securing adequate tonnage and foreign credits, and carried a stage further the policy of conservation of cereals already embodied in the Output of Beer Restriction Act and a Board of Trade order lengthening the extraction of flour. To facilitate this the whole of the flour-mills were taken over and run on Government account as from April 1917.

Apart from cereals, no substantial extension of food control took place till the appointment of the second food controller—Lord Rhondda—who succeeded Lord Devonport in June 1917, and at once prepared himself and the Ministry of Food to deal thoroughly with the three problems of supplies, prices and distribution. First he attacked prices. In Sept. 1917 the price of bread was lowered from 1s. or 1s.1d. to 9d. for the quartern loaf, the difference being paid by the Government as a subsidy. At about the same time there was fixed a scale of prices for meat and for live-stock, descending month by month from 74s. per cwt. in Sept. 1917 to 60s. in the following January. The fixing of meat and live-stock prices needed to be and was intended to be accompanied by measures for regulating slaughter and marketing, but for various reasons the latter measures did not become effective till the end of 1917. The scale of prices standing by itself gave the farmers a strong inducement to hurry on their beasts to market, so as to profit by the early high prices and avoid the later low ones; too many beasts were thrown on the market before Christmas and too few were kept for the new year; how the ensuing shortage, aggravated by large purchases of home-grown meat for the army and by other circumstances, was dealt with by rationing in the early part of 1918 is described below.

On the general principle of controlling supplies of all essential foods as a condition of fixing prices Lord Rhondda never hesitated. This policy was carried out most completely in the case of imports. Cereals and sugar were already being imported by the two commissions. Under Lord Rhondda all bacon, ham, lard, cheese, butter and similar provisions, all oils and fats (edible and otherwise), condensed milk, canned meat and fish, eggs, tea and even such extras as apples, oranges, jam and dried fruits, brought into Great Britain came to be directly imported by the Ministry of Food or requisitioned on arrival. All home-produced meat and cheese and most of the butter passed through the hands of the ministry, as also, through the control of flour-mills, did all the wheat and most of the barley. Even the whole potato crop of 1918 was taken over under a scheme framed in the time of Lord Rhondda, though not put into force till after his death. The only important exceptions were milk, fresh fish and fresh vegetables. The total turnover of the ministry's trading (including the two royal commissions) was at the rate of nearly £900,000,000 a year.

A British Food Budget.—Lord Rhondda made a budget of the food required for the country as a whole, and then took steps to see that that amount of food was available. This was partly a matter of securing imports; for there was needed, on the one hand tonnage, and on the other finance, that is to say, foreign credits. The Ministry of Food acting through or with the Governments concerned made bargains with the producers for the whole exportable surplus of Canadian cheese or Australian wheat or American bacon. It was partly a matter of encouraging food production at home. A vigorous food production campaign was started under the Ministry of Agriculture, and the Ministry of Food co-operated with the agricultural departments, in fixing only such prices as appeared likely to secure adequate supplies. In effect, in fixing prices for home produce, it made bargains with the farmers as to the prices at which, with whatever show of reluctance or grumbling, they would be able and willing to produce and to deliver

their produce to the ministry or its agents. The legal power of the ministry to fix any prices it thought good was absolute; the prices for home produce were actually fixed only after apparently interminable consultations, and were prices which could be expected to secure production of the required supplies, and did in fact do so.

The largest single source of imported supplies was the United States. Here a special department of the ministry was established (Oct. 1917), to purchase on its behalf all food-stuffs other than cereals, for which an organization already existed in the Wheat Export Co.; a branch in Toronto dealt with Canadian supplies. The department speedily grew into an international organization of vast scope; the "Allied Export Provisions Commission" purchased between Oct. 1917 and Feb. 1919 nearly 2¼ million tons of food valued at £267,000,000, at a cost for administration amounting to about $\frac{1}{15}$ of 1% on this turnover. All these figures exclude cereals and sugar.

The success of this policy of ensuring supplies by direct purchase abroad and consultation at home was unquestionable. Great Britain came nearer than any other European country to maintaining during the war a pre-war standard of supplies, and at the same time achieved a far more equitable distribution.

Control of Prices and Consumption.—Upon control of supplies was founded control of prices. Once goods were in the hands of the ministry it remained only to fix the margins of profit to be allowed to the various classes of distributors and the resulting prices to the public. Ultimately out of everything consumed in Great Britain by way of food and drink, 94% was subject to fixed maximum prices. Almost the only articles untouched were fresh vegetables, canned fruits, honey, salt, vinegar, spices, aerated waters and meals in restaurants.

After two years of comparative plenty the sugar commission in Nov. 1916 cut down the supplies it would issue to any wholesaler to 60% of the amount issued in 1915, and required each wholesaler to pass on supplies to retailers, manufacturers and others in the same proportion. This "datum period" principle of distribution represented a stage through which not only sugar, but most other foods (notably meat, bacon, butter and tea) passed as scarcity developed. For dealing with any acute shortage of supplies it soon proved unsatisfactory, partly because it made no allowance for changes in the channels of trade or in the distribution of the population, but mainly because it gave no assurance at all of supplies to any individual consumer. That could be given only by issuing to each consumer a ration book or other document as authority to purchase a fixed ration, requiring him to register with a particular retailer and authorizing the retailer in turn to purchase from his suppliers week by week or month by month enough to meet the rations of his registered customers. After prolonged delay, due to changes of policy and the war cabinet's fear of causing industrial unrest and encouraging Germany to believe in the success of the submarines, compulsory rationing was introduced for sugar on Jan. 1, 1917, and worked smoothly. Just before that date acute shortage of butter and margarine and tea had begun to show itself and led to the formation of "queues" of would-be purchasers before any shop that was thought to have supplies. Just after that date the temporary abundance of meat, caused or intensified by the descending scale of live-stock prices, ended suddenly and was replaced by something like a famine. Outside London the problem of the queues was at first dealt with by giving the food committees described below power to introduce local rationing schemes under the Food Control Committees (Local Distribution) Order of Dec. 22, 1917. For London a single rationing scheme for butter, margarine and meat, covering the home counties also and a total population of nearly 10,000,000, was put into force on Feb. 25, 1918.

Success of Food Rationing.—The scheme had an instant and almost unqualified success. During January and February the London food queues had attained gigantic proportions; about 500,000 were counted by the police standing in them every Saturday, and another 1,000,000 on the other days of the week. In the first week of rationing the numbers fell to about 200,000 and in the fourth to 14,000, that is to say, they practically vanished. On April 7, 1918, meat rationing on the London model was applied successfully to the whole country.

Finally on July 14, 1918, after nearly four years of the war and less than six months from its end, all the varying schemes were consolidated. To buy any of the necessities, the consumer had to have a ration book with coupons for the amounts that he might buy, to register with a particular shop and to present the ration book on making a purchase, so that the retailer could detach the appropriate coupons. The amount represented by each coupon and also the amount of the ration varied from time to time. Thus for sugar the weekly ration was usually 8 oz. a head, but was 12 oz. during most of 1919, and as low as 6 oz. from Jan. to March 1920. For butchers' meat till the end of 1918 the ration varied from 14½ oz. to about 1 lb., with half for children.

When Lord Rhondda died (July 3, 1918), British control on a national basis was practically complete. Soon after, food control was placed, like shipping and finance, on an international basis by the setting up in Aug. 1918 of an Allied Food Council consisting of the four food controllers of Britain, France, Italy and the United States, with a standing "Committee of Representatives." There was thus extended to food generally the plan already in force in respect of cereals (and to a less extent sugar and one or two other articles).

Effect of Atlantic Concentration.—By the latter part of 1918, the submarine menace had been practically mastered by the convoy system, and the limits of the food problem had been defined by the success of rationing. The greatest pinch of all, however, was apparently still to come. Considerations of shipping dictated a concentration of traffic on the shortest route—the North Atlantic—and the abandonment so far as possible of any attempt to get supplies from the Far South and the Far East (*see* ATLANTIC CONCENTRATION OF SHIPPING). Financial considerations by a natural reaction dictated the exact opposite; the British Treasury had relatively ample sterling credit for purchases in Australia, very few pesos in South America and hardly a cent to spare in the United States or Canada. The Ministry of Food, and other supply departments, constantly found themselves being offered ships only where they could not get credit, and credit only where they could not get ships. On top of this difficulty came, in Sept. 1918, the necessity, as it then appeared, of hastening the transport of the American army so as to deliver a decisive blow in the coming spring. The framing of shipping programmes had by that time reduced itself to a division of two lions' shares between the Ministry of Munitions and the Ministry of Food (or their international extensions), with a few scraps for import of raw cotton or fertilizers and the like; each of these departments was compelled to accept for the winter of 1918–19 a provisional import programme totally inadequate for its needs and to hope that the war would end before its stocks ran out.

This hope was realized. But the Armistice of Nov. 11, 1918, though it ended for the victorious countries the fear of starvation, did not bring food shortage or food control to an end, either in those countries or elsewhere. J. R. Clynes, who from being parliamentary secretary had become food controller on Lord Rhondda's death in July 1918, resigned when the Labour Party left Lloyd George's coalition after the Armistice, but the Ministry of Food continued its work. Cereal prices did not fall to a point allowing the bread subsidy to be dropped and the control of flour-mills abandoned till after the harvest of 1920; the wheat commission continued executive work till the autumn of 1921, and liquidation of accounts till 1925. Sugar prices reached fantastic heights in the first half of 1920 (on decontrol by the American Government) and the sugar ration at the same time reached its lowest point; sugar rationing continued till the following November and the sugar commission till March 1921.

A reason for not hastening the end of food control in 1919 appeared in the disturbed condition of industry and the perpetual threat of paralysis in the essential services of coal or transport. The success with which, during the railway strike of Oct. 1919, the supplies and distribution even of perishable foods were maintained by the Ministry of Food shed lustre on its closing period.

Prior to the crisis, a fresh registration of consumers for rationing was carried through in Sept. 1919. In the following

winter, the ministry was again under attack and after the resignation of the fourth food controller—G. H. Roberts—in Feb. 1920, was left for a month without any controller at all. The appointment of C. A. McCurdy as the fifth controller marked a return of the spirit of control. The ministry secured in July the passage of a Continuance Act, only to be swept out of existence by a parliamentary storm. It ended formally in March 1921.

Supplies and Prices.—At the end of 1918 the Ministry of Food issued a short memorandum with tables and diagrams illustrating its work under the four main heads of supplies, stocks, prices and rationing. A comparison is made in the accompanying table of the amounts of the principal food-stuffs available per head for consumption in 1918, and before the war, in Germany and Holland:—

Weekly Domestic Consumption of Bread, Meat, Fats and Sugar per Head per Week in Great Britain, Germany and Holland. Pre-war and 1918

Food-Stuff	Great Britain		Germany.		Holland.	
	Pre-war.	1918.	Pre-war.	1918.	Pre-war.	1918.
	Lb.	Lb.	Lb.	Lb.	Lb.	Lb.
Bread and flour	6·12	6·57	6·44	4·06	7·25	3·06
Meats	2·50	1·54	2·25	0·49	1·50	0·44
Sugar	..	0·50	.	0·33	.	0·52
Fats	0·51	0·45	0·56	0·15	0·70	0·37

The consumption during 1918 is based on the rations, except in the case of bread in Great Britain, where the actual consumption is taken. In the case of sugar no figure of pre-war domestic consumption is given by the Ministry of Food; it is commonly estimated at about 1 lb. per head per week.

It appears from the table that in 1918 Great Britain "had half as much bread again as Germany, three times as much meat and fat and substantially more sugar. As compared with Holland, Great Britain had twice as much bread, three times as much meat, more fats and practically the same amount of sugar."

The course of prices is shown in two stages: one from July 1914 to July 1917, when the main development of food control in Great Britain began, and the other from July 1917 to Oct. 1918.

Rise in Price of Food and Other Necessary Articles in Great Britain. (Price in July 1914 = 100.)

Classification	July 1917.	Oct. 1917.	July 1918.	Oct. 1918.	Average monthly increase between	
					July, 1914 and July, 1917.	July, 1917 and Oct., 1918.
Principal controlled foods	205	194	202	216	2·92	0·73
Principal controlled foods assuming no subsidy on bread	205	205	208	232	2·92	1·86
Principal uncontrolled foods	186	229	311	347	2·39	10·73
All principal foods	203	198	213	229	2·87	1 73
Textiles, leather, etc.	234	245	294	313	3·72	5·27
Coal	135	135	163	177	0·97	2·80
Soap	133	150	233	233	0·92	6·67
Candles	184	184	329	348	2·33	10·93
Household oils	215	286	319	319	3·20	6·93

The machinery required for "control" was very extensive. The staff numbered at its maximum over 8,000. In addition the local food control committees employed varying numbers, rising at times of exceptional pressure to as many as 25,000 persons. The printing and stationery bill for a single year exceeded £1,500,000. Expenditure, however, did not fall on the taxes but was covered by a trifling percentage on the price of the articles in which the ministry dealt. Apart from the wheat commission which as a matter of policy was compelled to make a loss on th bread subsidy (amounting to £138,000,000 net) and the suga commission which also as a matter of policy was not allowed t raise its prices sufficiently in 1919 and 1920 (so that it ende £22,000,000 to the bad in 1921 instead of being £6,000,000 to th good as at the Armistice), the Ministry of Food proper on all it transactions from 1917 to 1921 made a net profit of abou £7,000,000 after paying expenses, on its turnover of £1,200, 000,000. Two minor features may be mentioned as havin simplified the British task. One is the concentration of the grea bulk of flour-milling in Great Britain in a small number of im portant mills (less than 700), which could be easily controlled Next, there was the limited power of the British municipa authorities. In Germany it was the natural thing for the separat municipal councils to act as independent organs of food control making their own contracts with neighbouring rural districts fo the supply of food to their citizens, fixing prices in their market and rationing when need arose. This made possible competition confusion and difference of standard between the authorities, an made difficult a survey of the nation's needs and resources as a whole. In Great Britain, Lord Rhondda, as house-keeper for a family of forty millions, made single bargains.

There were about 2,000 food control committees, which wer technically independent of the ministry, being appointed by th local sanitary authorities, but their expenses were paid by th ministry. In building up his own staff Lord Rhondda used men o outstanding experience in their own trades, as individuals or o committees, to deal with each particular food, but he placed th experts always under the control of laymen.

The Food Ministry had its own newspaper, the *Nationa Food Journal,* placed on sale fortnightly, giving the text of al the ministry's orders, tables of maximum prices, reports of parlia mentary debates and questions and of prosecutions for food of fences, and everything else that could help the public to knov what the food controller required of them and why. Lord Rhondd was fond of describing himself as "on the side of the consume and particularly of the poor consumer." An interesting featur of the ministry was a "consumers' council" established in Jan 1918. This was an advisory body, consisting mainly of representa tives of trade unions and co-operative societies, which did a grea deal to keep the ministry in touch with the feelings and grievance of working-class consumers.

II. IN THE UNITED STATES

Three years of war in Europe had brought the world's food sup ply to a crisis when the United States entered the conflict in Apri 1917. Already the reduced production and increased demand i the warring countries was being felt in America. The price inde of food products at wholesale had risen from 100 in 1913 to 14 in March, 1917. Wheat, which had averaged $0.91 per bushel i 1913, was selling at $2 in the Chicago market, and many othe products had risen in proportion.

Even before declaration of war by Congress, the newly organ ized Council of National Defense had, at the request of Presiden Wilson, cabled to Herbert Hoover asking him to assist in drawin up plans to protect American food supplies. Hoover at that tim was in Europe, where he had been directing the work of the com mission for the relief of Belgium and northern France. The suc cess with which the delicate task of feeding nearly 10,000,00 civilians within the enemy lines had been accomplished had mad him known throughout the world as an authority on internationa food matters. He delayed his return long enough to make a investigation of food control methods in Europe. He returne early in May, 1917, and at the President's request began to la

the foundation for the future food administration. It was not until August 10, 1917, that a Food Control Bill was signed by the President.

On June 10, 1917, President Wilson had authorized Mr. Hoover to build up a voluntary organization particularly directed toward the conservation of food. Under this authority a considerable organization was built up, and plans were perfected for the control of food commodities as soon as the necessary authority should be granted by Congress. The Food Control Act of Aug. 10, 1917, gave the President very broad powers. Among other things it authorized him to create agencies, to accept voluntary services, to license all firms engaged in the manufacture, transportation, and distribution of foodstuffs excepting only common carriers, farmers and retailers doing less than $100,000 worth of business annually. It authorized him to provide rules and regulations for licenses, with drastic penalties for firms which failed or refused to obey these. It prohibited hoarding or wasteful destruction of foods. It authorized the President to requisition supplies needed for the public welfare, to take over and operate food manufacturing, storage, or distributing plants, to purchase, store, and sell for cash certain commodities, and to establish a minimum price for wheat, which for the crop of 1918 must be not less than $2 per bushel.

Immediately after signing the Food Control Act, the president issued an executive order establishing the United States Food Administration and appointing Hoover Food Administrator. By early September, 1917, presidential proclamations had been issued requiring Food Administration licenses. The rules related to the prevention of hoarding and guarding against unfair, unjust, or discriminatory margins of profit. The administration of the regulatory functions was decentralized as far as possible.

Aside from the regulatory functions which were applied to practically all food commodities, three classes of foodstuffs—cereals, sugar and fats—presented the most important problems. The Allied supply of cereals, particularly breadstuffs, had been greatly reduced by inability to secure imports from Russia, the Balkans, or from the Southern Hemisphere, in the last of which the difficulty was the shortage of ocean shipping. In the face of this the United States harvested in 1917 its second successive short crop of wheat. Prior to the American declaration of war, the Allies, by bidding against each other, had forced the price of wheat in the United States to an abnormally high figure. This had caused much hardship to consumers and resulted in exorbitant prices by dealers and millers in attempts to protect themselves against these rapid advances. In the meantime, however, the Allies pooled their buying in a single hand and were in a position to dominate the world market.

In order to assure a fair price to the American farmer and at the same time protect the consumer and provide the Allies with all the cereals that could be spared, Hoover proposed to President Wilson that the Government should create a consolidated cereal selling organization and should determine upon a fair price at which the Government would purchase wheat. This plan was accepted by the President and an independent commission was appointed, with farmer representatives in the majority. This commission recommended a price of $2.20 per bushel for No. 1 Northern wheat at Chicago with differentials for other grades and markets. By executive order the President also created the Food Administration Grain Corporation with a capital of $50,000,000, which in July, 1918, was increased to $150,000,000. He directed the Grain Corporation to purchase all wheat offered to it at the fair price and to resell at the same price such amounts as were needed by the American people and to supply to the Allies the utmost that could be spared.

It was with the greatest difficulty that supplies were obtained to meet the urgent necessities of the Allies in the spring of 1918. By calling upon the people to use substitutes to the utmost and to conserve all the wheat possible, the Food Administration was able to furnish approximately 138,000,000 bushels to the Allied countries from the small 1917 crop. This, together with supplies from Canada and small quantities from the Southern Hemisphere, proved to be sufficient to carry the Allies through. With a relatively large crop in 1918 the question of supplies was largely solved. The Grain Corporation then became chiefly an instrument through which the President's guarantee of a minimum price was maintained. Before the Armistice was signed, this guarantee was extended to the 1919 crop, and the Grain Corporation, with its name changed to the United States Grain Corporation, was designated as the agency to make this effective. The corporation was thus in active existence for 33 months (Sept., 1917, to June, 1920), handling the major portion of three wheat crops. During this time its purchases of wheat and flour were equivalent to about 751 million bushels. It also dealt in other cereals and food products for the Allies. The total value of all commodities purchased during its period of active existence was more than $3,763,000,000.

In the case of sugar, the Allied countries, before the war, were supplied largely by the beet crops of southern and eastern Europe. With this supply cut off by the war, the Allies found it necessary to draw upon Cuban sugar. Cuba had always been the chief source of sugar for the United States. The unexpected demands from Europe quickly demoralized the Cuban market and in addition to a greatly increased price also threatened an acute shortage in this country. Hoover proposed a separate corporation which should purchase the whole of the Cuban crop as well as the American sugar beet crop and should then sell this in accordance with established requirements. In accordance with this plan, the Sugar Equalization Board, incorporated under the laws of Delaware, handled the entire sugar supply of the United States during 1918 and furnished large quantities to the Allied governments. The purchases of sugar by the board amounted to approximately 4,500,000 tons valued at about $712,000,000.

The shortage in fats gave the Allied governments much concern. After some consideration it seemed that the most practical way of increasing these supplies was to stimulate hog production in the United States. Under arrangements in connection with the United States Treasury loans to the Allies, the Food Administration was able to stipulate the price at which pork products were sold for export. Hoover also arranged with the Army, the Navy, the Belgian Relief authorities, and some other buyers to abide by prices to be determined by the Food Administration. With this control of a considerable portion of the market, Hoover next arranged with the packers to pay a fair reflection of these prices to the farmers for their hogs. In return for this assurance, the production of hogs was increased very greatly. Exports of pork products were increased from a pre-war annual average of 930,000,000 pounds to 2,251,000,000 pounds in 1918. No serious difficulty was experienced in maintaining these prices until after the armistice, when the Allies no longer desired such large amounts but when stimulated production had reached its greatest heights. By making huge advance purchases of pork through the Food Administration Grain Corporation and the Commission for the Relief of Belgium, and by his efforts to open up the neutral market, Hoover was able to avert the catastrophe which once threatened the American market. He was later able to dispose of this surplus pork by sales to Germany in return for gold, by sales to the neutrals, and by caring for the relief needs of central Europe.

One of the outstanding accomplishments of the Food Administration was in connection with the conservation of food. The whole country was organized to prevent waste in foodstuffs and to substitute more perishable foods for those which could be shipped to the Allies. These voluntary efforts were guided by widespread publicity and in certain commodities were supplemented by regulations such as requiring the retailer to sell a pound of substitute cereals with every pound of flour and limiting the sugar to two pounds a week for each person. (F. M. Su.)

WAR CONTROL OF SHIPPING. In July, 1914, of 8,000 ocean-going vessels the British Empire owned over 4,000; France, Italy, Belgium and Portugal together owned about 1,000; a further 1,000 were owned by Germany and Austria and were either immobilized or captured; some 2,000 covered the rest of the world. When therefore the Allied organization was developed, in the last year of the war, it was natural that it should be built on the basis of the British system; and the countries associated in this organization, which included the United States, ultimately controlled, with the addition of the neutral tonnage which they had

chartered or requisitioned, some 90% of all ocean-going tonnage.

The control was thus simple in character by comparison with those exercised by the Ministries of Munitions or of Food. The total pre-war value of all ocean-going ships before the war was not more than £300 million, that is, less than the capital invested in two English railway companies. The total amount of steel sunk in the ships lost during the war was only some 5 million tons, that is, not more than 12% of the steel production of America alone in a single year. On the other hand, the allocation of ships involved choosing between different supply services, giving a preference to wheat over munitions, or coal over ore or vice versa. It involved decisions of policy affecting a vastly wider range.

This world fleet must be conceived as in peace time sailing under private ownership and management, subject only to official regulations to secure safety and protect the conditions of the seamen's employment. Half of the British tonnage was under the control of less than a score of the big "liner" companies, which were usually leading members in the International Liner Conferences. The other half, the tramps, were under a much more varying management; they were owned by several hundreds of companies and persons ranging from large and wealthy firms to individual owners of single ships.

The allocation of tonnage was, when the war broke out, effected by the intricate but automatic process of the freight market. Merchants, estimating the demands of their own particular markets in wheat, in wool, in coal and cotton, made their purchases and then looked round for the freight to carry them. Some were able to wait, others must ship at once. Each gave orders to his agent in London on freight exchanges of other ports, such as the Baltic to bid for tonnage within specified quantities, dates and rates. Similarly the owners of disposable tonnage gave instructions to their brokers to accept within specified conditions the best offers available. So the haggle of the market excluded the marginal need and allotted the available tonnage in exact accordance with the relative strength of the economic demand.

Before the war two departments of the British administration were concerned with merchant shipping, the Marine Department of the Board of Trade and the Transport Department of the Admiralty. The first named exercised the whole of such general responsibility as was at that time entrusted to the Government with regard to merchant ships. The Transport Department of the Admiralty, was solely responsible for arranging the transport required by the Government itself and for preparing plans for its more extended requirements in time of war. It chartered passenger vessels to transport troops to and from South Africa, India, Egypt and British garrisons elsewhere. It booked passages for individual officers. It chartered, through local commercial agents, some three or four hundred colliers a year, mostly on single voyage charters, for the supply of the Fleet and the naval bases. It managed a few vessels, a hospital ship, some colliers and oil-fuel vessels owned directly by the Admiralty. It was this little Department, with its limited but varied experience, which was gradually thrust by circumstances and by the submarine into the central position in prominence.

When the war broke out shipping was for the moment paralysed. The risk was unknown and at first almost prohibitive. But the early losses were slight, a carefully prepared system of war insurance was ready and in a short time ordinary business dependent on ocean transport renewed its normal demands, while the new and rapidly increasing call upon shipping made by direct Government requirements forced freights up.

State Requisitions, August, 1914.—From the first it was recognized that the Government could not act as it did in the South African war, and go into the market as an ordinary charterer. In August 1914, a proclamation was issued to requisition ships with compensation to the owner.

The powers were chiefly exercised by the Transport Department. They were limited to the transport of troops from Canada, Australia, India and New Zealand, and to the carriage of supplies from England to France and the Front. But though the tonnage requisitioned in the first six months did not exceed some 20% of the British mercantile marine, it was enough to push freights up. Other causes were tending to the same result. Losses by enemy action were indeed more than offset by new building. But a large mass of enemy tonnage was withdrawn from world tonnage and the delays inevitably caused by naval precautions reduced the average amount of transport a vessel could accomplish in a given time. In July 1914 the normal price for a six-months' charter of an ordinary tramp steamer was 3 shillings a month on the deadweight. By December it had reached 6 shillings. By the end of the first year, in the summer of 1915 it had reached 15 shillings. This increase not only made the goods carried more expensive. It reflected the fact that some goods were shut out altogether for want of freight carriage. And so far the effect of the submarine had scarcely been felt.

Blue Book Rates.—These rates did not apply to ships requisitioned by the Government. For these ships standard rates—the so-called blue book rates—were fixed on the advice of a committee which met in the first months and, with slight modifications, were applied throughout the war without regard to the outside freight market. They were somewhat in excess of the market when they were introduced (the rate for an ordinary tramp was equivalent to about 7 shillings per month on the deadweight) but they were moderate by comparison with the arrangements made by the Government in the industries and would have given profits not exceeding those of a boom year in peace. Shipowners' profits became in 1916 the subject of severe and legitimate criticism. On a capital value of some £172 millions in 1914 British shipping had by the autumn of 1916 made a net profit of some £262 millions (after deducting all payment of taxes). This resulted however not from excessive payments by the Government but from competition in the ordinary freight market for the inadequate tonnage left over when the Government had taken what it needed. Indeed the misfortune which the British shipowner feared most was to have his vessels requisitioned.

Shipping in the Second Year.—The strain upon shipping was constantly increasing. Losses increased, averaging 87,000 tons gross per month as compared with 55,000 in the first year. Building fell from a million tons in the first year to half a million in the second. Naval and military demands increased and the proportion of British tramp tonnage rose steadily from 20% to 30%. The demands upon the freight market for the raw materials required for munitions were also serious, and the standard time charter rate (which had been 3 shillings in July 1914) rose to 27 shillings in Dec. 1915 and to nearly 40 shillings by the summer of 1916. The Government was during this year forced into further measures of control of both supplies and of shipping.

Ship Licensing Committee, Nov. 1916.—In Nov. 1916, a Ship Licensing Committee was appointed by the Board of Trade, with the power to exercise a license control over British tonnage. The intention was to force ships out of employment that were serving no British or Allied interest, and so make it easier for more important requirements to find their transport. The principle was obviously a sound one as far as it could be applied. But the Committee, which was composed of well-known shipowners under the chairmanship of an eminent lawyer, were unable to find, after some months of investigation, more than a negligible amount of tonnage engaged in work that was obviously unimportant; and they were unwilling to prohibit any other employment; therefore they brought no substantial relief to the general situation. However, ineffective for its original purpose, the committee soon assumed a rôle for which it was much better fitted. It was not qualified either by its authority or its constitution to measure or judge between the country's needs. But it was admirably qualified in both respects to apply a policy determined elsewhere to individual ships. It became the executive for putting policy into effect as regards all British tonnage not under requisition. When a "limitation" of freight rates was imposed on the French coal trade it was the Ship Licensing Committee which made it effective by refusing licenses to ships trying to escape from that trade to more lucrative employment. When the Ministry of Munitions was anxious about ore imports from Spain or South Africa because colliers found it profitable to hasten back in ballast for another coal cargo, the Committee refused licenses for

such ballast voyages. When the Cabinet fixed a limit to the tonnage to be chartered to the Allies the committee enforced the decision as regards chartered ships in conjunction with the Transport Department which enforced it as regards requisitioned ships. This last duty had some importance in the development of Allied relations. The limitation of charters involved constant and detailed negotiations with Allied representatives in London as to particular charters.

The second committee established by the Board of Trade at the same time—the Requisitioning (Carriage of Foodstuffs) Committee—had a shorter life. The committee had power, under order in Council, to requisition or direct the employment of British ships so as to assist the importation of food or other accessories. In practice it confined its action to the importation of grain (mainly wheat) and to a novel and limited form of requisition. It did not take a ship, pay so much for it and run it. It merely required the owner to charter in a particular market, *e.g.* (since it was anxiety about wheat imports which had caused the committee to be appointed) to bring a cargo of wheat.

The committee began timidly by directing a smaller amount of tonnage into the wheat trade than the unfettered market was itself attracting. This action was entirely ineffective, the vessels named not being additional to, but merely replacing, others which would have gone if no orders had been given. There were no results upon either imports or freight rates.

The committee then directed more vessels than the market by itself was capable of attracting. The effect was immediate and dramatic. North Atlantic freight rates dropped in five months from 16 shillings to 8. Weekly imports increased from 510,000 quarters to 665,000 quarters. But at the moment when the committee was achieving its objects its activities had to be first restricted and then stopped. The reasons are interesting and instructive. Wheat was getting more than its share of tonnage.

Shipping Control Committees.—Of these the most interesting was the appointment in Jan. 1916 of the Shipping Control Committee, presided over by Lord Curzon and including two well-known shipowners and an eminent financier. A survey led them to the conclusion that a reduction of 13 million tons must be made in British imports, and they therefore recommended the temporary prohibition of all imports, except specified essentials, amounting to a total rate of 13 million tons per annum; the withdrawal of vessels from naval and military service; and the limitation of British tonnage allotted to the Allies to the amount in their service on April 1, 1916. Little came of their three recommendations. A scheme of import prohibitions which, even if fully enforced, would have shut out not 13 million but 4 million tons was approved but in actual application excluded less than 2 million tons.

Imports Restriction.—In 1917 the Government appointed an Imports Restriction Committee, presided over by Sir Henry Babington Smith and consisting of the principal officials of the Board of Trade, the Ministry of Shipping (into which the Transport Department had now expanded) and the chief departments demanding tonnage: the War Office, Ministry of Munitions, Food Commission, etc. The instructions given to the committee were to reduce the supply programmes by about half a million tons a month. It is possible that they would have been practicable and would have met the situation. But just as the committee was beginning its work, the intensive submarine campaign began; shipping losses increased very seriously; and it became clear that the reduction now required must be at least a million tons. The task of selecting commodities for exclusion on this scale was beyond the capacity of the committee, and once more the hope that programmes would be reduced within the limits of transport was deceived.

Shipping in the Third Year.—From the summer of 1916 to that of 1917, the shipping situation was more serious than at any previous period. Its gravity was reflected in the increasing freight rates and shipowners' profits, which had reached their maximum. British time-charter rates rose to 40/- a ton d.w. a mark, and even touched 50/-, as compared with 3/- immediately before the war. In Feb. 1917, the new submarine campaign began and met with immediate success. Within a few months the submarine blockade became a greater danger to the Allies than the surface blockade was to Germany. It was countered partly by the convoy system, which had scarcely however demonstrated its efficacy by the end of this year, and partly by an improved system of organizing shipping.

Throughout the year the control over commodities was developing both in range and in character. To sugar and wheat, which were already controlled by the Sugar and Wheat Commissions, were added all the main articles of food, and the whole was centralized under a newly established Ministry of Food. The Ministry of Munitions extended its effective control over all the raw materials of munitions manufacture and indeed over all metals required for all purposes, over their purchase, their importation, their allotment within the country for every form of manufacture. The War Office developed a similar control over flax, hemp, jute, leather, wool and other materials. The Board of Trade, under somewhat less drastic and more commercial methods, covered the bulk of the remaining imports.

These developments had important consequences on the shipping problem. In the first place, all the imports of the commodities so controlled were Government cargoes, and it was natural that they should be transported in requisitioned tonnage. The War Office could ask the shipping authority to arrange to carry wool or flax (for whatever purpose it might be used) just as it asked for transport of supplies destined direct for the army. But, in the second place, the incorporation within the Government machine of the specialists from the business world who were needed for these intricate and detailed controls, meant that the Government had, for the first time, in its service the advice of experts in the activities affected.

The Ministry of Shipping.—The Coalition Government formed at the end of 1916 established a Ministry of Shipping, under a Shipping Controller, Sir Joseph (now Lord) Maclay who had a seat in the Cabinet, with statutory powers. The Transport Department was absorbed in the new Ministry, while the Shipping Control Committee became an advisory committee to the Controller.

It was shortly afterwards decided to extend requisition at rates based upon blue book terms over all British ships. The comparatively moderate profits on requisitioned ships only made the fantastic profits on free ships more of a public scandal.

Liner Requisition.—A new and ingenious system of liner requisitioning was therefore devised. All liners were formally requisitioned and paid at blue book rates. But the owners continued to run them, taking first any Government supplies, then following any other direction they might receive, and if any space remained, offering freight on the market, the freight, however, being henceforth paid to the Government. The liner cargoes thus became an integral part of the general transport and supply programme, and indeed an increasingly important part of it, amounting at the end to four-fifths of the country's imports.

This new system was devised by a well-known liner owner and was a good instance of the association of the permanent official and the business man.

An Inter-Allied Shipping Committee was created in Jan. 1917. It included representatives of Great Britain, France and Italy. It was unsuccessful. (*See* ALLIED MARITIME TRANSPORT COUNCIL.)

Tonnage Priority Committee.—The second committee, the Tonnage Priority Committee, was of more importance. It was a national Committee, consisting of the actual executive officers from the different departments who were handling the several supply arrangements, and its chairman was the parliamentary secretary of the Ministry of Shipping (Sir Leo Chiozza Money). It met normally once a week throughout 1917 and a part of 1918. It brought those who were making competing, and in their total effect impossible, demands upon the shipping authorities into direct contact with each other and thus facilitated the reduction of their demands.

The new and intensive submarine campaign began in Feb. 1917. It converted the shipping difficulties from a serious inconvenience into a grave menace. The tonnage of the world was

scarcely less at the end of 1916 than in 1913; the tonnage at the disposal of the Allies was not very seriously less.

But this situation was immediately and dramatically altered by the new form of warfare. In the first twelve months 470 ocean-going ships (1,000 if we count all sizes) had been lost. In a single fortnight in April, 122 ocean-going vessels were lost (and all the ocean-going vessels in the world did not exceed 8,000). The continuance of loss at this rate would have brought disaster upon all the Allied campaigns and might well have involved unconditional surrender. At this stage, after much hesitation and conflict of opinion, the convoy system was introduced, and found an immediate success. The actual loss already incurred and the dangers of the future, however, obviously compelled a much more drastic handling of the whole shipping and supply problem. (*See* SHIPPING, WAR LOSSES OF.)

It may be well, at this crucial moment, to attempt a bird's-eye view of the situation from the angle of one responsible for requisitioning and allotting British tonnage. In France, in Belgium, in Salonika, in the Dardanelles, in Palestine, British soldiers were facing the enemy. Their transportation from the United Kingdom, from Australia, from Canada and from India needed about 70 ships. To supply them with food, munitions and clothing; medical attention for invalids and wounded; material for new railways; timber for trenches and huts, meant another 335 ships. Behind them in England, in Canada and in America the raw materials of the industries which made their munitions and their clothes had to be imported (350 ships). At the same time the British Navy had to be supplemented by auxiliaries (100 ships), to be coaled, fuelled and supplied (300 ships). Meantime the Allies had corresponding needs for which their own ships did not suffice (500 ships). And the home population required to be fed and supplied with other necessities of life (750 ships).

The Fourth Year.—By the autumn the situation had become less desperate but more immediately difficult. Two great events had happened. America entered the war. Finance was at once displaced as the governing consideration in the Allies' policy. Henceforward the Alliance as a whole, was practically self-sufficient. It was certain henceforth that money would be available for as many imports as shipping could carry. Shipping became definitely the limiting factor. Nor did America's entry relieve the actual shortage of tonnage. Her potential building capacity gave a different perspective to the future, but it was undeveloped. And her military effort, so vital a factor in the strategical position, necessarily increased the strain on shipping. So rapidly indeed did her military effort develop that it more than absorbed the ships she could put into service in spite of her amazing building achievement. At no time during the rest of the war were there as many American ships in war service as those required to carry her own men and stores. The second great event was the striking and dramatic success of the convoy system. From its first introduction it more than counteracted the effect of the new submarine method; and losses were reduced to less than the rate of 1916. But it could not restore vessels already lost, and new building only gradually overtook current losses. In spite therefore of the much greater hope for the future given by both America's building capacity and the convoy system, the actual disparity between the shipping available and the demands upon it was greater in the autumn of 1917 than it had ever been. 17 million tons deadweight of the world's tonnage had been lost and less than half had been replaced. Great Britain alone had lost 10 million tons, and, even allowing for ships she had bought, built or captured, her net loss was over 4 million tons. France and Italy had lost about 2 million tons and had built practically nothing. Nor had America yet begun to build seriously. At the same time the demands upon shipping were greater than at any previous period. All the distant expeditions (except the long abandoned one to the Dardanelles) were fully maintained. The scale of the war in France was continually increasing. The Navy was at its maximum strength. Serious food troubles were anticipated in Great Britain, France and Italy. The American military effort, with its great demands on transport, was beginning.

By this time, however, the mechanism for securing economical compression of the British supply demands on transport, for selecting only the most essential, for making the utmost use of shipping available was being rapidly perfected. The ultimate needs of scores of millions were sifted through a series of sieves of small and smaller mesh. The big control departments, the Food and Munitions Ministries and the War Office, examined and pruned down the demands of their many branches, with the expert knowledge that had been obtained by the incorporation of numberless experts from the different trades now brought within the area of control. The Ship Licensing Committee was (to some limited extent) pruning off the more obviously useless employment of ships. The Tonnage Priority Committee was examining the demands in more detail and contributing to the same end. Special committees like the Imports Restrictions Committee of January 1917 and the later Cabinet committees of the same year were forcing the departments to make reductions and to impose them on their subordinate organizations. The rationing of neutrals for blockade reasons; the system of prohibition and limited license of certain imports; the diminished purchasing power of most of the world; the pressure on neutral ships by the supply of bunker coal on condition that they should enter employment useful to the Allies—these were all contributing to the same effect—to reduce the excessive demands made on the shipping departments.

And in this national system the final authority now consisted in a Cabinet committee (presided over by Lord Milner) consisting of the Ministers in charge of the great Ministries concerned, on the one hand of Shipping and on the other of the great supply departments particularly the War Office and the Ministries of Munitions and Food, attended by their chief officials.

But by this time the problem was more than national. And the national system required to be supplemented by an international organization which could incorporate the needs of France and Italy and to some extent America, with those of Great Britain and devise a common shipping policy. Controls similar in general character and purpose had been established in France and Italy, but while they remained isolated they afforded no common measure of comparison. There was nothing to show whether the standard of compression imposed in the different commodities was at all equal. A British Cabinet committee could not judge between British and French or Italian needs of sugar or of wheat. Nor could a British Shipping department do so. Obviously the persons best qualified were the sugar and the wheat experts of the different countries. On this principle the Allied system was based. "Programme Committees" were formed of the experts in each main supply (wheat, sugar, meat and fats, oils and seeds, nitrates, hides, wool, flax, hemp and jute, paper, etc.). This was not a system parallel, or conflicting, with the national system; for the officials were the same as those we have seen in the national organization. These committees submitted their demands first severally to Allied Councils of Ministers (food and munitions), and then all together to a supreme Allied shipping authority, formed on the same principle (*see* ALLIED MARITIME TRANSPORT COUNCIL).

Shipbuilding.—Here Great Britain's supremacy before the war was unchallenged. She built some 2 million tons gross a year, twice as much as the rest of the world put together. Claims on men and material however reduced the figure to 660,000 in 1915 and to 630,000 in 1916. By this time, the losses were becoming serious and building looked like falling ever lower. It became necessary for the Government to take vigorous measures. The responsibility was entrusted at different periods to the Admiralty, to the Ministry of Shipping, and to an independent Controller-General. But throughout the last two years of the war a consistent and effective policy was pursued. Better supplies of steel were secured, workmen were withheld, or withdrawn, from the Army. Private yards were specialized and each yard, instead of building several types of vessel, concentrated upon one—twelve types of standard ships being selected and built in considerable numbers. By these means launchings increased to 1,229,000 tons in 1917 and 1,579,000 in 1918. The figure would have been much greater but for the immensely increased work of building and repairing both naval and merchant ships.

But the most notable achievement of shipbuilding during the war was North America's. In 1913, her yards had built only 276,000 tons; and when she declared war she had only 61 yards, with 234 shipways. By the armistice she had 223 yards with 1,099 shipways. By the end of 1918 she was building 3 million tons gross and in 1919 about 4 millions. The rest of the world's building during the war, outside Great Britain and North America, needs little comment. It averaged 600,000 tons a year.

Atlantic Concentration.—Concentration of shipping on the shortest routes was another increasingly important device. We find a great withdrawal of ships from more distant routes and their concentration in the Atlantic. Of a total of 681 British vessels loaded as liners in Oct. 1917 no less than 336 were in the Atlantic (four-fifths of them in the North Atlantic). By Oct. 1918 the proportion had risen even higher, 385 out of a total of 656.

The convoy was introduced in the spring of 1917, and proved an instant and surprising success. Losses which before had averaged over long periods more than 10%, and at times rose to over 20%, of ocean vessels at risk, fell for the subsequent period to the end of the war to less than 1%. The long contest between attack and defence was decided conclusively before the war ended and on its own merits, not as an incidental result of the military successes of the Allies. By the third quarter in 1918 the losses were less than the world's increased building, and by September of that year the world gained even without America's building.

See C. E. Fayle, *Sea-borne Trade and Merchant Shipping in the War* (1920–24); Sir A. Salter, *Allied Shipping Control, an Experiment in International Administration* (1921). (A. Sa.)

WARD, ARTEMUS, the pen-name of Charles Farrar Browne (1834–1867), American humorous writer, who was born in Waterford (Maine), April 26, 1834. He began life as a compositor and became an occasional contributor to the daily and weekly journals. In 1858 he published in the Cleveland *Plain Dealer* the first of the "Artemus Ward" series, which attained great popularity both in America and England. His works include: *Artemus Ward: his Book* (1862); *Artemus Ward: his Travels* (1865); *Artemus Ward in London* (1867); and *Artemus Ward's Lecture* (1869). In 1866 he visited England, where he became exceedingly popular. He died of consumption at Southampton March 6, 1867.

Bibliography.—A good edition of his works was edited with a biographical sketch by M. D. Landon in 1876; *Artemus Ward's Best Stories* (1912) was edited by Clifton Johnson and *Selected Works* (1924) by A. J. Nock. The *Letters of Artemus Ward* were printed in 1900. *See* also E. P. Hingston, *The Genial Showman* (1870), and D. C. Seitz, *Artemus Ward, A Biography and Bibliography* (1919).

WARD, DAME GENEVIEVE (1837–1928) (D.B.E., 1921), English actress, was born in New York on March 27, 1837, and at the age of 18 married Count Constantine de Guerbel. She studied singing in Italy and in Paris, and made her first appearance under the stage name of Ginevra Buerrabella at Bergamo in the opera *Stella di Napoli* (1855). After the loss of her voice in 1862 she taught singing in New York, but in 1873 she came to London and began a long dramatic career, appearing first at Manchester as Lady Macbeth.

She published with Richard Whiting a volume of reminiscences, *Before and Behind the Curtain* (1918).

WARD, JAMES (1843–1925), English psychologist and metaphysician, was born at Hull on Jan. 27, 1843. He was educated at the Liverpool Institute, at Berlin and Göttingen, and at Trinity College, Cambridge; he also worked in the physiological laboratory at Leipzig. He studied originally for the Congregational ministry, and for a year was minister of Emmanuel Church, Cambridge. Subsequently he devoted himself to psychological research, became fellow of his college in 1875 and university professor of mental philosophy in 1897. He was Gifford lecturer at Aberdeen in 1895–97, and at St. Andrews in 1908–10. His work shows the influence of Leibnitz and Lotze, as well as of evolution. His views are further worked out, through criticism of pluralism and as a theistic interpretation of the world, in his Gifford Lectures (*The Realm of Ends*) (1911, 3rd ed. 1920). Ward died on March 4, 1925.

Ward published *Naturalism and Agnosticism* (1899, 3rd ed. 1907); *Heredity and Memory* (1913); *Psychological Principles* (1918, 2nd ed. 1920); *A Study in Kant* (1922); and *Essays in Philosophy* ed. W. R. Sorley and G. F. Stout, with memoir by O. W. Campbell (1927); numerous articles in the *Journal of Physiology*, in *Mind*, and in *The British Journal of Psychology*.

WARD, JOHN QUINCY ADAMS (1830–1910), American sculptor, born in Urbana, Ohio, June 29, 1830. He studied under Henry K. Brown, of New York, in 1850–1857, and by 1861, when he opened a studio in New York, he had executed busts of Joshua R. Giddings, Alexander H. Stephens, and Hannibal Hamlin, prepared the first sketch for the "Indian Hunter," and made studies among the Indians themselves for the work. In 1863 he became a member of the National Academy of Design (New York), and he was its president in 1872–1873. He died in New York on the 1st of May 1910.

WARD, SIR JOSEPH GEORGE, 1st Bart., cr. 1911, (1856–), New Zealand politician, was born at Emerald Hill, Melbourne on April 26, 1856, son of a merchant. At 13 he entered the Post and Telegraph Department. In 1887 he entered parliament as Liberal member for Awarua. Appointed treasurer in the Seddon cabinet of 1893, he was the prime minister's chief lieutenant until Seddon died in 1906, and he then succeeded to the premiership and the leadership of the Liberal party. He pioneered several important reforms, such as loans to settlers, the All-Red cable service, and penny postage for New Zealand.

His ministry was defeated in the February of 1912, but Ward returned to office as minister of finance in the National (War) cabinet of 1915–19. In 1917–18 he was a member of the Imperial war cabinet and in 1919 represented New Zealand at the Peace Conference. In 1919, after representing Awarua continuously since 1887, he lost his seat, and in 1923 he was defeated in a by-election for Tauranga. In 1925 he was elected for Invercargill.

WARD, LESTER FRANK (1841–1913), American geologist and sociologist, was born in Joliet, Ill., on June 18, 1841. He graduated at Columbian (now George Washington) university in 1869 and from the law school in 1871, his education having been delayed by his service in the Union army during the Civil War. In 1865–72 he was employed in the United States Treasury department, and became assistant geologist in 1881 and geologist in 1888 to the U. S. geological survey. In 1884-86 he was professor of botany in Columbian university. He wrote much on palaeobotany, including *A Sketch of Palaeobotany* (1885), *The Geographical Distribution of Fossil Plants* (1888) and *The Status of the Mesozoic Floras of the United States* (1905). His more important works are: *Dynamic Sociology* (1883, 2nd ed. 1897), *Psychic Factors of Civilization* (1897), *Outlines of Sociology* (1898), *Sociology and Economics* (1899), *Pure Sociology* (1903), and with J. Q. Dealy, *Text-Book of Sociology* (1905). He died in Washington, D.C., on April 18, 1913.

WARD, MARY AUGUSTA [Mrs. Humphry Ward] (1851–1920), British novelist, was born on June 11 1851, at Hobart, Tasmania, where her father, Thomas Arnold (1824–1900, *q.v.*), was then an inspector of schools. She was brought up mainly at Oxford, and her early associations with a life of scholarship and religious conflict are deeply marked in her own later literary career. She was brought into close connection during this period with Edward Hartopp Cradock, who was principal of Brasenose college from 1853 till his death in 1886, some of whose characteristics went to the portrait of the "Squire" in *Robert Elsmere*. In 1872 she married Thomas Humphry Ward (1845–1926), then fellow and tutor of Brasenose, and one of the authors of the *Oxford Spectator*.

Mrs. Humphry Ward at first devoted herself to Spanish literature, and contributed articles on Spanish subjects to the *Dictionary of Christian Biography*, edited by Dr. William Smith and Dr. Henry Wace. In 1881 she published her first book, *Milly and Olly*, a child's story illustrated by Lady (then Mrs.) Alma-Tadema. This was followed in 1884 by a more ambitious, though slight, study of modern life, *Miss Bretherton*, the story of an actress. In 1885 Mrs. Ward published an admirable translation of the *Journal* of the Swiss philosopher Amiel, with a critical introduction, which showed her delicate appreciation of the

subtleties of speculative thought. In Feb. 1888 appeared *Robert Elsmere,* a powerful novel, tracing the mental evolution of an English clergyman, of high character and conscience and of intellectual leanings, constrained to surrender his own orthodoxy to the influence of the "higher criticism." The character of Elsmere owed much to reminiscences both of T. H. Green, the philosopher, and of J. R. Green, the historian. The book was reviewed by W. E. Gladstone in the *Nineteenth Century* (May 1888, "Robert Elsmere and the Battle of Belief"), and made its author famous.

Mrs. Ward's next novel, *David Grieve,* was published in 1892. In 1895 appeared the short tragedy, the *Story of Bessie Costrell.* Mrs. Ward's next long novel, *Helbeck of Bannisdale* (1898), treated of the clash between the ascetic ideal of Roman Catholicism and modern life. The element of Catholic and humanistic ideals entered also into *Eleanor* (1900), in which, however, the author relied more on the ordinary arts of the novelist. In *Lady Rose's Daughter* (1903)—dramatized as *Agatha* in 1905—and *The Marriage of William Ashe* (1905), modern tales founded on the stories respectively of Mlle. de Lespinasse and Lady Caroline Lamb, she relied entirely and with success upon social portraiture. Later novels were *Fenwick's Career* (1906), *Diana Mallory* (1908), *Daphne* (1909), *Canadian Born* (1910), *The Case of Richard Meynell* (1911), *Delia Blanchflower* (1915), *The War and Elizabeth* (1918), etc. Mrs. Ward died in London on March 24, 1920.

BIBLIOGRAPHY.—Stephen L. Gwynn, *Mrs. Humphry Ward* (1917); J. Stuart Walters, *Mrs. Humphry Ward; her work and influence* (1922); Janet P. Trevelyan, *The Life of Mrs. Humphry Ward* (1923).

WARD, SETH (1617–1689), bishop, was educated at Sidney Sussex college, Cambridge, where he became a fellow in 1640. In 1643 he was chosen university mathematical lecturer, but he was deprived of his fellowship next year for opposing the Solemn League and Covenant. In 1649 he became Savilian professor of astronomy at Oxford, and gained a high reputation by his theory of planetary motion, propounded in the works entitled *In Ismaelis Bullialdi astronomiae philolaicae fundamenta inquisitio brevis* (Oxford, 1653), and *Astronomia geometrica* (London, 1656). About this time he was engaged in a philosophical controversy with Thomas Hobbes. He was one of the original members of the Royal Society. In 1659 he was appointed master of Trinity college, Oxford, but not having the statutory qualifications he resigned in 1660. Charles II. gave him numerous preferments, and in 1662 he was consecrated bishop of Exeter. He died at Knightsbridge Jan. 6, 1689.

WARD, WILFRID PHILIP (1856–1916), British man of letters, was born at Ware, Hertfordshire, on Jan. 2, 1856, the second son of William George Ward. In 1906 he became editor of *The Dublin Review.* He died in London on April 8, 1916. His works include: *W. G. Ward and the Oxford Movement* (1889); *W. G. Ward and the Catholic Revival* (1893); *Life and Times of Cardinal Wiseman* (1897); *Life of John Henry Cardinal Newman* (1912) and several volumes of essays.

WARD, WILLIAM GEORGE (1812–1882), English Roman Catholic theologian, was born on March 21, 1812. He was educated at Christ Church and Lincoln College, Oxford, and became a fellow of Balliol in 1834. He was attracted to the Tractarians by his hatred of what he called "respectability." He regarded Newman as a mere antiquary. When he was persuaded to hear Newman preach, he at once became a disciple. He took deacon's orders in 1838 and priest's orders in 1840. From that period Ward and his associates worked for union with the Church of Rome, and in 1844 he published his *Ideal of a Christian Church,* in which he openly contended that the only hope for the Church of England lay in submission to the Church of Rome. This publication brought to a height the storm which had long been gathering. The university of Oxford was invited, on Feb. 13, 1845, to condemn "Tract XC.," to censure the *Ideal,* and to degrade Ward from his degrees. The two latter propositions were carried and "Tract XC." only escaped censure by the *non placet* of the proctors, Guillemard and Church. The condemnation precipitated an exodus to Rome. Ward left the Church of England in Sept. 1845, and was followed by many others, including Newman himself. In 1868 he became editor of the *Dublin Review.* He died on July 6, 1882.

See *William George Ward and the Oxford Movement* (1889) and *William George Ward and the Catholic Revival* (1893), both by his son Wilfrid Philip Ward.

WARD, that which guards or watches, and that which is guarded or watched. In architecture the inner courts of a fortified place are called wards, *e.g.,* the upper and lower wards of Windsor Castle (*see* BAILEY, CASTLE). The "ward" in a lock is the ridge of metal which fits exactly into the corresponding "ward" or slot of the key (*see* LOCKS). Boroughs, cities and parishes may be divided into wards, for the conducting of local elections, etc. In the same way, large establishments, such as hospitals, asylums, etc., are divided into wards. In law, "ward" is a term for minors, or persons under guardianship (*see* INFANT, MARRIAGE and ROMAN LAW).

An electoral division in American municipalities is called a ward. Prior to the introduction of the commission and city manager form of government the municipal legislative branch was a city council made up of representatives from the various wards of the city. The wards were supposed to be of about equal population, each ward having either one or two aldermen, chosen by the qualified voters of the ward, in the city council, for terms of one or two years. Many cities are still governed by councils so elected. Each ward is divided into one or more voting precincts or divisions. *See* C. C. Maxey, *An Outline of Municipal Government* (1923).

WAR DEBTS: *see* INTER-ALLIED DEBTS.

WARDEN, a word frequently employed in the ordinary sense of a watchman or guardian, but more usually in England in the sense of a chief or head official. The lords wardens of the marches, for example, were powerful nobles appointed to guard the borders of Scotland and of Wales; they held their lands *per baroniam,* the king's writ not running against them, and they had extensive rights of administrating justice. The chief officer of the ancient stannaries of Cornwall has the title of lord warden (*see* STANNARIES) as has also the governor of Dover castle (*see* CINQUE PORTS).

WAR DEPARTMENT: *see* GOVERNMENT DEPARTMENTS.

WARDHA, a town and district of British India in the Nagpur division of the Central Provinces. They take their name from the Wardha river. The now prosperous town of Wardha was established on a treeless black soil plain at the old village of Palakwari in 1866 at the spot where the branch line to Warora was expected to take off. The population by 1872 had reached 3,560; in 1921 it was 16,044.

The DISTRICT OF WARDHA was carved out of Nagpur in 1862. The population has increased from 355,000 at the census of 1872 to 463,696 in 1921. There are cotton mills at Hinganghat and Pulgaon. The language is Marathi.

WARDLAW, HENRY (d. 1440), son of Sir Andrew Wardlaw, was educated at Oxford and Paris and nominated by the papal court at Avignon bishop of St. Andrews (consecrated 1403). He was tutor to James I., restored the cathedral, and, on the return of James from England, became one of his principal advisers. He persecuted the Wycliffites. Wardlaw issued the charter of foundation of St. Andrews university, the first in Scotland, in 1411. It was confirmed by a bull of Benedict XIII. on Aug. 28, 1413.

WARDROBE, a portable upright cupboard for storing clothes. The earliest wardrobe was a chest, and it was not until some degree of luxury was attained in regal palaces and the castles of powerful nobles that separate accommodation was provided for the sumptuous apparel of the great. The name of wardrobe was then given to a room in which the wall-space was filled with cupboards and lockers. As a "hanging cupboard" it dates back to the early 17th century. For probably 100 years such pieces, massive, but often with well-carved fronts, were made in fair numbers. During the 18th century the tallboy (*q.v.*) was much used for clothes. Towards its end, however, the wardrobe began to develop into its modern form, with a hanging cupboard at each side, a press in the upper part of the central portion and drawers below. As a rule it was of mahogany, but so soon as satinwood

and other finely grained foreign woods began to be obtainable in considerable quantities, many elaborately and even magnificently inlaid wardrobes were made. The central doors, which had hitherto enclosed merely the upper part, were carried to the floor and were fitted with mirrors.

WARDROBES, THE. Although originally *garderoba* (wardrobe) and *camera* (bedroom) were synonymous, *garderoba* was early distinguished as the small room attached to the bedchamber, where clothes were kept and articles of value stored. Mediaeval kings and emperors, magnates of church and State, all had a wardrobe as well as a bedroom. But no Continental *vestiarium* (wardrobe) experienced such development as that through which the *garderoba* of the kings of England passed. From a place of deposit, a mere adjunct of the king's chamber (*q.v.*), the king's wardrobe in England grew into a third treasury, and, in the 13th century, dispossessing the chamber as the financial and directive agent of the royal household (*q.v.*), became a full administrative department. Not even the wardrobe of the popes, which enjoyed some measure of authority between the 6th and the 11th centuries, can compare with it, while the wardrobe of the kings of France was always a subordinate branch of the chamber, never a separate institution.

The increasing administrative burden of the chamber, relieved only partially by the growth and independent establishment of the exchequer (*q.v.*), imposed further duties upon the *garderoba regis* (king's wardrobe). So ably did it discharge them that, by the end of John's reign, it had developed into a rudimentary office, and before long took over from the chamber the routine work of the household. A clerical keeper or treasurer, and a lay steward, were responsible for its management, their revenue mainly coming from the exchequer, to which the keeper accounted. His statements were attested by the controller, his immediate subordinate, also a clerk, who kept a counter-roll of receipts and expenses. Under Edward I. the controller became the recognized keeper of the privy seal (*see* SEALS), and the cofferer who was the third clerical officer, obtained definite title and position. Beginning as the personal clerk of the keeper, he rose to be chief bookkeeper and cashier, and the usual *locum tenens* of the keeper. By the close of the 13th century, because public matters claimed more and more of the attention of the chancery (*q.v.*), the wardrobe had become the household secretariat; the domestic chancery as well as the domestic exchequer. Nor did it fulfil only domestic and peaceful functions. As the household was the nucleus of the army when the king waged war in person, the wardrobe not unnaturally then undertook the financial administration of the campaigns. The finances of most of Edward I.'s expeditions, of the Scottish offensives of Edward II. and Edward III., and of a number of the campaigns of the Hundred Years' War, were administered in this way. Thus the king's wardrobe, or wardrobe of the household, came to have a wider military and a political importance. The reason lay in its all-round usefulness. Its machinery was adaptable, and its officers, appointed by word of mouth, were directly answerable to the king. Its funds could be augmented or diminished at need, and, although its accounts had to be submitted to the exchequer for audit, it actually spent the money. It also had the use of a seal which, though in the first instance personal to the sovereign, could be and was increasingly employed in State business. These and similar considerations commended the wardrobe to king, aristocracy and ministers alike. Yet the jealous and vigilant barons did not hesitate to attack the wardrobe whenever they felt it was being used as an instrument of prerogative. In the latter part of the reign of Edward I. and again under Edward II., they persistently tried to curtail its activities. It was, for example, a result of the baronial ordinances of 1311, that in 1312 the privy seal was taken away from the controller and given a keeper all to itself. The exchequer equally resented wardrobe encroachments, and its ordinances of 1323–26 were almost as much concerned with defining relations with the wardrobe as with improving internal economy.

The Great Wardrobe.—Differentiation and centralization were as ceaselessly at work within the wardrobe as without. Since both chamber and wardrobe accompanied the household wherever it went, they needed places in which to store their heavier and bulkier commodities. Rooms in the king's manors were set apart for this purpose, the wardrobe being held responsible for the custody and replenishment of the stocks kept in them. A sub-department, the great wardrobe, *magna garderoba regis,* a term in use by 1253, constituted itself to direct the necessary labour. The description "great" referred to the size and quantity of the goods stored, not to the status of the office, which was inferior to the king's wardrobe. The clerk of the great wardrobe was its head, and to begin with, all its officials, excluding the two or three stationed with the more important stores, followed the court. Up to 1324 the clerk was financed by the wardrobe, but from that year he received his revenue from, and accounted to, the exchequer, except for a brief return to former usage between 1351 and 1360. Owing to the nature and variety of the work, it was practically impossible for the clerk or his assistants to reside continually in the household. The great wardrobe was not simply a depository. Besides collecting, safeguarding and distributing goods, it also manufactured and repaired them. Cloth was made into clothes, metal was wrought into armour and weapons, guns and cannon were cast and assembled, and sulphur, saltpetre and other ingredients were combined into gunpowder.

The Tower of London was its first centre, but from the beginning of the 14th century, houses in the city of London were also used. Among them was a house in Bassishaw (Basinghall) ward, near the weekly cloth markets of Weavers' Hall and Bakewell Hall, and the house in Lombard street which had once belonged to the Bardi merchants. Larger and better quarters were bought in 1361, in the parish of St. Andrew's by Baynard's Castle. Here the office and its staff lived until the Great Fire of 1666. They then found accommodation in Buckingham street in the Savoy, but later removed to Great Queen street.

Hardly had the great wardrobe taken shape before the privy wardrobe, *priuata garderoba regis,* made its appearance as a travelling store for chamber, wardrobe and great wardrobe. There had early been in the household a small wardrobe of robes and arms for current use, but only towards the end of the 13th century did it develop even a modest organization. Its officers were as much chamber as wardrobe servants, and such money as they needed was supplied by the wardrobe or the great wardrobe. Although their work was the care and transport of articles wanted from day to day, they soon found it advisable to have a central depository. Between 1323 and 1344 they set up a store in the Tower of London, chiefly of arms and armour. This, used by chamber and great wardrobe as well as by the household, came to be known as the privy wardrobe in the Tower. The keepers of this wardrobe, also clerks of the chamber until 1356, took their revenue from the exchequer, which also audited their accounts. Before 1360 it had separated itself from the household though it left behind a small privy wardrobe, which survived well into the 16th century, to carry on its original work. By 1399 it was as independent of great wardrobe and chamber as it was of the household. It was looted by the revolted peasants in 1381.

In consequence of both internal and external differentiation, and with the adoption of special means for financing war, under parliamentary control the king's wardrobe, from the latter part of the 14th century generally described as "the household," slowly degenerated into a simple office of household accounts. The process was not materially hindered even when the treasurer of war was the treasurer of the household. The privy wardrobe in the Tower lost both name and identity in the 15th century with its transformation into the king's armouries in the Tower. But the great wardrobe, still the storehouse for the household, came to be known as "the wardrobe." The cofferer of the household and the officers of the great wardrobe were suppressed in 1782 by Burke's act for economical reform. Such of their duties as were retained were divided among the lord chamberlain (*q.v.*), the lord steward (*q.v.*), and the surveyor of the buildings.

WARD ROOM: *see* NAUTICAL TERMS.

WARE, a town of Hertfordshire, England, on the Lea. Pop. (1921) 5,949. The church of St. Mary is a cruciform Decorated and Perpendicular building of flint and stone, the tower dating from Edward III. The famous "Great Bed of Ware," referred to in Shakespeare's *Twelfth Night,* which formerly was at the Saracen's Head in Ware, has been removed to Rye House, 2 m. distant, the scene of the Rye House plot of 1683 against Charles II. The town possesses breweries and brick-fields.

WARE, a town of Hampshire county, Massachusetts. Pop. (1920) 8,525 (30% foreign-born white). Its manufactures include cotton and woollen goods, sport shoes and coated paper. In 1761 Ware-River parish (comprising parts of Brookfield, Palmer and Western) was established as the district of Ware, which in 1775 was made a town by general act.

WAREHAM, a town of Dorsetshire, England. Its population in 1921 was 1,993.

Owing to its situation as a key of Purbeck, the site of Wareham (*Werham, Warham*) has been occupied from very early times. There are still remains of earthworks around the town which are probably of Romano-British age originally and modified on many subsequent occasions. Wareham's British name was *Durngueir.* The early chroniclers declare that St. Aldhelm founded a church near by about 701, and perhaps the priory, which is mentioned as existing in 876, when the Danes retired from Cambridge to a strong position in this fort. Their occupation was not lengthy. Having made terms with Alfred, they broke the conditions and returned to Cambridge. In the following year they were again at Wareham, which they made their headquarters. Beorhtric was buried here. Further incursions made by the Danes in 998 and in 1015 under Canute probably resulted in the destruction of the priory, on the site of which a later house was founded in the 12th century as a cell of the Norman abbey of Lysa, and in the decayed condition of Wareham in 1086. The early castle, which existed before 1086, was important during the civil wars of Stephen's reign. John fortified it against Louis of France in 1216, and during the civil wars of the 17th century it was the scene of much fighting. Wareham was accounted a borough in Domesday. In 1587 Elizabeth granted certain privileges to Wareham, but it was not incorporated until 1703. There are three ancient churches, and the ruins of a priory dedicated to SS. Mary, Peter and Ethelwood.

WAREHAM, a town of Massachusetts. The resident population was 5,594 in 1925 (State census) and there is a summer population of 15,000. It is an important shipping point for cranberries, oysters, clams, scallops and garden truck, and has a horseshoe factory and other manufacturing plants. The town was formed in 1739 from part of Rochester and a plantation of Plymouth called the Agawam Purchase.

WARENNE, EARLS. The Warennes derived their surname from the river of Guarenne or Varenne and the little town of the same name near Arques in Normandy. William de Warenne, who crossed with William I. in 1066, was a distant cousin of the Conqueror, his grandmother having been the sister of Gunnora, wife of Richard I. of Normandy. De Warenne received as his share of English spoil some 300 manors in Yorkshire, Norfolk, Surrey and Sussex, including Lewes Castle. He was wounded at the siege of Pevensey and died in 1089, a year after he had received the title of earl of Surrey. Both he and his successors were more commonly styled Earl Warenne than earl of Surrey.

His son William, 2nd earl (*c.* 1071–1138), was a suitor for the hand of Matilda of Scotland, afterwards queen of Henry I. He was temporarily deprived of his earldom in 1101 for his support of Robert, duke of Normandy, but he commanded at the battle of Tenchebrai (1106), and was governor of Rouen in 1135.

William de Warenne, 3rd earl (d. 1148), was, with his half-brother, Robert de Beaumont, earl of Leicester, present at the battle of Lincoln, where his flight early in the day contributed to Stephen's defeat. He remained faithful to the queen during Stephen's imprisonment, and in 1146 he took the cross, and was killed near Laodicea in January 1148.

His daughter and heiress, Isabel, married in 1153 William de Blois, second son of King Stephen and Matilda of Boulogne, and in 1163 Hamelin Plantagenet, natural son of Geoffrey, count of Anjou. Both Isabel's husbands appear to have borne the title of Earl Warenne. Earl Hamelin was one of those who at the council of Northampton denounced Becket as a traitor; he remained faithful to his half-brother, Henry II., during the trouble with the king's sons, and in Richard I.'s absence on the crusade he supported the government against the intrigues of Prince John.

William de Warenne (d. 1240), son of Isabel and Hamelin, who succeeded to the earldom in 1202, enjoyed the special confidence of King John. In 1212, when a general rebellion was apprehended, John committed to him the custody of the northern shires; and he remained faithful to his master throughout the troubles which preceded the signing of the Charter. In 1216, as the king's situation became desperate, the earl repented of his loyalty, and, shortly before the death of John, made terms with Prince Louis. He returned, however, to his lawful allegiance immediately upon the accession of Henry III., and was, during his minority, a loyal supporter of the crown. He disliked, however, the royal favourites who came into power after 1227, and used his influence to protect Hubert de Burgh when the latter had been removed from office by their efforts (1232). Warenne's relations with the king became strained in course of time. In 1238 he was evidently regarded as a leader of the baronial opposition, for the great council appointed him as one of the treasurers who were to prevent the king from squandering the subsidy voted in that year. His son John de Warenne (*c.* 1231–1304) succeeded in 1240, and at a later date bore the style of earl of Surrey and Sussex. In the battle of Lewes (1264) he fought under Prince Edward, and on the defeat of the royal army fled with the queen to France. His estates were confiscated but were subsequently restored. He served in Edward I.'s Welsh campaigns, and took a still more prominent part in Scottish affairs, being the king's lieutenant in Scotland in 1296–1297. In September 1297 he advanced to Stirling, and, giving way to the clamour of his soldiers, was defeated by William Wallace on the 11th. He invaded Scotland early the next year with a fresh army, and joining Edward in the second expedition of that year, commanded the rear at Falkirk.

John de Warenne (1286–1347) succeeded his grandfather in 1304, and was knighted along with the prince of Wales in 1306 two days after his marriage with the prince's niece, Joanna daughter of Eleanor of England, countess of Bar. From that time onwards he was much engaged in the Scottish wars, in which he had a personal interest, since John Baliol was his cousin and at one time his ward. As there were no children of his marriage, his nephew, Richard Fitzalan II., earl of Arundel (*c.* 1307–1376), became heir to his estates and the earldom of Surrey. His northern estates reverted to the crown, and the southern estates held by Joanna of Bar during her lifetime passed to Fitzalan. The Warrens of Poynton, barons of Stockport, descended from one of Earl Warenne's illegitimate sons by Isabella de Holland.

See G. E. C(okayne), *Complete Peerage,* vol. vii. (1896); and John Watson, *Memoirs of the Ancient Earls of Warren or Surrey* (2 vols., Warrington, 1782).

WAR FINANCE (COST OF THE WORLD WAR). Estimates of the direct cost of the World War, 1914–18, vary greatly and even ten years after the conclusion of the armistice it is impossible to give precise figures. The reason of this lies in the difficulty of clearly determining what part of the national outlays during the war period can be strictly regarded as war expenditure, while there is also difficulty in determining the net, as distinct from the gross, cost. Much of the war expenditure of the various countries constituted in some respects a source of fresh income, and, while national treasuries were heavy losers by war outlays for goods and materials at fabulous war prices, individual nationals made large fortunes, which in due course furnished fresh resources of national wealth for use after the war. The difficulty of determining precise figures is also increased by the task of deciding when war expenditure really terminated. In most cases, increased expenditure from the national exchequers, resulting directly or indirectly from the war, went on for some time after the armistice, in 1918, and it was only some few

years later that anything in the way of statistics was prepared giving the cost of the war, although all kinds of hurried estimates were made during its progress. Thus, in Nov. 1917, the Mechanics and Metals National Bank of the State of New York prepared a statement estimating that at that time the money expended was more than $100,000,000,000, or about £20,000,000,000, the further estimate being made that the expenditure was at the rate of $5,000,000,000 each month, so that, inasmuch as the war persisted for another year, another $60,000,000,000, or £12,000,000,000, would have to be added. In 1924, however, some six years after the war, an exhaustive enquiry into the cost was made by Harvey E. Fisk, of the Bankers' Trust company, in New York, and, according to that authority, the total cost of the war was placed at $80,680,000,000 gold, or about £16,000,000,000. That statement, however, was reached on the basis of endeavouring to calculate the cost of the war on the price-level basis, the inflated currencies which characterized the war years, and especially the latter periods, being adjusted to terms of 1913 prices, which the authority quoted described as "the gold cost of the war."

Bankers' Trust Company Estimate.—Inasmuch, however, as not all the countries formally de-valued their currencies after the war, and while Great Britain, although experiencing, in common with other nations, a decline in commodity prices, preserved intact the exchange value of the £, it is perhaps simpler and more illuminating to give the following estimates, which were put forward in 1924 by the Bankers' Trust company of New York, where the cost to the various nations is set out in sterling, without the further calculations based on an adjustment of price-levels. These figures, as briefly summarized in *Whitaker's Almanack for 1928*, are as follows:

Nation	*Total Expenditure* £
British Empire	13,577,900,000
Great Britain	11,076,000,000
Canada-Newfoundland	762,700,000
Australia	476,700,000
New Zealand	234,400,000
South Africa	159,000,000
India	687,100,000
Other Parts	182,000,000
Belgium	411,800,000
France	7,962,200,000
Greece	115,100,000
Italy	4,432,700,000
Japan	419,100,000
Portugal	235,300,000
Rumania	308,800,000
Russia	5,312,700,000
Serbia	119,000,000
United States	7,500,000,000
Total, Allies	£40,363,600,000
Austria-Hungary	4,068,400,000
Bulgaria	261,000,000
Germany	10,341,100,000
Turkey	451,800,000
Total, Central Powers	£15,122,300,000
Grand Total	£55,486,000,000

The Basis of Calculation.—A striking example of the discrepancies in calculations is afforded by the answer given by the British chancellor of the exchequer to a question in the House of Commons in May 1919, regarding the cost of the war to Great Britain. Sir (then Mr.) Austen Chamberlain said that up to March 31, 1919, the net cost might be estimated, in round figures, at £6,700,000,000. It will be observed, however, that in the table the figure is given as £11,076,000,000. Not only, however, did the chancellor of the exchequer's statement exclude all debts due from dominions and allies, but it is impossible to follow the allowance made for "normal peace expenditure." Broadly speaking, the basis of calculation in the case of the foregoing figures may be said to be (*a*) a calculation based upon the excess of expenditure over the normal figures of the year previous to the war, while the period taken is not 1914–18 but 1914–20, inclusive, war expenditure extending certainly to that date and possibly longer. Thus, in the case of Great Britain alone, expenditure totalled (for one year) £1,666,000,000 more than a year after the war and was over £1,000,000,000 two years after the war. In certain respects, of course, such, for example, as war pensions, war expenditure is still going on, but no attempt has been made to carry the calculation beyond 1920. Nor, as already stated, do the calculations attempt to follow out the American process adopted by the Bankers Trust company of adjusting the currency cost of the war to 1913 levels, although, of course, the point is important. The Bankers' Trust divided the figures for each year by the average wholesale price index number for the year, thus putting the statistics for each country on the 1913 price basis. The adjusted cost figures were then converted into dollars at par of exchange, and on that basis the real cost of the war in 1913 dollars is estimated at 80,681,000,000 dollars, or in sterling a little more than £16,000,000,000, which, of course, is a very different figure to the actual gross currency costs recorded in the foregoing table.

The total expenditure in the case of most of the countries enumerated in the table can be regarded as the outside amount, but the two notable instances where the net cost might be reduced if allowance were made for loans to allies, are the British empire and the United States. British loans are over £100,000,000 to dominions and colonies, while at March 31, 1928, loans due to Great Britain included £706,000,000 from France, £266,000,000 from Italy, £100,000,000 from various smaller European States, and £887,000,000 from Russia, the last item, however, being regarded somewhat in the light of a bad debt.

Indirect Cost of the War.—At this point statistics break down. With the exception, perhaps, of the United States, it may fairly be said that the figures already given do not begin to express the real cost of the war. Great Britain alone sustained 676,442 actual fatalities, with 1,648,014 wounded, while French fatalities totalled 1,400,000 killed, 800,000 maimed, and 3,000,000 wounded. Previous to 1914 Great Britain, by reason of her seniority among the big nations resulting in an accumulation of savings and a prestige in the matter of manufacturing, had the leading place among the nations in financial lending power and control over the exchanges, conditions in their turn contributing to her power as the leading monetary centre of the world. As a consequence of the war, or, rather, as a consequence of the three years of neutrality on the part of the United States during the war, the equipoise of the balance of trade was completely destroyed, and at the end of the conflagration the belligerent countries of Europe became debtors to the United States, first, on account of the colossal trade balance in favour of America, and, second, because of the actual debts incurred by the belligerent nations to the United States Government. All this, so far as Europe is concerned, has to be reckoned amongst the indirect costs of the war, and to express that cost in figures is impossible. Whether, on the other hand, an equivalent of the unknown amount to be debited to the belligerent countries of Europe is to be credited to the United States is not only debatable but a controversial subject, because economists in the United States of America often plead that, as a matter of fact, economic progress in their country was retarded rather than helped by the four years' war.

It may be mentioned that in a lecture delivered before the London Institute of Bankers in June 1920 by Edgar Crammond on "The Real Cost of the War," an attempt was made by that statistician to appraise the real net cost of the war after making all allowances for revenues or territories gained or lost. The result was, naturally, to reduce materially the gross cost. Thus he estimated the net *real* cost of the war to Great Britain at only £3,500,000,000; France at £5,400,000,000; Italy at £2,100,000,000; and so on while for the five years ended 1919 the United States was reckoned to have gained materially in wealth.

Cost of the War to the United States.—More than in the case of any other country, big deductions have to be made in the case of the United States from the gross amount of war expenditure. According to the calculations of the Bankers' Trust company in 1924, the total cost of the war in currency dollars was about $37,500,000,000, or about £7,500,000,000. From that total, however, has obviously to be deducted about $10,000,000,000 or £2,000,000,000, on account of loans to the Allies, while, although

Debts of the Allied and Associated States to the United States as of October 31, 1927

*The United States Government holds Bonds of the Debtor Governments in respect of the sums shown in these columns; the amounts stated are exclusive of interest accrued and unpaid. †A funding agreement has been signed but has not yet been ratified. **An agreement between the respective Governments as to this debt was reached in Dec. 1927. §American Relief Administration only.

the point is challenged by many American economists, it would seem that just as to the direct ascertained cost of the war to the European belligerents has to be added a large but unknown total representing indirect cost, so in the case of the United States the argument is of the reverse order. The United States as well as the Allies suffered loss through war casualties and also through war inflation. Nevertheless, just as the cost of the war was increased to the European belligerents by the high prices paid for foodstuffs and war materials, so the United States was the gainer by these same prices. Of still greater moment, however, was the fact that just as the European belligerents lost markets and economic strength by the war, so the United States, by reason of her three years of neutrality, gained in both of these respects. More, however, than any other country, with the exception of Japan, the United States met its war expenditure through taxation, though, equally, and because of its financing of the requirements of the Allies, no country issued within a brief space of time a larger amount in loans, something like $23,000,000,000 being raised after the entry into the war. As the last entrant, however, the United States benefited greatly by the experience gained from the mistakes of other countries, and while a certain measure of inflation was the inevitable accompaniment of such huge and sudden borrowing, economy and sufficient taxation were the watchwords from the moment of America taking a hand in the conflict, and a continuance of that policy has resulted in a greater amount of debt liquidation since the war than any other country has been able to achieve. The above table, taken from *The Stock Exchange Official Intelligence for 1927*, sets out the debts of the Allied and Associated States to the United States of America as of Oct. 31, 1927, the figures being as shown by the *Statement of the Public Debt of the United States* issued by the office of the secretary to the United States Treasury.

How War Expenditure Was Met.—Subject to the difficulties of calculations and estimates already referred to, the statistics prepared by the Bankers' Trust showed that on the basis of currency, not of 1913 values, the entire war expenditure was met as to about 69% in borrowings at home in one form and another, as to a further 10% in loans from Allies, and as to about 1% in loans from foreign neutral countries, the balance being obtained from taxation. In the case of the Continental Central Powers, however, the percentage of borrowing was greater than in the case of Great Britain or the United States. In fact, apart from Japan, the only Governments which had the courage to ask their nationals to pay very heavy taxes during the greater part of the war period were Great Britain and the United States. Even in Great Britain there was a curious reluctance to impose taxation during the earlier stages of the war, the idea apparently prevailing in all countries that the war must be made popular at all costs. In Great Britain, indeed, there was the curious experience of the people actually inviting an increase in taxation, deputations waiting upon the chancellor of the exchequer at quite an early stage of the war requesting that there should be an increase in direct and indirect taxation. Throughout the whole period of six years covered by the calculations concerning the cost of the war, Great Britain was the most heavily taxed country, although she was also during the war itself the largest borrower, having to finance the greater part of the conflict on behalf of herself and her Allies. At one time, the income tax of Great Britain rose to 6s. in the £, while a prolific source of revenue to the exchequer during the war period was the excess profits duty, a tax which was levied from 50 up to 80% on all business profits exceeding the pre-war level. Some idea of the exacting nature of the tax, and incidentally of the profiteering which went on during the war, may be gathered from the fact that from this source alone the British Treasury received within a period of five years no less than well over £1,000,000,000. Indeed, the tax may be said to have yielded not far short of 25% of the total war revenue from taxation. Nevertheless, it is generally believed to have brought some evil consequences in its trail and was among the influences leading to demands for higher wages and to inflation both in credit and in currency. From the outset Great Britain was fortunate in possessing in her income, super tax and death duties, a machine ready to hand which greatly aided the immediate application of war taxation, so that in addition to the revenue from excess profits tax, income and super tax, which had yielded about £47,000,000 in the pre-war year, rose in 1917 to £250,000,000, in 1918 to £291,000,000, in 1919 to £359,000,000, and in the following year to £394,000,000. In Great Britain, however, as in other countries, a large percentage of the war expenditure was met by loans, and at the outset the borrowing method was practically universal with all the belligerent countries. Moreover, as was natural, the first step taken in most of the belligerent countries was in the direction of short-term Treasury bills. In Great Britain these bills, which, beginning in small amounts, rose at one time to over £1,200,000,000, were placed in the London money market with the banks and discount houses through a system of tendering, thus to some extent minimising their inflationary effect, but in other countries the usual procedure was for the bills to be taken by the national or central banks and either held by them or placed gradually in other quarters. In many cases these bills were converted later

into short-term bonds, but the war was not far advanced before long-dated borrowing became necessary, one of the first instances being the flotation in Great Britain in Nov. 1914, of a 15-year loan for £350,000,000 in 3½ per cents at 95. In spite of the stern necessities of the case, the loan was not too well applied for, a part being taken temporarily by the Bank of England, thus involving at the outset a further stimulus to inflation. At the time of the flotation, the loan was the largest ever offered at one time, but it was destined to appear almost a small operation compared with some which followed, the climax being reached in 1917, when, including conversions effected at the same time, the total amount issued was no less than £2,000,000,000. Altogether the extent of Britain's war borrowings may best be expressed by saying that the total amount of funded and unfunded debt, which previous to the war totalled about £650,000,000, had risen by the end of 1920 to £7,830,000,000. To quote figures after that date would be misleading because debt conversions were often carried through on lines involving a saving in the service on the debt but an increase in deadweight debt owing to the loans being issued at a material discount. In considering Great Britain's methods of payment for the war, it must also be mentioned that contemporaneously with the immediate issue of Treasury bills after the commencement of the conflict, currency or Treasury notes were authorized for £1 and 10s. and these notes at one time attained a maximum circulation of over £300,000,000. As against the notes, however, British Treasury bills were issued and must be reckoned amongst the high total attained by those bills.

In considering the payment by the belligerent countries for the war, concealed taxation through the effect of inflation upon prices has to be remembered. It was in the Continental countries that the full effect of inflation, resulting from excessive borrowing and insufficient direct taxation, was most strikingly revealed. Therefore, it is far more difficult in the case of the Continental and Central Powers to assess in terms of currency the cost of the war than in the case of Great Britain and the United States. In most instances, however, the greatest depreciation in currencies occurred after the war was concluded. In Germany this was due to the fact that fully 90% of the war expenditure was met by internal borrowing, Austria also raising about 87% of its war expenditure in loans either at home or from Allies. In France over 76% of the expenditure was raised in loans at home, with fully 17% in loans from Allies and foreign countries, but chiefly from Allies. In the case of France, war expenditure was naturally prolonged for a considerable period after peace owing to the rebuilding of devastated areas, and although Germany was not in a similar position, her supplies of foodstuffs, raw materials, manufactured goods and machinery were so exhausted that heavy borrowings were necessary to meet the situation.

Speaking broadly, and taking for the most part, the calculations of the Bankers' Trust company of New York, Belgium raised practically the whole of her war expenditure in loans from Allies, Italy raised about 51% of the costs in loans at home and 21% in loans from Allies, while Portugal and Russia raised about 75% and 95% respectively in loans.

External Borrowings by the Belligerents.—No feature of war expenditure was more remarkable than the difficulty experienced by the belligerent countries in Europe during the first three years of the war in making payments for goods and services to the United States and other neutral countries. The problem was one of exchange, and no description of the methods of paying for the costs of the war would be complete without a reference to this particular aspect of war finance. In the paragraph dealing with the cost of the war to the United States a table is given showing the indebtedness of various belligerent countries to the United States Government and the United States nationals. It is the origin of those loans which, in the main, may be regarded as one of the concrete expressions of this special difficulty. In the first three years of the war Great Britain and other belligerent countries were largely dependent upon the United States and other neutral countries for foodstuffs and for war materials. Owing to the effectiveness of the naval blockade by Great Britain some of these countries were virtually cut off from outside supplies. The problem of the countries purchasing from abroad, however, was that of making payments in the currencies of the supplying countries. The greater part of the strain—especially during the period of the war—fell upon Great Britain, which was financing its own necessities and a large part of those of its Allies. Out of its own resources, which were supplemented later by amounts taken from the central banks of France and Russia, many millions of gold were shipped from London to the United States to save the strain on the exchange. In spite of such shipments, however, the greatest difficulty was experienced in preventing the American exchange on London from collapsing altogether. At that time the nationals of Great Britain were the holders of about £1,000,000,000 in American securities of various kinds and the greater part of these securities were finally commandeered at the price of the day by the British Government, which then made arrangements with Morgans in New York for the marketing of the securities and for the fixing of the exchange on London. That is to say, the securities were supplied with sufficient rapidity to ensure the necessary amount of dollars being in the hands of Morgans to maintain the exchange. In addition, loans to the extent of at least £200,000,000 for Great Britain and one or more loans for Great Britain and France jointly were placed with American nationals. This was before the entry of the United States into the war. After that date, which was in April 1917, the financing of the requirements of the Allies in the United States was arranged on wholly different lines. America came into the war just when, in spite of the methods described, the sterling exchange appeared again to be on the eve of breaking down. Under the new system, however, the U.S. Government gave dollar credits to the Allies for all goods and services supplied in the United States, and that process went on not only during the war but for some time afterwards when the exchanges were still maintained by America continuing to finance the post-war requirements of the Allies and of France, in particular, by the credits referred to. The net result of these loans is shown in the table giving the debts of the Allied and Associated States to the United States. Thus, in the case of Great Britain, it will be seen that in addition to parting with some hundreds of millions of pounds in gold to meet war expenditure for goods and services supplied from that country, she also remitted nearly £1,000,000,000 of her holding of American railroad securities and incurred a debt of nearly the same amount.

WAR GRAVES. With a view to ensuring the care and permanence of the graves of British soldiers buried in France negotiations took place early in the war between the British military authorities responsible for the marking and registration of the graves and the French Government. On Dec. 29, 1915, the latter passed a law which provided that all Allied graveyards on the soil of France should be acquired by the Government of the republic at its own expense, and that the rights of ownership should be enjoyed in perpetuity by the Allied nations concerned[1].

Under this enactment it was possible for an *association régulièrement constituée* by an Allied Government to be entrusted with the care of its graves in France. The result was the establishment in Great Britain (Jan. 1916) of a National Committee for the Care of Soldiers' Graves, the presidency of which was accepted by the Prince of Wales.

As the fighting extended it became evident that the care of the graves after the war and the erection of permanent memorials would be a task too extensive for a body with the limitations of the national committee to undertake. Among these limitations was the lack of direct representation of the dominions and other parts of the Empire, whose soldiers were falling and being buried side by side with those of the United Kingdom. In a memorandum addressed to the prime minister, dated March 15, 1917, the prince

[1]Later on, the governments of Belgium, Italy, Greece, Egypt and Palestine followed the lead of France by passing equally generous measures.

of Wales, as president of the national committee, suggested that the formation of "a joint committee of the governments of the Empire, or a statutory body of commissioners somewhat on the lines of the development commission," should be proposed to the forthcoming Imperial conference. The question was accordingly laid before the conference on April 13, 1917, when a resolution was passed praying his majesty to grant a royal charter for the constitution of an Imperial War Graves Commission, which should be empowered to care for and maintain the graves of those fallen in the war, to acquire land for the purpose of cemeteries and to erect permanent memorials in the cemeteries and elsewhere. The charter was passed under the great seal of May 21, 1917, and the commission, of which the prince of Wales became president, was established. Maj.-Gen. Sir Fabian Ware, who had been in command of the military organization in the field since 1915, was appointed permanent vice-chairman.

Constitution of the Commission.—The members of the commission are the secretary of State for war (ex-officio chairman), the secretary of State for the colonies, the secretary of State for India, the first commissioner of works and the representatives of Canada, Australia, New Zealand, South Africa and Newfoundland. The charter further provides for eight non-official members appointed from time to time by the Sovereign. In 1928 the non-official members were: Mr. Harry Gosling, Mr. Rudyard Kipling, Lt.-Gen. Sir George Macdonogh, Admiral Sir Morgan Singer, Sir Henry Maddocks, Gen. Sir Walter Braithwaite, Capt. Lord Stanley and Maj. Gen. Sir Fabian Ware.

The commission's deliberations during their first year resulted in the double proposal laid before the next Imperial conference on June 17, 1918, that £10 per grave should be taken as the probable cost of the construction of cemeteries, and that the cost of carrying out the decisions of the commission should be borne by the respective governments in proportion to the numbers of the graves of their dead. Estimates are presented yearly to each of the participating governments, the respective parliaments being asked to vote a proportion of the total in accordance with the decision of the Imperial conference of 1918 referred to above. The commission administers the grants in aid thus received through a finance committee, which meets regularly at short intervals and which is attended by a representative of the Treasury of the United Kingdom to advise and assist. The principle of complete co-operation runs through all the work of the commission, the participating governments being represented in the administrative personnel, both in London and abroad, as far as is practicable, on the same proportional basis as has been adopted for the sharing of expenditure.

Policy.—One of the first acts of the commission was to lay down as a guiding principle that the graves of all ranks should be treated on a basis of absolute equality. With this principle as a foundation, the commission, desiring to have an impartial opinion, invited Sir Frederick Kenyon, director of the British Museum, to consult representatives of the army, religious bodies and others interested and to report as to how the commission could discharge their responsibilities with the greatest satisfaction to all concerned. His recommendations, which were adopted by the commission, were briefly as follows: (1) The erection of uniform headstones over all war graves. (2) The erection of two central monuments in each cemetery where possible.

The principal architects entrusted with the preparation of designs were Sir Edwin Lutyens, Sir Reginald Blomfield, Mr. Herbert Baker, Sir Robert Lorimer, Sir John Burnet, Mr. Charles Holden and Mr. Edward Warren. The headstones are 2ft. 8in. in height, 1ft. 3in. in breadth and 3in. in thickness. Each stone bears at the top the badge of the regiment or unit. Then follow the military details with the name of the deceased and the date of his death, below which is carved the symbol of his faith, while at the foot of the stone is engraved a personal inscription chosen by the next-of-kin. Of the two central monuments the great altar-like stone of remembrance, designed by Sir Edwin Lutyens, bears the inscription chosen by Rudyard Kipling, "Their name liveth for evermore." The other memorial is the great cross of sacrifice designed by Sir Reginald Blomfield, to the shaft of which is fixed a crusader's sword of bronze.

In addition to the marking and care of the graves, the commission was entrusted with the erection of memorials to record the names—more than 300,000 in number—of those sailors and soldiers who have no known graves. Several memorials of this nature are completed, including the three connected with the Navy, which stand on prominent sites at Portsmouth, Chatham and Plymouth, the three ports intimately connected throughout Britain's naval history with the sea service; the Gallipoli memorial at Cape Helles; the Salonika memorial at Lake Doiran; the memorial at Jerusalem in Palestine; the Indian memorials at Neuve Chapelle in France and at Port Tewfik on the Suez Canal; and the Menin Gate at Ypres. The last bears the names of some 60,000 officers and men ". . . who fell in Ypres salient, but to whom the fortune of war denied the known and honoured burial given to their comrades in death." The list of the great memorials will be completed when those at Thiepval, Vimy (for the Canadians), Villiers-Bretonneux (for the Australians in France), and Basra are added; but a number of smaller memorials commemorate those "missing" near where they fell.

Cemetery and memorial registers are published by the commission; these when finished will provide a complete record of the Empire's dead.

The unprecedented nature of the task with which the commission was charged is obvious; its complexity and magnitude will be realized when it is remembered that the 725,000 known graves for which they are responsible are scattered all over the world in many different countries with different laws and customs, some of them the enemy countries with whom special provisions were made in the treaties of peace to ensure the graves being respected; and there are no less than 15,000 burial places in different parts of Europe and the East where British sailors and soldiers rest, the great majority being in civil cemeteries containing small groups of graves, but some 1,500 of them being cemeteries of considerable size, the largest containing 12,000 graves.

Permanent Maintenance.—As a guarantee that the graves and memorials shall be forever cared for, the various governments of the empire represented on the commission have undertaken to provide permanently the income required for maintenance at the accepted standard of upkeep laid down by the commission. After discussion it was agreed that an endowment fund amounting to £5,000,000 should be established for this purpose by the United Kingdom and Dominion Governments and this fact was announced to the House of Commons on July 30, 1925, by Sir Laming Worthington-Evans, at that time chairman of the commission. Gen. Sir Herbert Lawrence, E. R. Peacock and Maj-Gen. Sir Fabian Ware were appointed the first trustees of the endowment fund.

French and American Graves.—France, on whose soil lay over 3,000,000 allied and enemy dead, was faced with the problem of honouring her fallen soldiers without clogging the wheels of industry and agriculture, which were beginning to revive under peace conditions, even in the devastated areas where the graves lay thickest. The British helped to solve the difficulty by concentrating all isolated graves into cemeteries which would forever mark the British battle-line. The French adopted the further expedient of giving the next-of-kin the opportunity of having their dead re-buried at the State's expense in the churchyard or burial-ground of their native place, while those who were left would rest in great national cemeteries constructed by the State as a lasting monument to the heroism of the soldiers who died for France.

About 50,000 fallen soldiers of the American Expeditionary Forces were borne back across the Atlantic to rest in their own land. The American authorities would no doubt have hesitated to undertake a task of such difficulty had not a pledge been given before a single American battalion left the United States that no American soldier who died fighting for his country and the liberties of nations should be left to lie on foreign soil except at the express wish of his next-of-kin. There are 30,703 American dead buried in eight American cemeteries in Europe. Six of the cemeteries containing 29,900 graves are situated in France; one, with 366 graves, is situated in Belgium, and one, with 437 graves, is

situated in England. The cemeteries are planned on the principle of uniform treatment of the graves, a conception which appears to have been first put into practice by those who laid out Arlington national cemetery, a burial place of many of those who fell in the American Civil and other wars of the United States.

(F. W.)

WAR GUILT. In Germany the question of War Guilt, the *Kriegsschuldfrage,* has given rise to an extraordinary agitation and a vast literature. The convinced vehemence of this national movement is not generally understood in other countries. Where understood, it causes more contradiction than acceptance. The result is amongst the difficult complications of post-war psychology. No universal agreement is yet possible about the relative importance of the known facts and forces leading up to the World War. Still less possible in our generation is any approach to agreement upon the inmost motives and calculations of the principal persons; upon the effects of different systems of Government, more democratic on one side, less democratic on the other; or upon the comparative ethical values of rival political ideals—as for instance, old loyalties to historic dynasties and empires contrasted with new and passionate aspirations to racial freedom.

Since no common ground for final judgment has been yet established even with regard to the proportionate importance of the broadest factors—history, geography, ethnography—while opinions concerning applied ethics are as much as ever in dispute, the method adopted here is that of the "Ring and the Book." It shows the various and opposite ways in which the same facts may be viewed by equally honest and thoughtful minds. First, these introductory words explain the origin and course of the War Guilt controversy; secondly the French standpoint is stated in a rigorously judicial temper by Monsieur Pierre Renouvin; thirdly, Herr Lütz states the German case with the same measured conviction and the same mastery of documentary evidence; fourthly, a concluding examination looks at the subject in quite another way from the standpoint of a political philosophy now generally accepted by the calmest thinkers amongst the English-speaking peoples. Monsieur Renouvin and Herr Lütz differ continually in their verdicts upon successive pre-war situations. The final section shows the deeper origin of conflicting thoughts and forces and why self-justification seemed equally convincing to all the antagonists.

The Allies and their great Associate made a far-reaching error when framing the Treaty of Versailles. In the heat of triumph and wrath, forgetting that victors in a war never can be accepted as impartial judges, they introduced into the voluminous clauses of that instrument two sweeping pronouncements:—

Article 227:—"The Allied and Associated Powers publicly arraign William II. of Hohenzollern, formerly German Emperor, for a supreme offence against international morality and the sanctity of treaties. . . . The Allies and Associated Powers will address a request to the Government of the Netherlands for the surrender to them of the Ex-Emperor in order that he may be put on trial."

Article 231:—"The Allied and Associated Governments affirm and Germany accepts the responsibility of Germany and her allies for causing all the loss and damage to which the Allied and Associated Governments and their nationals have been subjected as a consequence of the war imposed upon them by the aggression of Germany and her Allies."

The first of these Articles proved a fiasco. The Ex-kaiser remained safe in Holland where to all appearance, he lived happy ever after. The other Article, charging the German nation with peculiar and almost sole War Guilt (the former Habsburg empire having disappeared), was a more serious thing. It was a new and unnecessary humiliation, injecting the one-sided bitterness of war-passions into the terms of peace. This remains in Germany and Hungary a source of deep bitterness, delaying European reconciliation.

Chiefly to combat the accusation of almost exclusive War Guilt the German Government opened its diplomatic archives and poured out the invaluable collection of documents ultimately completed in 40 volumes under the title, *Die Grosse Politik der Europäischen Kabinette, 1871–1914.* Powerful associations were formed, and special publications founded, to vindicate German action, motives and honour in connection with the World War. Numerous books by individual authors, endless articles in reviews and newspapers appeared in the same sense. Apart from a handful of keen and unpopular German critics, who maintained that Habsburg blindness and the military over-confidence of the Central Empires were in fact mainly responsible for precipitating the struggle, the almost universal feeling of Germany with increasing fervour, repudiated the charge of special War Guilt, and put more and more of the blame on the Allies—especially on Serbia and Russia, but on French pre-war policy and British vacillation in the next degrees.

The agitation came to its height in Germany's years of recovery after the adoption of the Dawes plan and the evacuation of the Ruhr Valley. The present situation is a moral deadlock, and Germany as a whole desires some formal withdrawal of Article 231 in the Treaty of Versailles. As will be seen, this form of moral triumph is impracticable. It would have a one-sided effect. It would by itself be interpreted as an admission by the ex-allies —with or without their former associate—that they were chiefly in the wrong. This, their peoples do not admit now, and never will admit hereafter. The separate analyses, by Monsieur Renouvin and Herr Lütz follow in succession, below; and closing reflections by the present writer consider how a reconciling solution of the moral deadlock may be sought. (J. L. G.)

THE ALLIED CAUSE

If the student wishes to understand the chain of events which in July 1914 precipitated Europe into the most terrible war of history, and properly to weigh the respective responsibilities of Governments and peoples for the outbreak of that war, it is not enough for him to confine his attention to the crisis occasioned by the Serajevo murders of June 28, 1914. The nature of the crisis, and the attitudes of the various powers of Europe to the Austro-Serbian dispute, can be explained only by a survey of international politics over the long period which saw the gradual formation of the opposing groups of 1914.

Bismarck's Policy.—During the whole period from the Treaty of Frankfurt (1871) to his resignation, nearly 20 years later, Bismarck was convinced that, if she could obtain the support of another great Power, France was in a position to attempt a war of revenge. He accordingly endeavoured to ring Germany with a system of alliances, the ultimate object of which was to consolidate German hegemony in Europe. In 1873 he formed the Alliance of the three Emperors (Austria, Russia and Germany—the *Dreikaiserbund*), in 1882 the Triple Alliance (Germany, Austria and Italy). The key-note of his policy was the maintenance of a system under which Russia, as well as Austria-Hungary, would be bound to Germany. A constant menace to this policy, however, was the rivalry of Austria and Russia in the Balkans. Nevertheless, even after the Bulgarian crisis of 1886, the great chancellor succeeded in keeping his hold on Russia, by means of the secret "re-insurance" treaty. At the same time, Great Britain took a step towards the Triple Alliance by consenting to guarantee, in Italy's favour, the *status quo* in the Mediterranean. This was the period of the triumph of Bismarckian policy; with the exception of France, all the Great Powers of Europe were bound, more or less directly, to Germany.

No one knew better than Bismarck that the system was precarious. For its maintenance he reckoned on his own activities; he was the "juggler who could juggle with five balls at once." But his successors were incapable of maintaining his system. Scarcely had Bismarck been compelled in March 1890 to relinquish power as a result of his quarrel with the Emperor William II., when the men of the "new régime," the chancellor Caprivi, Marschall, the secretary of State, and Holstein, the *éminence grise* of the Wilhelmstrasse, decided to let the re-insurance treaty lapse. It expired in June 1890. It was this decision which, in addition to the anticipated renewal of the Triple Alliance in May 1891, determined the tsar of Russia to treat with France. The Franco-Russian alliance (military convention of Aug. 1892) marked the end of the German hegemony.

Nevertheless, this shifting of the political balance did not destroy the peace of Europe. The Emperor William knew that the tsar was inclined to peace; and the German ambassador in Paris repeatedly declared that France was no less so. Moreover, after 1895, Russia yielded to the blandishments of German diplomacy and embarked upon a career of adventure in the Far East which kept her out of European affairs. It was not until later that the situation began to turn to the disadvantage of Germany; and it was largely due to German diplomatic action that it did so turn.

1896–1904

Two main points are of importance in the development of European politics during this period—(a) the attitude of Italy; (b) the attitude of Great Britain.

Italy.—The object of the Italian Government was to find some outlet for its nationals on colonial territory. The adventure in Abyssinia, however, resulted in a disaster. Italy had, therefore, to look nearer home. But in 1896 Great Britain denounced the "Mediterranean agreement" of 1887. If, therefore, she was to make headway in the Mediterranean, Italy had to come to some agreement with the Power whose interests were the most directly opposed to her own. That Power was France. After 1896 this new turn in Italian policy became apparent in the colonial agreements of 1898 and 1900. In 1902 the *rapprochement* was crowned by a political agreement, in which the Italian Government placed its own interpretation on the terms of the Triple Alliance; it promised that Italy would be neutral in the event of France being compelled by direct provocation to make war on Germany. It is true that this agreement did not contradict the *letter* of the Triple Alliance, and there was reason in the contention of the Italian diplomats that Italy was entitled to conclude it; but it was difficult to reconcile the political formula signed in 1902 with the *spirit* of the Alliance.

Great Britain.—During the same period a profound change occurred in the general trend of British policy. The most prominent members of Lord Salisbury's Unionist Government of 1895–1900, and especially Joseph Chamberlain, were thoroughly alive to the fact that if she wished to maintain her position against the rivals who were threatening it on every side, Great Britain could not abide by her traditional policy of "splendid isolation." The problem for Great Britain was in what quarter should she seek support. In Asia her interests were opposed to those of Russia, not only in Persia and Afghanistan, but also in the Far East. In Equatorial Africa she was in conflict with France. Naturally she turned first to Germany. On two occasions, in 1898 and in 1901, the British Government approached the Wilhelmstrasse with an offer of alliance. On both occasions the German Government refused the offer, in the belief that a refusal was a matter of no particular moment to Germany. Vainly Chamberlain pointed out that the consequence would be that Great Britain would be compelled to seek diplomatic support "elsewhere," *i.e.*, from France. Von Bülow, the chancellor, and his colleagues persisted in the view that a combination of this kind was unlikely; sooner or later, they thought, the Foreign Office would make further offers to Germany. By the end of 1901 negotiations were abandoned; almost immediately afterwards the directors of British policy had grasped the necessity of a settlement of Great Britain's outstanding colonial difficulties with France. The famous agreement of April 8, 1904, recognized Great Britain's right to occupy Egypt, and the special interests of France in Morocco, and put an end to a whole series of minor bickerings, the chief of which was that connected with the Newfoundland Fisheries. There was in the treaty no general undertaking, and no political promise of any sort. It was, therefore, far from equivalent to the kind of agreement which Great Britain had endeavoured to conclude with Germany. Such as it was, however, it was an earnest of the new drift of British policy.

It remained to be seen whether these political germs would develop.

1904–1912

During this period the development was incontestable. The cardinal factor was the defeat of Russia in Manchuria, the result of which was to throw Russia back on Europe, where she found herself faced anew with the problems she had neglected since 1895, namely the Balkan Problem and the Straits Question (*q.v.*). But Russia was debarred for some years from playing an active part, owing to the disorganization of her army caused by the struggle with Japan. German and Austro-Hungarian diplomacy seized upon the temporary eclipse of Russia as an opportunity for a series of diplomatic adventures which were big with danger to the peace of Europe.

Moroccan Crisis.—After the signature of the Franco-British Agreement of 1904, the German Government was unwilling to allow France to secure a foothold in Morocco without asking for German permission and paying the price of German complaisance. As a matter of fact, German interests in Morocco were negligible; the question was one of prestige: German diplomacy refused to allow a matter of such importance to be decided without reference to Germany. Another object was to test the solidarity of the Franco-British *entente*. The policy was put into practice to the accompaniment of a series of threatening "gestures"; the kaiser's visit to Tangier (March, 1905); the virtual summons to the French prime minister, Rouvier, to throw overboard his foreign minister, Delcassé (June, 1905); and the demand for an international conference to settle the Moroccan question. On these points the French Government gave way; but the result was not in accordance with German expectations. The Algeciras Conference gave France and Spain police rights in Moroccan ports. Moreover, German methods had given rise to the suspicion that Germany was seeking a quarrel, with the consequence that the bonds of friendship between France and Great Britain were strengthened. Although it did not offer France the military alliance which Delcassé—prematurely perhaps—thought certain, the British Government began to consider the possibility of military intervention in a European war, and authorized its general staff to enter into "conversations" with the French general staff. It avoided, however, any undertaking which might bind it to any specific action in the future.

Russia.—During the Moroccan crisis, German policy gave proof of another tendency far more alarming to British susceptibilities. The Emperor William II. had seized the opportunity afforded by the Russo-Japanese War, to endeavour to create a "continental alliance" by means of a Russo-German Treaty, to which he hoped that France would be compelled to adhere. He all but succeeded in this design. In July 1905 he obtained the signature of the secret Treaty of Björkoe; but the tsar soon after repudiated the treaty. It was to be expected, however, that the attempt would be renewed. It was clear that the "continental alliance" would be aimed at Great Britain, and the Foreign Office was alive to the danger; to prevent a Russo-German combination, it began to consider the possibility of removing Russo-British differences. This was the object of the treaty of Aug. 30, 1907, which established a compromise solution of outstanding questions in Afghanistan, Thibet and Persia.

Thus, by 1907, there already existed the framework of the Triple Entente. True, the only documents so far signed between Great Britain and Russia, and France and Great Britain, were concerned with the settlement of outstanding difficulties, and contained no formula of mutual assistance, nor even any pledge of friendship for the future. The conditions where energetic and friendly co-operation between the three Powers would become possible were far from being realized. No basis had been laid down for common action. Nevertheless, the German Government made no secret of its alarm at a *rapprochement* of which it had itself, by both its real and apparent policy, been the main author.

Bosnia-Hercegovina.—In other ways, German and Austro-Hungarian policy and action tended to knit closer the bonds of the Triple Entente.

The Austro-Hungarian Government determined to take advantage of the temporary military weakness of Russia to secure certain advantages in the Balkans. In Oct. 1908, the annexation of Bosnia and Hercegovina by Austria-Hungary was announced. Serbia was alarmed at the prospect of a war with Austria-Hungary. Russia which had, at the outset, encouraged Count Aerenthal, in

the hope of securing a counter-balance in an advantageous settlement of the Straits Question, protested when she found herself deprived of the anticipated compensation. The situation was, thus, similar to that of 1914:—an Austro-Serbian dispute, involving a conflict between Austria and Russia. But Russia was in no condition to make war. Faced with an ultimatum from Germany, she was compelled to recognize the annexation of Bosnia and Hercegovina, and to abandon the cause of Serbia. Time was to show that she did not forget this humiliation.

The "Agadir" Incident.—The next crisis was provoked by the German Government. After endeavouring—at the time of the Bosnian crisis—to share with France the profits of the economic development of Morocco (agreement of Feb. 1909), the German Government complained that this *condominium* was in practice operating in a manner unfavourable to its interests, and resolved to check the growth of French influence in Morocco. The Act of Algeciras gave Germany the means of doing this. The occasion seized upon was the entry of the French troops into Fez in the spring of 1911. The German Government contended that France was exceeding her rights and demanded compensation. Such compensation was on the point of being granted when, in June 1911, Jules Cambon, French ambassador at Berlin, let it be understood that the French Government was not averse to negotiations. But at this point German diplomacy attempted to force the situation by the "Agadir coup" (July 1, 1911). Once again the policy of threats failed to give Germany the results expected. She had demanded the whole of the French Congo. She had to content herself with a slice of the Congo *hinterland*, largely because of the strong stand taken up by Great Britain, and the unmistakable warning given Germany by British statesmen. The Franco-German agreement of Nov. 4, 1911, put an end to the crisis, but did not efface the memory of Germany's threats.

Naval Competition.—In the meantime, Great Britain was more and more alarmed. She believed that the attempt of the Emperor William II. and Admiral von Tirpitz to make Germany a great naval Power menaced her most vital interest. On several occasions between 1908 and 1911, the British, who were determined to maintain their naval supremacy, tried in vain to secure some limitation of the German naval programme. In Feb. 1912, a last attempt was made to come to some arrangement, on the occasion of Haldane's mission to Berlin. Negotiations broke down because, in return for a reduction—or rather a slowing-down—of her naval programme, Germany demanded a political *quid-pro-quo* in the shape of a promise of British neutrality which would have been the death-blow of the Entente. By 1912 the consequences of this failure became apparent; to consolidate its naval position, the British Government increased the concentration of its capital ships in the North Sea; those taken from the Mediterranean were replaced by French vessels. In return for this service from the French fleet, Great Britain had to sign a document formally authorizing "technical conversations" between the general staffs of the two countries. But the letters exchanged on Nov. 22, 1912, repeated that these naval and military arrangements did not bind the respective Governments, and did not constitute any promise to intervene in a war.

1912–1914

During these years the situation in Europe gradually changed. In the preceding period the weakness caused by her defeat in Manchuria had kept Russia quiet, and the first moves calculated to disturb the peace of Europe had been made by Germany and by Austria-Hungary. But it was henceforth the object of Russian policy to repair the consequences of the reverse suffered in 1908–09, and to re-establish Russian influence in the Balkans. An opportunity was offered in the Italo-Turkish War of 1912. The embarrassments of the Turkish Government incited the Balkan States to unite to liberate Macedonia. In this they were encouraged by Russia, who presided over the formation of the Balkan alliance. Once again the Balkan crisis of Oct. 1912 revived Austro-Russian antagonism, and threatened anew the peace of Europe.

It remains to describe the attitude to this crisis of the Great Powers of Europe.

In the Franco-Russian camp, France exercised a moderating influence. When Poincaré (then prime minister) read the text of the Bulgaro-Serbian convention, he was amazed and protested. "This," he said, "is a convention for war." At the request of the French Government, Russia tried too late to hold back the Balkan States. In Nov. 1912, at a moment when the question of a Serbian port on the Adriatic seemed likely to lead to a war between Austria and Serbia, Russia vainly tried to secure from France a promise of unconditional support. Thus, the Russian Government, as it had done in previous crises, once again advised the Serbians to give way.

Among the Central Powers, in the autumn of 1912, Austria could reckon on the support of Germany. But when in the summer of 1913 Vienna thought of intervening, in the "fratricidal strife" between the Balkan States and of supporting Bulgaria against Serbia, at the risk of a general war, she was prevented by Germany and Italy.

The crisis was ended by the Treaty of Bucharest. The victory of Serbia was a triumph for Russia and a momentous defeat for Austria-Hungary. At Vienna there was unanimity that the treaty must be revised. The new and serious factor in the situation was that Germany, who had held back her ally in 1913, was now resolved to assist her. Germany felt that she had reached "a turning point in the development of her world-power."

There was thus no respite to the feeling of unrest in Europe. At the end of 1912, the German great general staff demanded an increase in Germany's army reserve; France replied with the Three Years' Service Act of Aug. 1913. Austria also increased her effectives. Russia was engaged in the execution of an armaments scheme on a large scale, which it was not expected would be completed before 1917. The British Government was busy laying down the conditions of naval and military co-operation with the British dominions. All the Great Powers were thus fairly embarked on the "Race of Armaments." Public opinion became accustomed to the idea of an inevitable war. It should be noted, however, that neither Great Britain, nor France, nor Russia had any interest in provoking a general war at that time: Great Britain because she deemed it impossible to introduce compulsory military service; France, because she was deficient in heavy artillery; Russia, because she needed several years more to extend and complete her new programme. In Germany the situation was very different. The army was ready. In the spring of 1914, General von Moltke stated that conditions for Germany were as favourable as they were ever likely to be. But of all the Great Powers, Austria-Hungary alone had prepared a plan of action which she wished to put into execution as soon as possible. The Serajevo murders gave her the chance to do so.

Serajevo.—The murder, on June 28, 1914, of the Archduke Franz Ferdinand, heir to the throne of Austria-Hungary, was the act of Bosnian students, subjects of Austria-Hungary; but the murderers came from Belgrade, and their arms were of Serbian origin. The Austrian Government had not the slightest proof that the Serbian Government was privy to the murder—in fact, it did not even presume so; but it considered the murder to be the consequence of nationalist propaganda for which official circles at Belgrade were indirectly responsible.

As a matter of fact, the Austrian Government was mainly moved by the fact that it regarded the murder as its long looked-for opportunity to "settle accounts" with Serbia. Its object was to send a "punitive expedition" against the Serbian kingdom, and to "eliminate Serbia as a political factor" in the Balkans. On July 5 the German Government approved the Austrian plan. It took the view that Austria must act with energy, if she was to avoid disruption under the pressure of separatist movements. This was, in Germany's view, a "vital" Austrian interest. But Russia had to be reckoned with. Unless Russia was prepared to submit to a humiliation as deep as that of 1908–09, she could not afford to leave Serbia to be crushed. True, this was not a "vital interest" in Russia's case; but her prestige as a Great Power, and the whole of her influence in the Balkans was at stake. The German Government coolly weighed the risk to European peace involved in the policy of Austria-Hungary. War against Serbia might lead to a general war. Nevertheless the Central

Powers did not hesitate to provoke the crisis.

Attempted Mediation.—After long and careful preparations, in which Germany took a share, Austria-Hungary launched at Serbia's head an ultimatum (July 23) couched in terms such as almost necessarily to cause a rupture, and then proceeded to break off diplomatic relations. The danger at once became apparent. Instantly the Russian Government declared that it would stand by Serbia; the diplomats set to work to prevent an Austro-Serbian from becoming an Austro-Russian quarrel. The Power best adapted to play a mediatory part was Great Britain, who was not bound by any alliance. Great Britain proposed a conference of all the Great Powers, except Austria-Hungary and Russia. Germany refused to "drag her ally before the bar of Europe." But since Russia was proposing "direct conversations" between herself and Austria, and since Great Britain was still engaged in looking for some formula of conciliation, the Government of Vienna, in order, as it said, to avoid any further attempt at mediation, hastened to declare war on Serbia (July 28, 1914). From a military point of view the declaration was an idle gesture, as the army was not ready. But the diplomats of Austria-Hungary were anxious to give the impression that Austria was about to take immediate action and that she would not allow herself to be held back by any pressure from outside. This was a decision fraught with serious consequences, since it was calculated to provoke "counter-measures" on the part of Russia. Germany was aware of this; nevertheless, she approved the declaration of war; indeed, her ambassador at Vienna had even gone so far as to advise Austria to declare it.

Russia.—Next Russia took a hand. How was Russia to prove her will to defend Serbia, except by military measures? Her reply to the Austrian declaration of war on Serbia was partial mobilization (July 29). The following day, in view of Germany's expressed resolution of supporting Austria-Hungary, Russia decided on general mobilization, before any similar step had been taken by any other Great Power. But Sazonov, the Russian minister for foreign affairs, stated that his troops could remain "for weeks, with grounded arms, without crossing the frontier." Sazonov was still ready to negotiate. But it was uncertain whether the Central Powers were disposed to compromise. The tsar made a personal suggestion to the kaiser that the Serbian question should be referred to the Hague Court. The kaiser did not reply. On the same day (July 30) the Austro-Hungarian Government decided to reject a further British offer of mediation, namely, the occupation of Belgrade as a pledge, before the initiation of international negotiations. Despite the advice of the German chancellor, Bethmann-Hollweg (who, since he had received reason to fear that Great Britain would intervene in a general war, had begun to fear the consequences of his ally's intransigence), the Emperor Francis Joseph, Count Berchtold, and General Conrad von Hoetzendorff, the chief of the Austrian general staff, came to an agreement to eliminate the possibility of any peaceful solution of the question. The quarrel with Serbia must be settled by arms, even at the price of a European war. Thus the negotiations upon which the Russian Government was still ready to enter were never begun. But the Russian general mobilization provided an opportunity of precipitating the crisis. On July 31, Austria-Hungary decided on general mobilization. The German great general staff, whose whole war plan was dependent on success at the outset, was afraid of being anticipated by Russia. On the same day Germany issued her twofold ultimatum. If France was ready to remain neutral, it was the intention of the German Government to demand the fortresses of Toul and Verdun, as a guarantee of France's neutrality. This demand would clearly force France to intervene. While the diplomats were roughing out final attempts at conciliation, the various general staffs were working at full pressure. It was too late to find a compromise. "Quick action is Germany's asset," was the reply of von Jägow (German undersecretary for foreign affairs) to the British ambassador. On Aug. 2 German troops violated the neutrality of Belgium, according to the plan drawn up by the great general staff. On Aug. 3 the British Government asked parliament for war-credits, at the very moment when Germany was declaring war on France.

Summary.—The above rapid survey points to two conclusions:

1. In the spring of 1914 Europe was in a dangerous situation. It is true that the system of alliances, the principle of the balance of power, and the race of armaments had, even more than the bitterness of economic competition, developed an attitude of mind which was already in itself a danger to peace. But on which nation rests the initial responsibility for this situation? Such responsibility cannot be laid at the door of all the Powers indiscriminately. Russia must no doubt bear her share of responsibility. But a survey of the development of international relations during this period shows clearly that the essential *raison d'être* of this atmosphere of unrest in Europe is to be found in the methods by which German policy was pursued. It is quite possible that in 1905, and again in 1911, Germany did not deliberately desire war; but she acted as if she desired it. It was the actions of the Imperial Government which accustomed Europe to the idea of war.

2. The Serajevo murders gave the Central Powers the desired opportunity of "improving their position." Austria-Hungary seized the opportunity and Germany followed her. Properly to weigh these responsibilities, it is not only the last phase of the crisis which should be considered; by then the Governments were no longer free as against their respective general staffs. They were fettered by "technical" considerations. Russia hastily decided to transform her partial mobilization into a general mobilization. Germany listened to no advice and precipitately declared war. But what must be considered is: what was the conscious, considered action of the various Governments during the period when they were still masters of their own decisions? The answer must be that the Austro-Hungarian Government decided to make war on Serbia, even at the cost of a European war; it rejected attempts at mediation; it hastened to declare war in order to prove its will to withstand Europe. Until July 28, Germany approved the action of Austria-Hungary and unreservedly supported her. By that date all the *essential preliminary conditions* of a European conflict had been brought about by the action of the Central Powers. (P. Rn.)

THE GERMAN CASE

The question of War Guilt, considered as a moral problem, has no historical foundation, for in 1914 war was an institution recognized by international law. Among the general causes of war are: imperialism, nationalism and Chauvinism; economic competition with its scramble for colonies and markets; armaments, arousing mutual fear and suspicion; the pursuit of vital interests and prestige; the obligations of alliances—in short, the entire political system as it existed before the war and the responsibility for which is universal.

In this, by an evolution which had partly been developing for centuries, four main antagonisms had paved the way for the World War. These were, Franco-German relations and the Alsace-Lorraine question; the rivalry of Russia and Austria in the Balkans and Russia's ambitions towards Constantinople; the naval rivalry between England and Germany; and Italy's aspirations for Austro-Hungarian territory.

Prussia's increasing strength and her victory in 1866 (Sadowa) had roused the jealousy of France; the latter was concerned for her hegemony and determined to prevent the unity of Germany and, at the same time, to realize her historic claims to the Rhine territory. It was this, and not the question of the Spanish succession or the Ems telegram which was the decisive cause of the war of 1870–71. Europe shared the view of Gladstone and his colleagues that France undertook an "immense responsibility" at that time. Napoleon III. voluntarily acknowledged himself to be the aggressor. It was considered reasonable and even just that Germany should take back from him the provinces of Alsace and Lorraine which had previously belonged to her, and of which the only non-German speaking portion was Metz and the surrounding district.

Great Britain, among other States, hailed the birth of the German empire as a counter-weight to France and Russia. Bismarck, from 1871 to 1890, was recognized as a "pillar" of Euro-

pean peace. It was he who succeeded in averting the danger of war between England and Russia (1877–78), between Russia and Austria (1886–87) and the war of revenge (Boulanger) which threatened to break out at the same time. Russia's growing hostility after the Congress of Berlin caused Bismarck to form the alliance with Austria-Hungary (1879) which was acclaimed by Lord Salisbury. Driven by the *cauchemar des coalitions* Bismarck's sole aim in extending his alliances was to ensure the integrity of Germany. This did not involve any prejudice to France; on the contrary—aided by Bismarck, in the hope of conciliating her—France was able at that period to acquire extensive and valuable colonies.

Bismarck's successors, with the same objects in view, lacked his masterly skill. The non-renewal of the "re-insurance compact" with Russia (1890) hastened the Franco-Russian *rapprochement*. The alliance (1891–93) was nominally, like the Dual Alliance, a defensive one; whilst, however, the latter was intended to maintain existing conditions, France thought to regain her lost provinces and her hegemony, and Russia had in mind her interest in the Balkans and the Dardanelles.

1896–1904

The division of Europe into two alliances did not, in itself, constitute a menace to peace. Moreover, the Triple Alliance was predominant so long as Italy adhered to it and England did not join either group. But it was just in this respect that important changes occurred. Delcassé, the French foreign minister, was able in 1899 to effect a considerable extension of the Franco-Russian Alliance, which was directed against Germany and based on the anticipated breaking up of Austria-Hungary; by setting off Tripoli against Morocco in 1900 and thus creating a mutual interest between Italy and France, he succeeded in 1902 in rendering Italy a "dead weight" in the Triple Alliance.

Anglo-German Negotiations.—The change in Anglo-German relations which occurred about the same time was still more important. Bismarck himself had repeatedly sought to obtain a union with England. Now, in 1898, the initiative came from London. Owing to serious friction with Russia and France, the competent British ministers considered that the time had come for Britain to abandon her "splendid isolation." Lord Salisbury endeavoured, first of all, to make a comprehensive agreement with Russia on Far Eastern and Turkish questions. When this attempt failed, owing to Russia's attitude, the Colonial secretary, Joseph Chamberlain, turned to Germany. His hostility to Russia was unconcealed; but Germany held back from a reasonable fear of provoking a war with Russia which would have meant a war with France also. The British Navy could not offer protection against the vast Russian armies; Germany had no wish to "pull the chestnuts out of the fire" for England. Nevertheless several colonial agreements were made between England and Germany. In 1901 negotiations for an alliance were renewed, and the evidence of the British Foreign Office shows that the initiative came from Germany. The British cabinet was split: whilst the foreign secretary, Lord Lansdowne, and a few of his colleagues were in favour of *rapprochement* with Germany, the prime minister, Lord Salisbury, and the under-secretary of State, Bertie, were strongly opposed to it, and even Lansdowne was sceptical as to the possibility of a genuine alliance. The German proposal was that the whole British empire on the one side and the whole Triple Alliance on the other should be regarded as entities and that the *casus foederis* should arise in the case of England or one of the overseas dominions, or alternatively of any member of the Triple Alliance, being involved in war with more than one Power. Lansdowne, in view of the existing opposition and the ill-feeling between the peoples which had been roused by the Boer War, did not think it possible to achieve such an agreement, but although the prime minister's view was not in accord with his, he attempted to come to separate agreements with Germany. German diplomacy was undoubtedly wrong in not seeking to follow this path, although the subjects of negotiation (Morocco; the Mediterranean; the Persian Gulf, etc.) were certain to aggravate the friction with France and Russia. It is remarkable that at this time the disputes of 1884–85 between England and Germany on colonial questions and the Kruger telegram appeared to be completely forgotten; that the German naval programme of 1897–98 did not affect the negotiations, and that German statesmen took the ultimate *rapprochement* of Germany and England for granted. Instead of this —under the zealous efforts of the French Government—that came to pass which Joseph Chamberlain had predicted: England's *entente* with France and Russia.

After the division of Europe into two groups of alliances (1893) England's relation to these groups became the deciding factor; and the fact that from the Serajevo murder of 1914 there arose a World War, was the result of the gradual development of the alliance system from 1893 onwards. In order to attribute responsibility justly, therefore, the nature of these two alliances, their aims and actions, must be carefully considered. It must be recollected that Lord Salisbury and Sir Francis Bertie wished to preserve England's isolation as the balance in the scales, and that the *entente* with France was formed, not because of Germany's aggressive attitude, nor because of her fleet, but because London wished to eliminate all causes of friction with France.

1904–1912

Moroccan Crisis.—In contrast to the Triple Alliance and to the German proposals for an alliance made to England in 1901, which aimed at maintaining the *status quo*, the Anglo-French *entente* of 1904 was an agreement made with a view to acquisitions: Egypt, which still belonged to Turkey, was to be acquired by England, in spite of repeated promises of evacuation; and independent Morocco was to be acquired by France. In regard to Egypt, Germany had always acted in the interests of Great Britain, but by virtue of treaties she had interests in Morocco; moreover, the increasing German trade there was greater than either Italy's or Spain's. In 1901–02 Delcassé had, during secret negotiations with Spain, provided for concessions to Germany on the Atlantic coast of Morocco, and England, too, had repeatedly recognized the German interests in Morocco. France compensated Italy, Spain and England, but she ignored Germany's interests and rights. Contrary to the international compact of Madrid (1880) and the Anglo-French agreement published in 1904, the secret clauses of the latter, revealed in 1911, anticipated a division of Morocco between France and Spain. During the negotiations of 1903 Lord Cromer had correctly prophesied that, before long, Morocco would be a "French province," which, with the French system of protective tariffs, meant that the commerce of the other Powers would be suppressed. France, however, already owned a large colonial empire, which more than sufficed to supply the needs of her stationary population of 40 million; Germany, on the other hand only possessed a few colonies of no great value, and had a population of 60 million which was increasing year by year and could not be supplied from her own products. Germany, therefore, had a vital interest in keeping open the markets of the world. That was the chief motive for her attitude in 1905, when France's intentions, in accordance with Lord Cromer's prediction, became apparent. The reaction to France's provocative behaviour and the desire to protect Germany's disregarded rights, resulted in the landing of William II. at Tangier (March 1905) and the demand for an international conference. All this was accompanied by an undercurrent of misconceptions and blunders.

In view of the Russo-Japanese War, the time seemed to Germany favourable for an attempt to shatter the *entente*, and she worked for the downfall of the admittedly dangerous Delcassé, of whom the premier, Rouvier, equally recognizing his danger, wished to be rid in any case. It would have been wiser if Germany had pursued the negotiations for compensations offered by Rouvier. However, there was no thought of war with France; the shortlived treaty of Björkoe (1905) envisaged rather a *rapprochement* between France, Germany and Russia. This treaty was intended to protect the Continental Powers from English encroachments. At the Conference at Algeciras, which welded the *entente*, Germany secured equal commercial rights in Morocco, whilst France and Spain obtained rights of a political nature.

The Anglo-Russian *entente* (1907), actively promoted by

France, was also acquisitive in character, and was again mainly formed at the expense of a free, independent country—Persia. One of the aims of this agreement also was to prevent Germany from gaining any political influence in Persia, and to exclude her as far as possible from any economic advantages. Germany, isolated with Austria-Hungary, from the Powers, raised no protest.

Bosnia-Hercegovina.—In the middle of Sept. 1908 the Russian and Austrian foreign ministers came on principle to an agreement in regard to the early annexation of the provinces of Bosnia and Hercegovina (which the Congress of Berlin, 1878, had placed under the administration of Austria-Hungary), in return for Vienna's diplomatic support for the opening of the Dardanelles to Russian battleships. Iswolski believed that he could gain the support of the *entente* for his aims; he failed chiefly in London. Berlin had no hand in the affair, but in the crisis which followed the annexation (1908) she afforded her ally unconditional support, under the firm conviction that war between the Powers would not take place. Serbia, which Iswolski had been prepared to sacrifice to his own interests, egged on by Russia, demanded quite unjustified compensation, and mobilized. As the crisis in 1909 threatened to lead to war between Austria and Serbia, the German Government put an end to it in the interests of general peace by an ultimative message to St. Petersburg. Iswolski, whose plans had failed mainly through his own fault, became henceforward an irreconcilable enemy of Austria-Hungary.

Naval Competition.—In the meantime Germany's naval policy had entered upon a dangerous path. She had the right in common with the other Great Powers, to provide for the defence of her overseas interests, which were then developing with impetuous energy. But England felt that the Tirpitz programme, the principal factor in the relations between England and Germany, was of a threatening nature. The fleet, however, had not been built for purposes of attack, but in order to deter England from attacking. Germany's fear of British supremacy on the sea played, in this case, as important a part as England's fear of a German invasion, although competent Englishmen regarded this invasion as impracticable. With the agreement of 1913 fixing the proportions of ships at 16:10, naval rivalry lost most of its acuteness.

Agadir Crisis.—It is true that Kaiser William II. was a disquieting element in European politics; his personality, however, was by no means warlike. It was with reason that, at the very beginning of his reign, those who were closely connected with him perceived in his blusterings a feeling of uncertainty, even of fear, and saw in him pathological traits. Besides, apart from the question of the navy, William II. certainly had no deciding voice in German policy. The Morocco episodes, for example, were not in accordance with his views.

After a Franco-German agreement for economic co-operation in Morocco (1909), the carrying out of which on the part of France gave Germany the right to complain, France, in the spring of 1911, in spite of Germany's representations, broke the Treaty of Algeciras by the march on Fez. France recognized that the German claims for compensation were justified, but the negotiations did not progress very fast, so in July, Germany sent a gunboat to Agadir. This "thumping on the diplomatic table" was a reaction to previous provocation. France knew that Germany wanted nothing for herself in Morocco; Germany had no warlike intention, but wished only, by compensation, to put an end to the Morocco question once and for all. With the consent of Sir Edward Grey, who was thoroughly mistrustful of Germany and insufficiently informed, Lloyd George delivered a threatening speech against Germany, which precipitated the crisis. Supported by England, France received the lion's share in the agreement of Nov. 1911. The crisis had serious results: the independence of Morocco being at an end, Italy resolved to seize Tripoli, her share of the booty, by force also, and the consequent weakening of Turkey in its turn caused the Balkan States to go to war.

1912-1914

The Balkan Crisis.—The Russian defeat of 1905 and the *entente* with England, 1907, had led Russia again towards her "European aims." The Bosnian crisis was a result of this development. Russian diplomacy now aimed at the union of the Balkan States. When the prime minister, Poincaré, at St. Petersburg, heard of the Serbo-Bulgarian alliance (1912), he at once made urgent representations against this "war" convention. This, too, was a treaty of acquisition. Russia was unable to prevent the Balkan States from attacking Turkey. According to Poincaré Russia "had started the motor." A remarkable change took place in Paris on the unexpectedly rapid collapse of Turkey. As lately as the Bosnian crisis France had declared that she would not let herself be involved in war because of Russian interests in the Balkans, but now French experts and statesmen considered the chances of Russia and France in the case of a general conflict to be "very optimistic." Paris took the point of view that the maintenance of the balance of power in the Balkans affected French interests; henceforward France nourished the Russo-French alliance by the Austro-Russian rivalry.

In Feb. 1913, the Russian ambassador in London arrived at the conclusion that of the Powers France alone would see war declared without great regrets. On the other hand, the English and German Governments were working together for peace. Austria-Hungary, indeed, joined with Italy in preventing Serbia from obtaining a footing on the Adriatic, but accepted Serbia's enormous increase in territory; and when Austria-Hungary wished to intervene in the "fratricidal" war (of the Balkan States) in favour of Bulgaria she was prevented by Germany and Italy. With the Treaty of Bucharest (Aug. 1913) which resulted in the practical withdrawal of Rumania from the Triple Alliance, Austria-Hungary found herself heavily handicapped. Russia had completely wiped out her humiliation of 1908–09 and the *entente* had acquired predominance over the Central Powers not only diplomatically but also materially. The cohesion of these groups of alliances obviously contained the danger of local conflicts turning into a world conflagration. Realizing this the Government of the Reich sought repeatedly to renew good relations with Russia (Björkoe, Potsdam) and especially with England. The neutrality negotiations of the Haldane Mission of 1912 broke down at the end because of mutual mistrust. But Anglo-German colonial treaties, which were about to be signed in 1914, loosened the tension of the relations between the two Powers, after London had at last withdrawn her objections to the Baghdad railway, in which in 1903 she had refused to take her fair share. France and Russia were displeased with these developments; France intervened decidedly in the Anglo-German neutrality negotiations and in 1914 actively promoted closer relations between England and Russia, for the foreign minister, Sasonov recognized that in a general war it was the British fleet alone that could be relied upon with certainty to give Germany her death blow.

Armaments.—The Foreign Office had, as early as the close of the century, described the situation of Germany between France and Russia as dangerous, and as critical should England come to an understanding with France (and Russia). The renewed shuffling of power in the Balkans forced the German Government in 1913 largely to increase its army. Simultaneously France reintroduced three years' service, a burden which could not have been borne for any length of time. At the Hague Conferences, Germany's attitude had differed from the others more in appearance than in principle. If German militarism was especially obvious, France in actual numbers was militarized to a far greater extent; up to 1913 only 55% and subsequently 68% of the man power in Germany against 75% in France. But Russia was the most zealous in arming, having been financed for this purpose by France to the extent of many milliards. In 1914 the peace strength of the Central Powers (without Italy) amounted to 1,239,000 men against 2,239,000 (and 2,639,000 in the winter half-year) for France and Russia; the war strength 3,358,000, against 5,070,000.

In the winter of 1913–14 the Liman von Sanders affair brought about a new crisis. Russia considered her interests in the Dardanelles to be imperilled; England held aloof; Germany was conciliatory; France, however, accentuated her attitude of 1912–13: the ambassador Delcassé assured Russia on behalf of the French foreign minister "that France would support Russia to whatever

extent she required." The Russian war minister and the chief of the general staff declared categorically that "Russia was fully prepared for a duel with Germany" and Austria-Hungary. In Feb. 1914, a conference of ministers at St. Petersburg decided to make preliminary preparations for a later conquest of the Dardanelles. About this time, Delcassé repeatedly discussed France's war aim with Sasonov—the Russo-French alliance had gradually acquired the meaning that Russia should receive Constantinople and France Alsace-Lorraine. In this, Russia counted for certain on Serbia's support. As early as 1908–09 it had held out hopes to Serbia of the acquisition of Austro-Hungarian territory. These promises were renewed in 1912–13, the minister Hartwig at Belgrade acting as a dangerous element in this matter. While Russia was in no way threatened from abroad, Austria-Hungary's existence was imperilled by Russia's Pan-Slav Balkan policy which furthered the undermining of Bosnia and Hercegovina by Serbian societies. Germany herself was greatly alarmed about Russia's mighty war-preparations and the imminence of an Anglo-Russian naval convention. In all the chancelleries of Europe, war was considered to be inevitable. The chiefs of the general staffs, Moltke and Conrad, anxious about the security of the Central Powers, spoke of a preventive war. To this Bethmann-Hollweg—and also the kaiser—was definitely averse. As in Berlin and Vienna, in St. Petersburg, Paris and London there were highly placed officers who, confident of victory, desired war, and this not merely for the maintenance of the *status quo*. Colonel House found, in the early summer of 1914, that France and Russia were ready to take action as soon as England would agree. And in this war-charged atmosphere the crown prince, Archduke Francis Ferdinand, a pillar of the Danubian monarchy, was murdered on June 28, 1914. It was the spark in the powder magazine of Europe.

Serajevo.—A colonel of the Serbian general staff and a Serbian major had organized the assassination; it was carried out by Bosnians. The Serbian Government had had knowledge of the plan, but after a weak effort to prevent it, had let the plot proceed. Vienna did not know this, but at once established that Major Tankositsch and the Serbian frontier officials had aided the murderers in a decisive manner. The Serbian menace was suddenly laid bare; the indirect responsibility of Serbia could not be questioned. From Berlin and other quarters Serbia was repeatedly urged to investigate the plot, but trusting in Russia's protection, for weeks Serbia did nothing and was thus guilty of a grave dereliction of duty.

In the place of an intended diplomatic action, Vienna decided, after the murder, on a punitive expedition against Serbia, which was to be eliminated as a political factor. Berlin agreed to this on July 5–6, and indeed encouraged quick action, on the assumption that the outraged public opinion of the world would be in sympathy. The vital interests of Germany's only certain ally appeared seriously menaced and her own position affected. It was thought that neither Russia nor France was ready for war and that their entry into war was improbable, although this was taken into account. It was believed that England would remain neutral, and this would restrain France and Russia from extreme action. This was a gross misunderstanding of the situation.

Even before they were acquainted with Austria's ultimatum (July 23) Russia and France adopted a common programme for the preservation of Serbian integrity and sovereignty. But Vienna's ultimatum and intentions touched both these points. Already on the afternoon of the 25th the French ambassador in St. Petersburg gave formal assurance that France placed herself "unreservedly" on Russia's side. On the same evening Vienna, on the receipt of an unsatisfactory reply and in view of Serbian mobilization, which had been begun, broke off relations with Serbia and ordered the mobilization of eight army corps against Serbia. Simultaneously, the "war preparation period" began in Russia. Following Austria's declaration of war on Serbia, which was issued with Germany's knowledge on July 28, Russia ordered, on the 29th, a partial mobilization against Austria-Hungary, after the tsar had first consented to the general mobilization. Yet the danger of a general war, which had now arisen, might still have been averted.

Diplomacy.—London was the deciding factor for both sides. Timely declarations in Berlin and Vienna at an earlier moment would have led to the giving up of the proposed programme, warnings in St. Petersburg against too hasty military preparations would have secured the necessary time for the completion of negotiations. But Anglo-French military and naval conventions, the whole policy of the *entente*, had created a moral bond, a pledge of honour for England towards France. Russia and France now counted on this. Sir Edward Grey had the fullest confidence in the desire of France and Russia for peace and had the greatest mistrust of Germany, whose ostensible plans of hegemony were as much feared by the Foreign Office as a break with Russia in the event of support being refused. Instead of warning the Russians, Grey encouraged them on July 25 in their mobilization against Austria-Hungary, on the quite groundless assumption that German preparations were much further advanced than the Russian. Grey, however, did not want war and worked zealously for peace. But his proposal for a Conference was not practical, for the crisis demanded a rapid decision. In this respect Rome made the best proposal: namely that Serbia should offer to Europe the acceptance of the entire ultimatum in exchange for a European guarantee for Serbia. Berlin recommended this solution in Vienna. On the Serbian reply William II. declared (July 28) that Austria had no further ground for war. Serious reports regarding England's attitude furthered this change of policy. Berlin urged Vienna to be satisfied with a "material security"; and Grey put forward similar proposals at the same time.

Russia.—Berlin further sought to promote the conversations between Vienna and St. Petersburg that Germany had instigated; Grey also considered this the best course. A proposal of the tsar to submit the dispute to The Hague was not accepted even by Sasonov; he regarded the general war as a fact after the declaration of war on Serbia and the bombardment of Belgrade on the 29th. He had, in his own words, from that time lost all interest in the negotiations—he was in fact entirely for war. It was otherwise in Berlin; realizing the danger, the Government was from the 29th entirely for peace. It increased the pressure on Vienna begun on the 28th even to the point of threatening withdrawal of support. Vienna, which had left Berlin inadequately informed on important matters, now agreed on the 30th–31st to assure Serbia's integrity and sovereignty. Thus the Russo-French programme was practically carried out. But at the same time Russia, by her general mobilization ordered on the afternoon of the 30th on purely technical grounds, precipitated the general war. For this mobilization, because of Germany's dangerous situation between two fronts, and even in the opinion of the experts of the Triple Alliance, made war inevitable. It was different as regards the general mobilization ordered in Austria-Hungary on mid-day of the 31st on the ground of Russia's partial mobilization; according to the Russo-French military convention, Russian and French mobilization was to be ordered, not on Austria's mobilization but only subsequent to that of Germany's, whereas the opposite occurred in 1914, indicating the aggressiveness of Russia's step. In this France did not seriously restrain Russia; rather Russia was encouraged by the Quai d'Orsay and by the French minister for war, in the same way as Moltke intervened in Vienna, where the German ambassador pushed on in the same way as the French ambassador in St. Petersburg. However Count Berchtold has certified that he was influenced neither by von Tschirschky nor by von Moltke. On July 31, the French Government declared itself determined on war although her alliance with Russia had not come into play.

Sir Edward Grey recognized that the Russian general mobilization had precipitated the crisis. If London and Paris had brought similar pressure to bear on St. Petersburg, as Berlin had on Vienna from the 28th onwards, the peace of Europe might have been maintained.

On Russia's decisive action, Germany on the 31st, declared a state of war emergency (*Kriegsgefahrzustand*) to exist and sent an ultimatum to Russia and France, as French diplomats had expected; the demand for the surrender of Toul and Verdun was not presented in Paris. In taking its military measures, Ger-

many was always behind France, even in the mobilization on Aug. 1. Germany's declaration of war on Russia on the 1st and on France on the 3rd was, according to the Franco-Italian agreement of 1902, fully justified. As recognized by international experts, if Germany, in her hemmed-in position, was to have a chance of success in a war on two fronts, she must first attack France through Belgium. But before the German ultimatum to Belgium was known, England had practically been drawn into the war on Aug. 2, in consequence of the Anglo-French naval convention. The breach of Belgian neutrality became the ostensible and popular *casus belli.* Italy decided on temporary neutrality, in view of her relations with Austria-Hungary and above all because of England's attitude.

Summary.—To summarize the deeper causes of the war: so long as the Triple Alliance was predominant and Russia was occupied in Asia, peace reigned in Europe. Yet with the partition of North Africa (Tripoli–Egypt–Morocco) and Persia by the *Entente,* together with France's aggression in Morocco and the pursuit of Russia's European aims, the violent progress of which was only made possible by France's milliards, crisis followed crisis (1905, 1908, 1911, 1912/13). Germany, indeed, contributed her share by her naval development and her misunderstood *"Weltpolitik,"* by her blustering and blunders; but it was not overpopulated and economically restricted Germany which acquired great and rich territories, but the *Entente,* already blessed with colonies.

As regards the crisis of July 1914, it must above all be remembered that Austria-Hungary was on the defensive, whereas Russia herself was not threatened. In order to draw up a scale for gauging the responsibility for the war, the following points should be stated: the first assault on the peace of the world was the murder at Serajevo (Serbia–Russia; Austria-Hungary); the second the ultimatum and the declaration of war on Serbia (Austria-Hungary and Germany); the third and the decisive assault was the Russian general mobilization (Russia–France–England). From this it appears that of the Great Powers, Russia was the most guilty: then Austria-Hungary. Moreover, all the Great Powers placed their own interests above world peace; yet only France, Russia and Austria-Hungary had in 1914 definite war aims (Alsace-Lorraine, the Dardanelles, Serbia). It is, therefore, clear, that the Versailles thesis regarding war guilt is entirely untenable.

It was a disaster for Europe, that there was nowhere at the head of the Great Powers an outstanding statesman, able to master the crisis of 1914; for the great mass of the peoples had no desire for war. (H. Lu.)

THE TWO SIDES OF TRUTH

To compare year by year, crisis by crisis, detail by detail, the preceding narratives would serve no good purpose. Monsieur Renouvin concludes that the World War when it came, broke out for two principal reasons. First, because Austria-Hungary was determined at any risk to reduce Serbia to subjection once for all; and to do this in conspicuous defiance of Russia. Second, because Berlin brought no firm restraining influence to bear upon Vienna. Herr Lütz decides that in the ominous decade before the war the Triple Entente obstructed the claims of Germany to a just share of colonial expansion; and, by its pro-Slav policy in Eastern Europe, imperilled the integrity and the very existence of the old Habsburg Double-Monarchy, compelled at last to fight for its life when its maintenance seemed most vital to the future safety of Germany as well. As for the more immediate antecedents of the catastrophe in the summer of 1914, Herr Lütz finds that the Serbian Government was a passive accessory to the murder of the Archduke Franz Ferdinand; that the extreme punitive action resolved upon at Vienna was justified in principle; that Russia, as the first Power to order general mobilization, incurred the blame for precipitating inevitably, a general conflict; but that Austria-Hungary to some lesser extent must be held responsible because of its previous partial mobilization, its resort to the first actual declaration of war (against Serbia, July 28), and its firing of the first shots (July 29) when Belgrade was bombarded.

Part of the French case is that Britain did not give in time a decisive warning to Germany. Part of the German case is that Britain exerted no decisive restraint on Russia. These two deeply contradictory views are, however, charges of weakness or misjudgment against Lord Grey and the Asquith ministry, not charges of "guilt" for disastrous action like Austria-Hungary's to begin with and Russia's afterwards. The former Allies as a whole remain almost unanimously of the opinion that the most fatal influence of all was the disinclination of Germany to modify firmly those suicidal counsels at Vienna which led, in fact, to the total destruction and disappearance of the historic Habsburg monarchy. But even this opinion, however definite, does not—as we shall see—imply any accusation of "guilt," in the sense of conscious, deliberate wrongdoing against William II. and his advisers; much less against the mass of the German people under the conditions of that régime.

Examples of Controversy About Former Wars.—We must all bend ourselves to realize how questions and their merits appeared at the time to others; to antagonists as well as to allies. To bring to bear this just psychology, and equal understanding, is amongst the chief duties and best offices of impartial history. After the wars of former centuries and generations, questions of relative sin and righteousness were the theme of complicated controversies long since dead. In the middle of the 19th century, the moral and legal principles at stake in the small Schleswig-Holstein affair gave rise to a voluminous and now insupportable literature. At an earlier period most English people regarded France as a wicked nation and Napoleon as a bad man. Similar feelings had prevailed in America about George III.—a rigid pattern of intentional virtue—and in France about Mr. Pitt conceived as an evil manipulator of gold against the purest aspirations of humanity. For long after 1871 the popular German view was that France had provoked hostilities by arrogant vanity and aggressive presumption. The ordinary French view was that Bismarck with iron immorality had lured France into war; and that while "old Germany" in its divided state had represented an amiable and virtuous civilization the spirit of "Prussia" was essentially malign. Again when we go back to the origins of modern Europe, we are confronted with the hundred years of religious wars springing out of the Reformation. To attempt now with regard to them a distribution of responsibilities in terms of relative guilt as between different persons, creeds and States would be ludicrous. We know that though material self-interests of all kinds were more and more involved, the deepest motives were spiritual; born out of irreconcilable differences of conviction respecting truth and right, life and eternity.

Not "Guilt" but "True Tragedy."—The characteristic thought of the English-speaking races applies these analogies to the World War. From this standpoint Article 231 of the Treaty of Versailles has no moral weight nor judicial validity. The comparative error or sagacity of different Governments and systems, their degrees of worse or better judgment, remain to be weighed; but the conception of "Guilt," especially as implying a moral stain upon particular nations, entirely disappears. A line in Shakespeare considered by many to be the deepest of all applies singularly to the psychology of nations and races in this sphere: "There's nothing good or bad but thinking makes it so." Burke reminds us that we cannot frame an indictment against a whole people. Hegel said that true tragedy is not a conflict between right and wrong but "between Right and Right." This is accepted as a familiar truth in private affairs, and in party-crises in the same nation such as have sometimes led to civil war. Only the same principle raised to its highest power can explain the origins of the World War—the supreme tragedy of European history.

Five Centuries of Causation.—Let us remember that some of the remoter causes were centuries earlier than any modern responsibility. The results particularly of the Turkish invasion of Europe and of the Reformation wars remained a definite influence upon the European situation at the ominous beginning of the 20th century. Again, the new political forces set up by the French Revolution continued to work by action and reaction.

Nationalism became more and more a dominating impulse bequeathed by the 19th century to its successor. Subject races aspired to freedom and equality; divided races to unity. Older historic systems, thus threatened with disintegration, strove to maintain themselves. In the dozen years between 1859 and 1871 —far-reaching indeed in their effect on the following generations —repeated wars changed altogether the former aspect of Europe; while in the same momentous period occurred the American Civil War and the Japanese revolution. In Italy began (1859–66), the long liquidation of the Habsburg imperial system deriving from mediaeval conditions supplemented later by the partition of Poland. But Italian unity was not yet completed: the recovery of the Trentino from Austria remained a further goal. Above all "by iron and by blood," as Bismarck said, a new German empire was created in spite of France; and on the plea of right as well as that of security, Alsace-Lorraine was annexed by the conquerors.

1871–1890. The Genius of Bismarck's Peace-system and its Collapse.—With this fateful event in 1871 any closer scrutiny into modern responsibilities must begin. Tragedy in Hegel's sense enters here into the soul of European affairs; but there is no question of guilt. The standpoints of these two great nations were opposed, partly unintelligible to each other. In what France thought was a crime, German enthusiasm saw not only historic justice but racial idealism. And also practical necessity. Moltke held that in any case, Germany would have to stand on guard for 50 years. In 1877–78 came a crisis quite equally fateful when Russia in arms began the final liquidation of the old Turkish empire in Europe. The larger part of civilized opinion held that moral right was on the side of Russia as the champion of the Christian races in revolt. But the Turks believed themselves to be doing their duty in defending very bravely what for so long had been their own. This is a typical example of that kind of conflict between dying systems and rising causes which reached its culmination some decades later in the World War. For at the same time, Russian policy, after the victory over Turkey, threatened to open, at no distant remove, a further process of "liquidation" in Austria-Hungary itself. But that process might leave Germany isolated and menaced all round—"Feinde ringsum." Bismarck, for this time, had to join in checking Russia at the Berlin Congress (1878). He had based himself as long as possible on friendship with the tsardom, but its ultimate hostility in conjunction with France was now conceivable. Beset henceforth with reason, by his *cauchemar des coalitions,* the Iron Chancellor formed the Triple Alliance of Germany, Austria and Italy. Austria-Hungary had occupied Bosnia and Hercegovina. These Slav provinces were essential to the coming cause of Serbian nationalism, then young raw and underestimated but to prove in the sequel one of the most passionate and desperate of all nationalisms.

In this way within little more than a decade after the annexation of Alsace-Lorraine most principal motives of the final tragedy already existed both in the west and east of Europe. But Bismarck's aim was peace. He maintained it for another decade with unparalleled dexterity. Humouring France when he could, he yet kept her isolated. He prevented colonial friction with Britain from coming to a breach. Above all, in spite of the Triple Alliance, he repaired "the wire to Petersburg" by the "Re-insurance Treaty." This in effect guaranteed Russia absolutely against Austro-Hungarian aggression in the Balkans, while his earlier instrument guaranteed the integrity of the Habsburg realms against Russian aggression. Bismarck's dismissal in the spring of 1890 by the young German emperor, clever and superficial, demonstrative but weak, bent on a personal régime for which he was exceptionally unfitted—this, in reality, was a more tragic event than the assassination of the archduke nearly a quarter of a century later. At once, every trace of the great chancellor's managing and almost conjuring genius disappeared from the conduct of German policy. To the astonishment of Petersburg the "Re-insurance Treaty" due for renewal at that moment was allowed to lapse. Then the Franco-Russian alliance was formed at last. The most characteristic part of the Bismarckian system of security was thus destroyed. Neither France nor Russia could be blamed at all for resorting to mutual support in these circumstances. Yet the new German policy, abandoning the secret and complicated arrangement with the tsardom, conceived itself as withdrawing from a double game; and undoubtedly meant to be not less but more honest though in truth it was only more crude.

Thus the first fatal misjudgment of the Williamite régime was in a moral sense the reverse of "Guilty."

1890–1907. Anglo-German Antagonism and Diplomatic Revolution.—Next came by degrees the doubly-fatal breach with Britain. The details of that process must be excluded here. The main matter is plain. The new German empire had become a great industrial and commercial power with vital maritime interests and colonial possessions which it regarded as unjustly limited and inadequate by comparison with those of Britain, France, Belgium and Portugal (not to speak of Russia with its vast Siberian extension). Germany, in principle, was absolutely entitled to aim at the creation of a formidable sea-power in addition to its immense military power. It was a matter not of morals but of practical judgment. Britain already was dangerously isolated. Her Government tried through nearly four years (1898–1901) to remedy this untenable situation by repeated efforts at alliance with Germany. Berlin preferred to keep a free hand; but leaned more towards Russia; and unswervingly built up the new fleet while mutual hostility ceaselessly increased between the German and the British peoples. Sea-security to the island was all in all; continued isolation became unthinkable. "Provident fear is the mother of safety." This became a growing thought. Germany could not realize or appreciate the significance of the insular spirit of far-sighted precaution and of reluctant but determined resource.

Between 1903 and 1908 during King Edward's short reign—though his personal influence was no initiating factor—the former diplomatic system was revolutionized in Europe and Asia. Britain allied herself with Japan; then settled all her old controversies with France; and succeeded next in coming to a better understanding with Russia. Thus the Triple Entente of Britain, France and Russia was founded. Not only so. Italy, in these circumstances, could no longer be reckoned upon by Berlin or Vienna. From 1902 she was fairly certain not to act against France or Britain. The destruction of Bismarck's system under his successors was already almost total. For different reasons Britain and Russia were now antagonized as well as France, while Italy still a nominal ally was in reality detached. But William II. and his advisers had no criminal consciousness at any point. They supposed themselves to be acting for the best on behalf of Germany's life and hope. They were only, in political foresight and judgment, as inferior as the Iron Chancellor had been superior.

1908–1913. Fatal Years. Dying Systems and Rising Forces.—We come to the last half-decade before the World War. To speak of "guilt" in connection with the rival forces, inspired by irreconcilable ideas of justification, is an extreme triviality. In 1908 the Young Turk revolution shook the Balkans and altered all prospects in that quarter. Austria-Hungary under Aehrenthal's too emphatic guidance formally annexed Bosnia and Hercegovina occupied without permanent title 30 years before. This to most of the world seemed only a technical or nominal violation of the Treaty of Berlin. In its way it was serious as an arbitrary example. Far worse, Serbian national feeling looking forward to union with those two provinces (since incorporated in Yugoslavia) rose in violent and warlike protest. It was supported by Russia—bitterly disappointed in a recent hope of obtaining by understanding with Vienna her historic aim of free naval communication between the Black Sea and the Mediterranean. At the end of March 1909 Germany's appearance "in shining armour," beside Austria-Hungary, compelled Russia and Serbia to yield—and wait.

This episode was of quite fatal effect. It was not fully understood until the appearance after the war of the memoirs of the Austro-Hungarian Chief of Staff, General Conrad von Hoetzendorff. A new military convention in this spring of 1909 had fettered Germany to the obsolete Habsburg monarchy in a way that would have appalled Bismarck. If that monarchy should

feel itself compelled for the sake of its existence to move against Serbia, it was to be supported by Germany at any cost against Russian interference. From that moment, Vienna—not Berlin—had the initiative. Thus disappeared the last vestige of Bismarck's system of control. But the reason was clear. Now, indeed, it was too plain that the old Chancellor's *cauchemar des coalitions* might become in the next few years the grimmest of realities. The Danubian double-monarchy with its medley of jarring nationalities—subject but rising races forming a majority of its population—was now Germany's last and indispensable ally amongst the Powers. Germans feared now that the further weakening and gradual disintegration of this last ally, Austria-Hungary, would lead to the utter isolation and perhaps the downfall of the German Fatherland itself. This gives the key to the rest of the tragedy.

Events soon took a turn that neither the Wilhelmstrasse nor the Ballplatz had anticipated for a moment when German policy became inextricably entangled with that of Vienna. Contrary to their expectations Turkey was overthrown in 1912 by the Balkan League of Serbia, Bulgaria and Greece. The Serbian victories and territorial gains were from the Austro-Hungarian point of view an almost deadly menace. Had not Mazzini said with a wonderful flash of prophecy more than half a century before, "The Turkish question will be no sooner solved than the Austrian question will be raised." When the Balkan confederates turned their arms against each other in the second Balkan War (1913) Bulgaria went down under attacks by all her neighbours and Serbia was strengthened again. Every disruptive force in the Dual Monarchy was stimulated. Even Rumania ceased to be a friend and threatened to become an enemy with a view to racial reunion with Transylvania where a large Rumanian majority chafed under Magyar rule. When 1914 opened, peace between the Great Powers had been preserved with difficulty. It lasted only for a few months more. The Serb racial agitation threatened—legitimately from the standpoint of all rising nationalisms—the disruption of the Habsburg system. Vienna as inevitably—holding by tradition and conviction an opposite view of rights, loyalties and duties—felt that a struggle to suppress the larger hopes of Serbian nationalism was an approaching necessity of life and death. "Tragedy is not the conflict of right and wrong but of Right and Right"—as variously and irreconcilably judged by mortal seeing before the event.

July 1914. The Explosion of a Continent.—This was the situation when on June 28, 1914, the Archduke Franz Ferdinand and his wife were assassinated by young Bosnian-Serb fanatics at Serajevo, his arrival there for military manoeuvres appearing as an ostentatious threat to the Serb idea. The crime was atrocious. There can be little doubt that the Belgrade Government had scent of the plot and might possibly have averted the murders by more energetic action. But this is not quite sure. Nor does the point touch the real question. Episodes of violent crime have been the common accompaniment of the struggles of subject and divided races for freedom and unity. This has never been held to be a just cause for inflicting the capital penalty upon any national movement as a whole.

But from the standpoint of Vienna, the Habsburg cause was supreme by right, criminally jeopardised, and the occasion uniquely favourable. For the preservation of the Dual Monarchy —Germany's last ally—independent Serbia was to be reduced to insignificance. Berlin agreed—not conscious of "guilt" but, on the contrary, satisfied as to the essential moral justice of the procedure of the two Central Empires; and even unable for some weeks to appreciate any wider view. At Berlin the old dominant Bismarckian spirit of many-sided sagacity and providential precaution no longer existed. Ignoring Russia, Vienna launched its terms of annihilating humiliation upon Belgrade. This unparalleled ultimatum was intensely convinced, but almost insanely rash as seen from the standpoint of any practical desire for the maintenance of general peace. The only real hope for peace was to submit the issue to a European tribunal, such as in a similar crisis, now, would follow as a matter of course from the principles of the League of Nations. Lord Grey's proposals for conference in this spirit were not accepted. Austria-Hungary, when Serbian submission to the unparalleled ultimatum was humble enough but not quite complete, mobilized eight army corps; declared war on Serbia; and on July 29 fired the first shots of the World War by bombarding Belgrade. This procedure, though actuated by a conviction of Right, rested upon a deeply mistaken presumption of Might.

Russia, dreading renewed joint action by the Central Empires, and prepared to face anything rather than submit again to an arbitrary summons to stand aside abjectly, took the desperate course of decreeing general mobilization.

As the world was then arranged, with no accepted international system of peaceful procedure, the tsardom was within its right as a Great Power which could not be expected to remain subject merely to fear. Germany was compelled as a matter of course to mobilize at once, since her own existence might depend on that advantage of rapid efficiency which her whole national system for many years had been organized to gain. No people could be more convinced than were the Germans at that moment that they were standing for their life and that of their last ally, and that they had their quarrel just. France was as fully involved by her own alliance and situation.

Germany, on the plea, and under the conviction, of stark necessity, forced, in accordance with the Schlieffen plan, a military passage through neutral Belgium.

Britain, where otherwise divisions of opinion might possibly have prevented immediate interference, was unavoidably drawn in, at once, by the violation of Belgium. For her also and for her empire the issue of life and death had arisen.

The Moral: "Thinking Made It So."—As has been seen, full agreement, in different countries, between equally dispassionate students, of the facts and documents, is still impossible regarding the relative merits of the causes at stake and the opposite policies pursued. There is no objective standard whereby to measure the inward psychological factors which impelled the external machinery. For half a century, as we know, the rivalry of higher convictions and devotions, as well as of interests in the lower sense, had been tending by a gigantic accumulation of armaments, to this terrible issue and no other. The process as Prince Bülow said long in advance was that of "pressure, counter-pressure, explosion." For over 40 years every step in the working out of the world tragedy led to steps still more ominous. Two things seem especially clear to the present writer. (1) Amongst single personal events and influences the most fatal were the dismissal of Bismarck in 1890; and William II.'s contrasting unwisdom. To him as much as to any figure in history applies Voltaire's word, "fate is temperament." (2) The Habsburg monarchy, now vanished, worked out its own doom. New nationalisms proved as destructive to it as to its former neighbouring empire, Turkey in Europe. The archduke's assassination, exciting universal horror, was a favourable moment for appealing at once to the European Areopagus as Lord Grey entreated later. Instead, relying upon the closer military agreements with Germany since 1909, and reckoning doubtless that Russia would again submit as in that year, Austria-Hungary adopted a one-sided and extreme policy which—apart from the merits then or now of any plea of justification in the abstract—was in fact of all courses open the most likely to lead to a World War and did lead to it. The method and its miscalculations proved self-annihilating.

"Those whom the gods wish to destroy, they first make blind." This comment offers itself. But as against it another great consideration is to be remembered. If the World War had not come when and how it did in 1914 it almost certainly would have broken out within a very few years later and the fate of the "obsolete empire," owing to the increasingly discordant elements in its composition, might well have been the same. Near the heart of the European tragedy lay the truth that the Habsburg monarchy with its medley of 50 millions of people could not survive as it stood; yet could not be transformed except by force from within or without; and could not attempt in earnest to maintain itself without imminent risk of dissolution.

The Disarmament of Minds.—Thus a charge of peculiar

"war guilt" against any one people is null and of no effect. No individual anywhere looks on individual Germans, Magyars, Bulgarians and Turks as members of a culpable race. But why then, it will be asked, should not Article 231 of the Treaty of Versailles be withdrawn formally? This course is for two reasons impossible. First, it would be interpreted and exaggerated as a damaging acknowledgment by the Allies and their Associate. Second any formal proposal to expunge Article 231 would reopen interminable recrimination on war-causes and war-plans—especially the violation of Belgium, and the original moral rights of the new nationalities against former dynasties and State-systems. That controversy, rekindling the fiercest passions, would be the surest means of throwing back the vital work of reconciliation and co-operation. Instead Article 231 is already a dead-letter in the moral sense; and the futility of Article 227 is only remembered with ridicule.

We can say more than this. Involved in an unprecedented world-tragedy arising from thoughts and forces which were in motion long before, the belligerent nations and races, as we have seen, were irreconcilable in their ideas of right and justice, of present safety and future prospects. They were equally disfigured by passions, prejudices and reciprocal abuse. But they were alike not only in war-sorrows and war-heroism but in an unconscious community of service to the future. Mutual slaughter as the traditional last resort, organized on a stupendous scale as an attempted means of political settlement, was shown to be more and more destructive and more and more bestial. Everywhere, the revolt of human feeling and reason against war is a movement incomparably more powerful and systematic than civilization has seen up to now. The magnitude and method of this revolt are together the dominating political fact of our time. The movement is assuredly permanent. Already, it has exerted a profound influence on human institutions and relations. The League of Nations exists. Though its own authority must remain insufficient while America abstains, the Kellogg Pact has been signed on American initiative. It is already improbable that war on any wide scale can break out without conference and prolonged delay.

These remarkable changes largely improve the chances of compromise and diminish danger. For the first time in human affairs there is a practical possibility that lasting international peace may be established; and this gain is one of the greatest facts in history. But the moral advance of civilized thought is stronger still than the imperfect machinery so far devised. In view of the continued development of scientific facilities for promiscuous destruction, all competent thinkers know that—in Europe at least—civilization will abolish war or war will abolish civilization. The idea of a United Europe is more than a dream though as yet only in its beginnings. The best elements in every great country which was engaged in the war turn towards each other with sympathy and appreciation; with increasing comprehension of each other's difficulties and motives in the past; with a desire to co-operate in the future; with an effort for closer understanding in every way. The German people to-day, for instance, stand higher than ever in the respect of all their former opponents. Upon this movement for moral reconciliation the world's hopes depend; for without it, armaments, however temporarily reduced, would return again. (J. L. G.)

WARHAM, WILLIAM (*c.* 1450–1532), archbishop of Canterbury, belonged to a Hampshire family, and was educated at Winchester and New College, Oxford, afterwards practising and teaching law both in London and Oxford. Later he took holy orders, held two livings, and became master of the rolls in 1494, while Henry VII. found him a useful and clever diplomatist. He helped to arrange the marriage between Arthur, and Catherine of Aragon; and he was partly responsible for negotiating treaties with Flanders, Burgundy and Maximilian I. In 1502 Warham was consecrated bishop of London and became keeper of the great seal, but his tenure of both these offices was short, as in 1504 he became lord chancellor and archbishop of Canterbury. In 1509 the archbishop married and then crowned Henry VIII. and Catherine of Aragon, but gradually withdrawing into the background he resigned the office of lord chancellor in 1515, and was succeeded by Wolsey. This resignation was possibly due to his dislike of Henry's foreign policy. He was present at the Field of the Cloth of Gold in 1520, and assisted Wolsey as assessor during the secret inquiry into the validity of Henry's marriage with Catherine in 1527. Throughout the divorce proceedings Warham's position was essentially that of an old and weary man. He was named as one of the counsellors to assist the queen, but, fearing to incur the king's displeasure and using his favourite phrase *ira principis mors est*, he gave her very little help; and he signed the letter to Clement VII. which urged the pope to assent to Henry's wish. Afterwards it was proposed that the archbishop himself should try the case, but this suggestion came to nothing. He presided over the Convocation of 1531 when the clergy of the province of Canterbury voted £100,000 to the king in order to avoid the penalties of *praemunire*, and accepted Henry as supreme head of the church with the saving clause "so far as the law of Christ allows." In his concluding years, however, the archbishop showed rather more

independence. In February 1532 he protested against all acts concerning the church passed by the parliament which met in 1529, but this did not prevent the important proceedings which secured the complete submission of the church to the state later in the same year. Against this further compliance with Henry's wishes Warham drew up a protest; he likened the action of Henry VIII. to that of Henry II., and urged Magna Carta in defence of the liberties of the church. He died on Aug. 22, 1532 and was buried in Canterbury cathedral. Warham was chancellor of Oxford University from 1506 until his death.

WARKWORTH, town of Northumberland, England. Pop. (1921) 1,042. It is situated on the river Coquet, 1½ m. above its mouth, where on the south bank is Amble, an urban district (pop. 4,851), with a harbour. An ancient bridge crosses the river, with a fortified gateway on the road mounting to the castle. The remains of this Norman stronghold include walls, a gateway and hall; while the Lion tower and the keep are of the 13th and 14th centuries. Near by are remains of a Benedictine priory of the 13th century, and also the Hermitage of Warkworth, which consists of an outer portion built of stone, and an inner portion hewn from the steep rock above the river. This inner part comprises a chapel and a smaller chamber of the 14th century, being late Decorated.

WARLOCK, a word seemingly used in northern English or Scottish for a wizard, sorcerer or magician (*see* MAGIC); in O.Eng. *wǒerloga,* literally "a liar against the truth," from wǒer, truth, cognate with Lat. *verum* (*cf.* Ger. *wahr*), and *loga,* liar, from *léogan,* to lie (*cf.* Ger. *lügen*). It was used for a traitor, deceiver, breaker of a truce. In M.Eng. it is a name for the devil (*warloghe*), the arch liar and deceiver.

WARMINSTER, a town in Wiltshire, England. Pop. (1921) 5,387. Its white stone houses form a long curve between the uplands of Salisbury plain, which sweep away towards the north and east, and the tract of park and meadow land lying south and west. The cruciform church of St. Denys has a 14th-century south porch and tower.

Warminster appears in Domesday, and was a royal manor. The meeting of roads from Bath, Frome, Shaftesbury and Salisbury made Warminster a busy coaching centre. Eastward, within 2 m., there are two large ancient camps: Battlesbury, almost impregnable save on the north, where its entrenchments are double; and Scratchbury, a line of outworks encircling an area of some 40 acres, with three entrances and a citadel in the midst. Barrows are numerous. Longleat, a seat of the marquesses of Bath, lies 5 m. south-east, dating from the close of the 16th century.

WARNER, CHARLES DUDLEY (1829–1900), American essayist and novelist, was born of Puritan ancestry, in Plainfield (Mass.), Sept. 12, 1829. His childhood experiences in Charlemont (Mass.), after the death of his father, are pictured in his delightful study *Being a Boy* (1877). The family removed thence to Cazenovia (N.Y.); and Warner graduated in 1851 from Hamilton college, Clinton (N.Y.), through which he had paid his way by his earnings. Because of ill health, he spent some time with a surveying party in Missouri.

When he was 40 years old a series of sketches published in the *Courant* changed him from an editor with a local reputation to a nationally known man of letters. They were published in book form as *My Summer in a Garden* (1870). Thereafter Warner's work appeared frequently in the better class magazines. He travelled widely, and wrote several travel books, the best of which are *My Winter on the Nile* (1876), originally called *Mummies and Moslems,* and its sequel *In the Levant* (1876). With his friend and neighbour, Mark Twain, he collaborated on *The Gilded Age* (1873), an uneven novel which was unsatisfactory to both men. Another story, *Their Pilgrimage* (1886), had as its purpose the description of fashionable American resorts; and the making, fraudulent diversion from its intended object, and final loss of a great fortune were treated in an ambitious trilogy, *A Little Journey in the World* (1889), *The Golden House* (1894) and *That Fortune* (1899). Warner is at his best, however, as an essayist. He also edited the "American Men of Letters" series, which he opened with a biography of Washington Irving (1881). He died in Hartford Oct. 20, 1900.

See the biographical sketch by T. R. Lounsbury in the *Complete Writings of Charles Dudley Warner* (1904) and Annie Fields's *Charles Dudley Warner* (1904).

WARNER, SETH (1743–1784), American Revolutionary soldier, born in Roxbury, Connecticut, May 17, 1743. He removed with his father to the "New Hampshire Grants" in 1763, and became prominent among the young men who forcibly resisted New York's claim to the territory. (*See* VERMONT.) At the outbreak of the War of Independence, he led the detachment of "Green Mountain Boys" which captured Crown Point, May 11, 1775, and took part in the unsuccessful expedition against Quebec later in the year. In July 1776 he became colonel in the Continental Army, and served throughout the war. He retired in 1782, and returned to Roxbury, where he died Dec. 26, 1784.

See Daniel Chipman, *Life of Col. Seth Warner* (1858).

WARNSDORF, a frontier town in north-east Bohemia, Czechoslovakia, with large textile manufactures, chiefly cotton and silks. Pop. (1921) 20,328, of whom 18,237 were Germans.

WAR OF 1812, THE. As early as 1806 much friction arose over what President Madison characterized as a "sweeping system of blockades" adopted by British Orders in Council with the object of cutting off essential French supplies by sea. This and similar subsequent war measures greatly hampered lucrative American commerce with France and produced the customary deadlock between the inherent interests of belligerent and neutral.

Hostilities.—The American President represented that British blockade methods widely overstepped legal limits, and constantly opposed them through diplomatic channels. In his message to Congress in June 1812, urging a declaration of war, he stated that "British cruisers have also been in the practice of violating the rights and peace of our coasts. They hover over and harass our entering and departing commerce . . . under pretended blockades without the presence of an adequate force [legally required] . . . our commerce has been plundered in every sea." Ill-feeling had been further aggravated by the forced "impressment" into the British navy of men from the crews of American ships met on the high seas. These practices had led to the encounter between the U.S. frigate "Chesapeake" and H.M.S. "Leopard" in 1807, and to that between the American frigate "President" and H.M.S. "Little Belt" in 1811.

The war, declared by Congress on June 18, 1812, followed three distinct phases. Until the spring of 1813 England was hard pressed in Europe, and endeavoured by diplomatic negotiations to stop the war in America, where she could not afford to send reinforcements to her army nor to concentrate large naval forces. Consequently this was a period when the Americans were free to undertake an invasion of Canada and when their very small navy of 16 vessels was able to cruise extensively against British maritime commerce. The second phase lasted about a year, during which England, though still considerably restrained by affairs in Europe, was able to institute a rigorous commercial blockade of the United States coast but could not materially increase her troops in Canada. The third and final phase of the war came after the downfall of Napoleon in the spring of 1814, when England could spare considerable army reinforcements for the American theatre, and further strengthen the naval blockade there.

Three days after the declaration of war, the U.S. squadron under Commodore Rodgers sailed from New York with the double object of protecting the great numbers of American merchant ships then due from overseas, and of preying upon British commerce. After chasing the British frigate "Belvidera," which escaped into Halifax through throwing overboard much of her equipment, he made an extensive sweep of the North Atlantic, almost to the English channel, but captured few prizes. In July Commodore Hull sailed from Chesapeake bay in the "Constitution," and reached Boston after a long chase and narrow escape from a British squadron, through towing the ship with her own

boats. Within a few days he was again at sea and on Aug. 19 captured the British frigate "Guerrière." In October, Rodgers, Decatur and Bainbridge, sailed from Boston in the "President," "United States" and "Constitution" respectively, and made wide sweeps of the mid-Atlantic. The first named met with little success. On the 25th the "United States" captured the British frigate "Macedonian" in long. 30°, and on Dec. 28 the "Constitution" captured the frigate "Java" off the coast of Brazil.

Operations in Canada.—In view of the great general superiority and prestige of the British navy the American people were much elated over these results at sea. From a purely military-naval point of view they were of little consequence, since their effects upon British trade and dominating naval power were negligible. But in upbuilding the American national *morale*, notwithstanding distress caused by the blockade, the frigate victories assumed great importance. Meantime the course of the war on land, where American forces had been greatly superior in numbers, was discouraging. The paucity of British military forces in Canada had led the Americans from the outset to undertake an early invasion across their northern frontier. But a mere handful of British regulars, supported by Canadian militia and Indian allies, and utilizing their initial naval control of Lakes Erie and Ontario, were sufficient to defeat the invaders.

General Hull's advance into Canada from Detroit proved so abortive that he soon returned to his base and surrendered it to Gen. Brock in Aug. 1812. A few months later the energetic and skilful Brock repulsed weak American attempts to establish themselves on the Canadian side of the Niagara river. Meantime a force under the American Gen. Dearborn had been mobilizing near Lake Champlain but its operations were apathetic, in part due to an armistice while fruitless peace negotiations initiated by the British were in progress.

Naval Operations.—The first year's experience on the lake frontier where roads were extremely primitive, clearly emphasized the importance of naval control thereon if the armies were to be supplied and made mobile. During the succeeding winter and spring both sides were very active in the construction and equipment of ships. Commodore Chauncey was in general charge of such American preparations on Lakes Ontario and Erie, assisted in the latter case by Commodore O. H. Perry. Comparatively large naval forces came into being on Lake Ontario. Its control was fought for, notably on Aug. 10 and Sept. 28, 1813, but never decisively gained by either side.

In the early spring of 1813 while still in naval control of Lake Erie, the British military forces in occupation of the vicinity of Detroit invaded northern Ohio and during the summer penetrated as far as the Sandusky river. Their fleet under Capt. Barclay was decisively defeated by Commodore Perry on Sept. 10. While the American fleet was somewhat stronger, great credit is due to Perry for his energy in preparing it under much difficulty, and in conducting the battle with marked spirit and determination. After his own flagship "Lawrence" had become disabled, from having borne the brunt of the fighting, and defeat seemed imminent, Perry went by small boat to the "Niagara," took her into close action and turned the tide of victory.

The event strikingly demonstrated the value of the naval control of the lake. The British army, faced with the severance of its line of supplies, was forced to a hasty evacuation of Ohio and Michigan, and a retreat up the Thames river towards Lake Ontario. The American army under Gen. Harrison was taken on board Perry's ships, so soon as repaired, and landed in Canada, where it pursued the British and defeated them at the battle of the Thames, in which Perry led the decisive charge. Thus the Americans had gained all territory west of the Niagara peninsula.

Meantime, with the advent of 1813, the war had entered its second phase at sea. Overwhelming British naval forces instituted such a vigorous commercial blockade of the coast south of New England, as seriously to affect American commerce, both coastwise and foreign. Considerable clandestine exporting was permitted in order to facilitate the supply of British armies in Spain and Canada, and this also furnished a reason for not extending the blockade to include New England. Strong British squadrons occupied Chesapeake and Delaware bays, and closely guarded all ports from Maine to Georgia against the passage of war ships.

Commodore Porter in the frigate "Essex" had been operating in the South Atlantic, and instead of attempting a difficult return to the United States decided upon a voyage into the Pacific to raid the valuable British whaling trade, while at the same time protecting that of the United States. In both objects he was very successful. After refitting at the Marquesas islands, which he annexed to the United States by treaty (not confirmed by his government), he proceeded to Valparaiso to meet a British squadron of whose coming he had received information. Here in March 1814, he was attacked and defeated in Chilean territorial waters by the more powerful "Phoebe" and "Cherub." Meanwhile during 1813, the "President" and "Congress" had made an all but profitless sweep of the Atlantic, the frigate "Chesapeake" had been captured off Boston by H.M.S. "Shannon," and the U.S. sloop "Argus" taken by the "Pelican" off the coast of Wales.

The Third Phase.—The fall of Napoleon in the spring 1814 brought the war to its final phase by permitting England to augment greatly her military and naval forces in America. At the beginning of the year the Americans still retained the initiative on land, by virtue of superior numbers on the Canadian frontier. Moreover the handicap of poorly disciplined troops had been largely overcome. During a brief campaign against the ill-chosen objective of the Niagara peninsula Gen. Brown met with considerable success at the battles of Chippewa and Lundy's Lane. But the failure of Commodore Chauncey to deny the use of the lake for carrying supplies and reinforcements to the British army brought the invasion to a close in July. The constant arrival of fresh British regulars, together with increased naval forces which extended and strengthened the blockade and penetrated into all the large coastal bays, enabled them to take the offensive in several quarters. Northern Maine was occupied by light forces and held until the end of the war. In August Gen. Prevost, at the head of a veteran army of about 12,000 men, based at Montreal, invaded New York via Lake Champlain, bound for the Hudson valley. In the same month a large British squadron ascended the Patuxent river and landed 4,000 regular troops under Gen. Ross who, almost without opposition, marched to Washington and burned the capitol. This raid had little result except to inflame public hatred against the British. The expedition proceeded to Baltimore where its attack was repulsed on Sept. 12. During the attack Francis Scott Key composed the "Star Spangled Banner." Gen. Ross was killed. The same forces then sailed for the Gulf of Mexico where they undertook the capture of New Orleans in December. Of these operations the advance from Montreal was not only the largest but also threatened the gravest consequences. One of the essential conditions of its success lay in control of water communications on Lake Champlain, in order that the invaders might be readily supplied from the St. Lawrence river. On this account, the victory of the American squadron under Commodore Macdonough, over the British squadron acting in support of the invading army, was of outstanding strategic importance. This occurred off Plattsburg on Sept. 11, 1814, while the American army at that place was about to be assaulted in its works by superior British land forces. The brilliance of Macdonough's triumph is heightened by the fact of his fleet having been somewhat weaker in tactical elements than that of his opponent, and by the immediate reversal of events on shore. On learning the outcome of the naval engagement the British Gen. Prevost abandoned his attack on Plattsburg and retreated.

During 1814 the increasingly effective blockade together with an American embargo virtually put a stop to American sea-borne commerce, domestic and foreign, and consequently brought about widespread economic depression. The price of salt rose to $5 per bu., that of sugar to $26 per cwt., and specie reached a premium of 22%. Exports fell to a total of $7,000,000 as compared with $45,000,000 in 1811—a year of restricted commerce. Most of the American navy was forced to remain in port and the few ships which eluded the blockade found that the British system of convoying trade under naval escort substantially reduced captures. The most notable actions of the year were the previously men

tioned loss of the U.S.S. "Essex," the capture of the British brigs "Reindeer" and "Avon" by the "Wasp," and the victory of the American brig "Peacock" over the "Epervier."

The stagnation of American commerce stimulated the employment of large numbers of merchant ships as privateers, and during the last six months of the war their operations constituted the principal American offensive on the sea. Many prizes were taken and the alarm created in British shipping circles increased insurance rates to double those prevailing during the Continental wars. This situation, together with the failure of the projected invasion of the United States through Lake Champlain, and post-war conditions in Europe, were the primary influences towards causing a British desire for peace, the treaty for which was signed at Ghent on Dec. 24, 1814.

Hostilities After Treaty.—The slowness of communications at that period was responsible for the continuation of hostilities for several months thereafter. Early in December the British military-naval expedition bent upon the capture of New Orleans landed on the Gulf coast at Lake Borgne. They advanced to the Mississippi river, where Gen. Jackson had erected entrenchments, which were supported by a naval squadron under Commodore Patterson. By successive stages the British got within three miles of the city; but on Jan. 8 their assault was decisively beaten with a loss of 2,000 troops including Gens. Peckenham and Gibbs. The victory, though it occurred after the treaty of peace had been signed, had important consequences in further stimulating the American national spirit. In Jan. 1815 the frigate "President" attempted to gain the sea from New York harbour, but was captured by the blockading fleet. A few weeks previously the "Constitution" had succeeded in escaping out of Boston, and in February, while off Madeira, she captured the "Cyane" and "Levant" together. The final action of the war was the capture of the British sloop of war "Penguin" by the "Hornet" on March 23, 1815.

The British invasions of Michigan, Ohio and New York, which might have resulted in important territorial gains, failed by reason of naval defeats on the Lakes, and their threat against the Louisiana territory was nullified at New Orleans. The issue of "free trade and sailor's rights" which caused the American declaration of war, did not gain recognition in the treaty of peace. It nevertheless became an established political doctrine to which the United States has since firmly adhered. The American attack on British commerce, except for the privateering operations, was on too small a scale to influence the course of the war. The frigate victories, incidental to commerce raiding, had little military effect, but may be regarded as important political successes, in view of their elevation of the national *morale* notwithstanding the widespread economic distress caused by the overpowering British blockade. To America the War of 1812 brought about a much needed national unification.

WAR OFFICE[1]. (*a*) The building which houses the controlling staff of the army, and (*b*) the controlling staff itself.

(*a*) As regards the local habitation of the staff, in Cromwellian days this was often in the field and was the tent of the secretary to the commander-in-chief whose official title was *Secretary-at-War*. After the Restoration (1660) Monk, as lord general, took up his residence at a house in Whitehall called the Cockpit (which had formerly been used for cock-fighting) and this became the headquarters of the army. Numerous warrants and letters of the early days of the present standing army are dated from "the Cockpit at Whitehall." About 1684 the headquarters were moved to the "Horse Guards," that is the barracks of the King's Guards at Whitehall, and here it remained until 1856 when it moved to Buckingham House, Pall Mall. In 1907 it finally moved to its present quarters in Whitehall immediately opposite the Horse Guards.

[1]The permission of the Controller of H.M. Stationery Office has been obtained to the inclusion of this article.

(*b*) (i)[2] **From the Earliest Times to the Crimean War (1854–56).**—The details of the early administrative history of the army are very obscure. William the Conqueror created the offices of high constable and marshal and their duties appear to have been somewhat analogous to those of the present day adjutant-general and quartermaster-general.

Although the origin of the Board of Ordnance is obscure it was certainly in existence in the early part of the 14th century, and it is the oldest military office with a continuous history. Charles II. created the title master-general of ordnance in 1664 and this still survives. The headquarters of the Board were for centuries at the Tower of London. In 1855 the Letters Patent for the Board were revoked and its duties vested in the *Secretary of State for War*. In the 18th century, the office of master-general of the ordnance was held by the chief military leaders and generally carried with it cabinet rank. Marlborough was twice master-general of ordnance.

The office of Secretary of State for War appears to have had its origin in a *Council of War* of Charles I. During the Cromwellian period the army was managed by a *Parliamentary Committee of the Army*. The clerk to Charles' Council was the *Secretary-at-War* and he had a counterpart in the New Model. After the Restoration he became *Secretary-at-War to all the Forces in England and Wales*, and was in fact nothing more than the private secretary of the commander-in-chief. When Monk (duke of Albemarle) died in 1670 the office of *Secretary-at-War* grew in importance owing to the fact that Charles II. did not appoint a successor as commander-in-chief. Gradually the office became separated from that of the commander-in-chief, arriving at complete divorcement in 1704, when the office became a political post. In 1794 was created a new post, the *Secretary of State for War*, and in 1801, because the armies were largely employed in the West Indies, the direction of Colonial affairs was transferred from the Home Office to the Secretary of State for War who became *Secretary of State for War and the Colonies*. In 1855 the office of *Secretary-at-War* was merged into that of the *Secretary of State*, but it was not finally abolished until 1863.

The office of the Deputy Secretary-at-War appears to have been created at least before the 18th century. The holder of the appointment was the senior permanent official in the department of the Secretary-at-War. When the departments of the Secretary of State and Secretary-at-War were amalgamated the post was abolished and in its place that of *Permanent Under Secretary of State* created. In 1904 the title was changed to "Secretary of the War Office," but reverted to "Permanent Under Secretary of State" in 1924.

The office of the Commander-in-Chief dates back to the Restoration. At various times the title has been Captain General, Generalissimo, General on the Staff and Lord General. The first holder of the appointment was the duke of Albemarle whose special charge was the care of men while the Board of Ordnance looked after the material. In the 17th century when the C.-in-C. was on foreign service, many of his duties were usurped by the Secretary-at-War.

The office of Adjutant General to the Forces originated in the Parliamentary Army. After the Restoration the first appointment was made in 1673. From 1685 there has been a continuous line of Adjutants-General.

The Quartermaster General first appeared in 1686. Previous to this his duties had been carried out by the Provost Marshal, Scout Master General and the Harbinger.

An important office in army administration was that of *Commissary-General of Musters*. His chief duty was to keep up the establishment and to issue a certificate to the Paymaster-General for the actual number of men serving. The office was established just after the Restoration and abolished in 1818.

At the outset of the standing army the *medical service* was entirely regimental, but in 1663 was initiated central control which gradually developed into a directorate in the early part of the 19th century. Originally the provision of barracks was the business of the Board of Ordnance, but the need for extensive

[2]Based on information contained in *The War Office List*, 1927.

building in 1793 was responsible for the creation of the office of *Barrack-Master-General.* This office was, however, abolished in 1822 and the Board of Ordnance once more assumed the duty of providing and furnishing barracks.

In 1714 was constituted a *Board of General Officers* whose duty was to settle all financial disputes between colonels, officers and soldiers, and matters of precedence among regiments. With the creation of the Commander-in-Chief's office in 1793, the Board was shorn of much of its power which was now practically confined to matters concerning clothing. The secretary of the Board was the Judge-Advocate-General.

(ii.) **From the Crimean War, 1854, to Aug. 1914.**—Military administration underwent great changes during the period following the outbreak of the Crimean War. The duties of the *Secretary of State for War* were divorced from those of the Colonies: the Commissariat Office was transferred to the War Department; the office of *Secretary-at-War* was merged into that of the Secretary of State; the Board of General Officers and the Medical Department were absorbed by the War Department, and the War Department now became known as the *War Office.*

The military control still remained in the hands of the Commander-in-Chief, while the Secretary of State was responsible to Parliament. However, under the War Office Act (1870) the final welding was effected and the Secretary of State became responsible for every branch of military administration.

The next great change took place in 1904 by the creation of the *Army Council* by Letters Patent, consisting of four military and three civil members and a secretary. The President of the Army Council is the Secretary of State for War; the Chief of the Imperial General Staff is the 1st military member, the Adjutant-General the 2nd, the Quartermaster-General the 3rd and the Master General of Ordnance the 4th. The other civil members are the Parliamentary Under-Secretary of State for War (vice-president of the Council), the Financial Secretary of the War Office (finance member) and the Permanent Under-Secretary of State for War is the secretary of the Council. The creation of the Army Council abolished the office of the Commander-in-Chief.

The creation of the Territorial Force in 1908 led to the creation of a Director-General of the Territorial Force.

(iii.) **From the Outbreak of the World War, Aug. 1914, to the Armistice, Nov. 11, 1918.**—The rapid expansion of the forces and their requirements and consequential effects of all kinds brought into being four separate ministries, viz., the Ministry of Munitions, Ministry of Pensions, Air Ministry and Ministry of National Service. The latter took over from the Adjutant-General the duty of recruiting for the army.

During the war the Army Council was increased by the following members:—*Military*—Deputy Chief of the Imperial General Staff, Director-General of Military Aeronautics (who ceased to be a member on the creation of the Air Ministry) and the Permanent British Military Representative at the Supreme War Council, Versailles: *Civil*—the Director-General of Movements and Railways and the Surveyor-General of Supply.

(iv.) **Since the Armistice.**—The cessation of hostilities and eventual peace, whilst causing a cessation of activity in certain directions connected with fighting, created activity in matters connected with demobilization, disposal of prisoners of war, issue of medals, repatriation, and everything to do with casualties. To meet the needs of the times the War Office organization was constantly adjusted. The most important change that has taken place is the transfer to the Master-General of Ordnance from the Quartermaster-General all matters connected with research, experiment, design, manufacture, etc., relating to stores, including mechanically propelled vehicles of all kinds (with a few exceptions).

The corresponding government department in the United States is the War Department, a description of which will be found under Government Departments, section United States.

(T. J. E.)

WARP AND WEFT. Warp threads are those which run lengthwise of the fabric; weft threads run transversely. In the actual manufacturing of practically all kinds of woven textures, there is a considerable difference between the two: (1) The raw material from which warp is made is almost invariably of a higher grade than that used for weft. (2) The number of turns per inch or the "twist" in warp threads usually exceeds the twist in the weft threads or picks. (3) Multiple-fold or multiple-ply yarns (two or more single threads twisted together) are more often used for warp than for weft. (4) Coloured threads appear in both, but much more frequently in the warp than in the weft. (5) The fibrous material from which warp threads are made may be the same as that used for the weft threads, or the two may be of entirely different kinds. (6) Warp threads are often starched or sized, but weft threads are seldom treated in this way.

With the exception of knitted fabrics or other similar structures in which one series of yarns only is used, the warp and weft threads interweave together, not only to form the structure of the fabric but also to adorn it with more or less complex designs. (*See* WEAVING.)

WAR PENSIONS. First Period—Prior to 1592–93. The war pension—which is here taken as covering any grant made in recognition of disablement sustained in the fighting forces—first appears as a purely voluntary grant at the goodwill of the particular war captain or overlord who led a company, or commanded a ship. The commonest form of grant is thus naturally a gratuity on discharge, though the territorial system of the feudal levy obviously provided the means of continued support or assistance in cash or kind where necessary. The monastic houses and charitable endowments of the Church helped substantially in the same direction. The dissolution of these establishments and the dispersal of their endowments, together with the final break up of the feudal system in the 16th century, left the disabled soldier entirely dependent on his former commander. Captains of forces in the Low Countries in Elizabeth's day complained that they were expected to make provision for the sick and wounded "whose charge has laid heavily on them" and the queen "is troubled whensoever she takes the air by these miserable creatures." Accordingly in the last ten years of her reign a series of acts was passed making definite provision by statute for the first time for disabled soldiers and seamen.

Second Period 1592–1681.—The first of these acts recognised the claim of the soldier or seaman maimed "in the service of Her Majesty and of the State" and provided also for those who, though not maimed had served for 20 years or were incapacitated. Building on past precedent, as well as on the newly amended system of rating for the relief of the poor, the act laid on the locality of the man's enlistment the obligation of providing the pension. The amount of a pension was not to exceed £10 a year for a private soldier, nor £15 for an officer, the award to be made by the justices in Quarter Sessions, and paid out of the proceeds of rates levied at amounts ranging from a minimum of 2d a week to a maximum of 10d. a week on every householder. A special county official, the "treasurer for maimed soldiers," was made the recipient of the rates collected and the paymaster of pensions. Concurrently with the payment of pensions on these lines, a substantial number of men were provided for in "alms-rooms" or almshouses, local charities attached to cathedrals or the relics of charitable foundations left on the dissolution of the monastic houses. In London the disused palaces of Ely House and the Savoy were made to house a substantial number of disabled and discharged men.

This system can never have been altogether satisfactory. Local obligations were unequally fulfilled, payments were irregular and no effective central control existed to make the system work. But, except for a brief interval during the Protectorate when pensions were made payable from national funds, largely from the sequestrated property of Royalists, the system lasted until some years after the Restoration. The recognition of a standing army, for which parliament annually voted regular supplies, then compelled equal recognition of the claims of the disabled as a matter for central administration. Whether on the analogy of Louis XIV.'s Hôtel des Invalides, or on the precedent of the local hospitals or hostels which, as we have seen, had been used for the housing of disabled soldiers and seamen in all parts of the coun-

try, national provision for the disabled took the form of large central "hospitals" (*i.e.*, in the modern sense, hostels). The result was the foundation of Chelsea and Kilmainham for ex-soldiers and Greenwich hospital for ex-seamen.

Army Pensions: 1681–1914.—In 1681 Charles II. announced his intention to erect a hospital for disabled soldiers and endow it with revenue. Contributions were invited from the public, the king himself heading the list with a substantial grant, but recourse had soon to be had to other means. Funds were found by deduction from the pay of the troops—poundage as it came to be known—both for the cost of construction and maintenance of the hospital and for some part of the cost of pensions, but at a very early date parliament had to supplement these funds, and finally, though not till 1831, when all deductions were finally abolished, took over the entire cost. The control of the hospital and the administration of pensions to the disabled ex-soldier was entrusted to commissioners, of whom the Paymaster General of the Forces is always one, appointed by the Crown under letters patent. The duty of awarding the pensions both for long service and disablement to all non-commissioned ranks was, and continues to be, entrusted to the commission by royal warrants over the king's signature, awards being made at their discretion subject to the terms and conditions laid down in the warrants. The award of pensions to officers, and later to widows and dependants was retained by the War Office, acting also under warrant.

The pension system contemplated was at the outset essentially one of maintenance in a hospital, but in 1685 it was provided that the disabled should receive allowances out of the hospital's funds until they could be accommodated within it. With the recognition of the out-pensioner the in-pensioner of the hospital becomes a special class rather than the normal type. Within a few years, especially after the campaigns in the Low Countries, the number of the disabled increased to a point far beyond the accommodation of the hospital, which originally provided for 476 men and has never exceeded 558. By 1713 the out-pensioners had increased to 4,364: and by the middle of the 18th century they numbered 9,700. The early warrants contemplated the grant of pensions to those only who either (a) were wholly disabled for further service by wounds or injuries, those more slightly disabled being given gratuities, or who (b) had served 20 years. The rates of pension ranged from 5d. a day for a private to 1s. 6d. for a corporal of horse. The disability pensions were at flat rates according to rank, and without regard to the extent of disablement, the awards being made by the commissioners without examination of the men and solely on the strength of certificates from commanding officers. The natural result was in a few years a heavy pension list, and increasing demands on parliament, with the result that in 1713 the commissioners made a complete re-examination of all cases and struck off the pension list all—about one half the whole number—of whom they were satisfied were wholly able to support themselves. At the same time the pension rate was reduced to a uniform 5d. a day for all ranks. Complaints on the part of the pensioners and ex-pensioners were general but the principle of a uniform pension rate was adhered to until 1806.

The warrant of 1806 and the act of that year revolutionized the system of pensions. Henceforth disability pensions assume two permanent characteristics. The pension becomes a definite reward of service, in so far as whatever the degree of disability the pension may be varied according to the length and distinction of the man's service and his character as a soldier; at the same time pensions tend to approximate to civil compensation, in so far as they are granted, not, as before, simply on the fact of incapacity for further military service, but on physical disablement "caused in and by service"; and on the basis, not, as before, of a flat rate, but at a rate proportionate to the extent of the injury and to the ability of the man to provide for his own livelihood. The grant of a pension, and the determination of its amount are wholly at the discretion of the commissioners within the minimum and maximum limits set by the warrants.

On these lines the warrants of the 19th century developed, though, so far as rates of pension are concerned, with extraordinarily little change. The maximum rate for disablement rises only from 14s. a week to 17s. 6d. The distinction between the scales of pension available for disablement due to "wounds or injuries received in action" and other disabilities—the latter being compensated at far lower rates—is gradually modified by the recognition of climatic disease, though not finally removed till after the South African War. The basis of pension remains disablement "in and by" service and was very strictly interpreted until the World War. A widow's claims go unrecognized, except by the grant of gratuity equal to 11 months' pay of her husband until the Crimean War and then small pensions are only granted out of the funds raised by the Royal Patriotic Fund Corporation, supplemented by the unclaimed residue of the Soldiers Effects Fund handed over by the War Office. Not until the South African War are pensions provided for widows out of public funds by the War Office.

Pre-World War Pensions.—The scale of pensions in broad outline as it existed immediately prior to the World War may be stated as follows:

	Per week	
	From	To
I. Permanent pensions to men discharged as unfit for service on account of—		
1. Wounds or injuries or sunstroke received in action, or in performance of military duty, or on account of blindness caused by military service or of disease due directly and wholly to war service, pension to be according to degree of injury, length of service, character, etc.	s. d.	s. d.
(a) Total disablement	10 6	17 6
(b) Partial disablement	3 6	10 6
2. Other disabilities caused by military service with at least 14 years' service.		
(a) Total disablement	10 6	17 6
(b) Partial disablement	3 6	10 6
II. Temporary pensions for men with less than 14 years' service—		
(a) Climatic diseases	3 6	7 0
(b) Other disabilities than those referred to under I. (1)	3 6	4 8
The amount of the pension to be according to man's capacity to earn a living and the length and character of his service.		
III. Pensions for men found after discharge incapable of earning a livelihood.	At rates not exceeding those applicable at date of discharge	
IV. Widows whose husbands were killed in the performance of duty, or died of wounds or injuries received in performance of duty within seven years from receipt of wound or injury; or died of disease medically certified as contracted or commencing while on active service within seven years of removal from duty on account of such disease	10s. 0d.	
Children of widow—each child	2s. 0d.	

Naval Pensions: 1695–1917.—Provision for disabled seamen was made by William III. on the same lines as had been applied by his predecessors to ex-soldiers, namely, on the plan of maintenance in a hospital. The plan of Greenwich hospital was initiated in 1695 and the building was opened in 1705 "for the relief and support of seamen . . . who by reason of age, wounds or other disabilities shall be incapable of further service at sea and be unable to maintain themselves and also for the sustentation of the widows and maintenance and education of the children of seamen happening to be slain or disabled in such sea service." The Admiralty adhered to the in-pension system more successfully than the Chelsea commissioners and, though the out-pension system had to be admitted in 1763, the accommodation of the hospital was continually expanded until, at the beginning of the 19th century, in-pensioners numbered 2,710. The out-pensioners however, once allowed, more than kept pace in numbers with the development of the hospital and numbered about 12,000 at the same period. The in-pensioner establishment remained popular, and until the middle of the 19th century there were few vacancies. But thereafter the terms of out-pension were im-

proved and the in-pensioners steadily declined in number, until it was thought to be more economical to offer out-pensions to the whole establishment and in 1869 the hospital was closed to fresh admissions.

The out-pension rates for the sea service—which is administered by the Admiralty itself, not by the commissioners of the hospital—followed very closely the terms of army warrants and it is unnecessary to detail the various stages of their history. The rates immediately prior to the World War were for total disablement from 10s.6d. to 14s.0d. a week; and for partial disablement, which was graduated in three stages, from 3/6d. to 10/6d. a week. The widow and child were eligible for the same terms as in the army service. The naval disability pension like the army pension was subject to variation according to length and character of service, but the regulations provided for several additions to pension for good conduct badges and medals.

Officers of Both Services.—Pensions for disabled officers have, since their first appearance as a charge upon public funds, been based on the recognition of the professional status and prospects of the officer. Pension is thus based on the half of the pay of the rank held by the officer at retirement subject to variation in accordance with the length of his service. An additional consideration for severe wounds received in action, known as "wound pension" (maximum £108 a year) was devised in 1812 and was maintained up till the end of the World War, being permitted to be drawn in addition to half pay. The rate of disability pension for officers up to the rank of major was £200 with a deduction of £10 for each year of service short of 20 years, subject to a minimum of the half-pay rate (which for a 2nd lieutenant might be £54 a year). For naval officers a slightly different system obtained. If the disabled officer was under 40 years of age he received the half-pay rate; if over 40 a rate graduated according to age and length of service but not exceeding the pension due to him on voluntary retirement.

Pension for officers' widows, the provision for which as a public charge goes back to the 18th century, varied according to the circumstances of the husband's death, death in action carrying a higher rate than injury or illness on duty. The rates in operation prior to the World War were, for the widow of a 2nd lieutenant, £80 a year in the former case and £40 in the latter.

World War: 1914–1921.—The World War changed the whole outlook on pensions. Within a few months of its outbreak the regular forces, even with the addition of the territorial army, were trebled in numbers by voluntary enlistments and, with the enactment of compulsory service in 1916, the army became a national civilian levy of over five million men. For men whose war service is but a temporary interruption of civil life and occupation, the analogy of industrial compensation in known terms and legally claimable comes naturally to be applied to disability pensions and a constant struggle develops between this and the older service view of pensions as a discretionary grant.

In the first period the Government tried to keep the existing structure of administration. A cabinet committee, in the autumn of 1914, followed by a Select Committee under the chairmanship of the Rt. Hon. D. Lloyd George, considered the disability pension scales for both services and recommended substantially increased grants which were speedily embodied in War Office warrants and Admiralty regulations. The new scale which subsisted till the end of 1916, raised the widow's pension to 10s. a week (12s.6d. at 35 and 15s. at 45 years of age), and raised her children's allowances: it provided pensions for parents and other persons so far as they had actually been dependent on the deceased soldier or seaman: it increased the maximum disability pension to 25s. a week and gave the disabled man's child an allowance proportionate to his pension rate up to 2s.6d. a week. But the new warrants and regulations carried two important departures from former practice in regard to the very basis of disability pension. They recognized for pension the "aggravation" or worsening of a pre-enlistment injury or disease by service in addition to direct causation. This was an innovation called for by the mere fact that enlistments were being made of civilians of all ages up to 40 and in an emergency that did not admit of minute medical examination. More important in its consequences was the new principle of award by reference to capacity to earn a livelihood. The regulations laid down that the maximum pension was applicable to men "totally incapable of earning a livelihood," or if partially incapable the pension was to be such amount "as will, with the wages he may be deemed capable of earning, amount to 25s." While the principle itself found support in former service regulations, the actual wages earned had never been laid down as a criterion for determining the amount of the pension. The result was widespread grievance. The new principle as applied in practice undoubtedly acted as a deterrent to the exercise by the pensioner of such earning capacity as he had left and created a genuine grievance on the part of men who had returned to work.

The Government adopted also a further recommendation of the Select Committee by creating, under the War Pensions Act, 1915, a Statutory Committee of the Royal Patriotic Fund Corporation. The committee was given the functions, among others, of (a) supplementing warrant pensions in cases where, owing to exceptional circumstances, they appeared to be inadequate, and (b) providing for all matters involved in the resettlement in civil life of discharged disabled men (their health, training and employment) and of the widows, children and dependents of those killed. The committee was also required to cause local committees to be set up to act as local agent investigating cases and distributing its grants, and, if they were able to do so, to make grants of their own. The act gave neither the central nor the local committees any funds at all, in the view that they should raise voluntary funds of their own and that existing voluntary funds would be at once turned over to the new committees. Not unnaturally this expectation was quickly falsified and parliament had to vote a capital sum of one million for the purposes of the statutory committee. At once voluntary funds dried up and it speedily became apparent that public opinion expected the new organization, both central and local, to be financed entirely by public funds.

Pensioners were comparatively few in 1916, and the central committee was still mainly occupied with the work of supplementing the separation allowances of the families of the men still in service, when it was superseded (May 1917).

The Ministry of Pensions.—1916.—By the autumn of 1916 the grievances became serious. The Government met them by the Ministry of Pensions Act, 1916, which set up a new department with a responsible minister.

The new minister (the Rt. Hon. G. N. Barnes, M.P.) had to meet two primary sources of grievance—the chief was the practice, already mentioned, of determining the amount of the pension by reference to the man's earnings: the other, hardly less important, was the apparently arbitrary refusal of pension on the ground that a disability had no connection with service. The former grievance was taken up at once by a departmental committee, which included the minister and parliamentary secretary (Sir Leo Chiozza Money, succeeded after a short period by Sir Arthur Griffith Boscawen) and which undertook the task of revising the principles of assessment. They discarded altogether the criterion of the individual wages or earning capacity of the man, and substituted for it, as the only method of securing uniformity of compensation for like or similar disabilities, "the degree of disablement" sustained, on a judgment of "the man's physical capacity as compared with that of the ordinary healthy man of the same age" or, as the principle was more precisely defined by the later Select Committee on Pensions (1919), "the general disability in comparison with and by reference to industrial conditions as a whole and not in reference to the loss suffered by the individual disabled soldier." Further, to enable a more precise adjustment to be made of the extent or the "degree of disablement" sustained by the man, the former scale of assessment in quarters of disablement was discarded in favour of assessment by tenths, from 100% representing total disablement to 20%, compensation below the latter figure being awarded in the form of a gratuity or temporary allowance for a limited period. A schedule of fixed assessments for certain specific injuries was attached to the warrant both as a guarantee and an illustration

of the principles of assessment. At the same time to meet the case of the man whose civil earnings or profits of business had been so much above the average wage earner's that war disablement might represent a greater loss than would be fairly compensated by the ordinary rate of disability pension, the new ministry devised a new form of pension—the "alternative pension" by which on an estimate of the actual earning capacity left to the man the ordinary flat rate pension could be increased, within certain over-riding limits, so as to compensate more nearly the actual loss of earning power. The alternative pension was made available to widows also. New regulations were issued (March 1917) carrying out these principles, together with a slight increase in the scales of pensions, for all ranks and both services.

On the second of the ex-service men's grievances, the frequent and apparently arbitrary refusal of all title to compensation on the ground of want of any connection between the man's invalided disability and the conditions of his service, the Government were hard pressed in parliament. The difficulty was met by giving an appeal to a tribunal under a county court judge, to be appointed by the minister. There was also a new doctrine that the benefit of the doubt should be given to the claimant where a doubt existed as to connection between disability and service. Finally, cases ineligible for pension were granted gratuities of varying amounts up to £100.

Re-settlement.—By the spring of 1917 it had become patent that the re-settlement of disabled men in civil life would be a problem as important as pensions. With the breakdown of the Russian forces, and the prolongation of the war, the numbers of the disabled—by April 25, 1917, pensions had been granted to 160,000 disabled officers and men—would obviously increase beyond anything that had been contemplated in 1915 when the work of re-settlement was entrusted to the quasi-charitable statutory committee. Legislation (the War Pensions [Transfer of Powers] Act, 1917) was therefore promoted, transferring its powers to the ministry, while giving the power of supplementing pensions in cases of hardship to a new body, the Special Grants Committee, to be appointed by the minister.

The medical side of re-settlement was at the outset the most difficult. Accommodation for hospital treatment was scarce because the civil as well as the military hospitals were already being largely utilized by the army. In addition, the war was throwing up in large numbers cases for which but little or no provision had been made in peace times by voluntary effort. The Red Cross Society, which had already provided so amply for the needs of the serving soldier, readily responded to the minister's invitation to assist in the work of treating the discharged man and, with their help, additional accommodation was provided for cases of paralysis, epilepsy, neurasthenia and tuberculosis, and for the new orthopaedic treatment directed to the restoration of the function of nerve or muscle in surgical cases. Several special hospitals were also set up by other voluntary effort, and the civil hospitals agreed to take cases on terms.

The industrial re-settlement of disabled men, whose condition prevented their resuming their old occupations, was for the moment a simpler matter. Employment was abundant. The nucleus of an organization for the purpose was, however, created. The first condition of success was the co-operation of trades unions as well as of employers, so as to obtain union recognition for trainees in subsequent employment. For this purpose the ministry, with the help of the Ministry of Labour, formed a central committee (representing employers and unions) for each of the main groups of industry, and negotiated with the committee a scheme of intensive training to occupy usually not more than a year to 18 months. At the end of the course every trainee was judged by local representatives of the industry and, if he proved to have been satisfactorily trained, employment was found for him. Polytechnics and technical schools and universities, along with private employers, were invited and agreed to co-operate in this scheme.

The schemes of medical treatment and training were wisely linked up closely with the pensions, because the prevailing abundance of work at high pay was a strong temptation to disabled men to postpone necessary treatment, or provision for their industrial future. A special monetary inducement to men to accept any prescribed course of treatment or training was provided in the form of allowances (to take the place of current pension) at the maximum rate of disability pension, together with special allowances for wife and children, even if not ordinarily pensionable. At the same time men needing treatment could be penalized, if they refused it by reduction of current pension by as much as one half, while for trainees an additional inducement was provided by a bonus of 5s. for every week of training, together with a grant of tools, if the course of training was satisfactorily completed. The practical working of the local arrangements for both medical treatment and training, subject to the regulations and general control of the ministry, was delegated to the local war pensions committees.

The efforts of the new Ministry of Pensions were successful in carrying the administration over the remainder of the war. Medical treatment, with the stimulus of the special warrant allowances, was being given by the end of the year 1918 to some 60,000 men. Vocational training was being given to about 9,000 men. But the new organization had barely settled to its work when the Armistice was declared and demobilization began. At once a task confronted the ministry far beyond anything that its machinery was framed to deal with. Demobilization was hurried—by March as many as 50,000 men a day were passing through the dispersal stations—and as many as four million men were discharged from the army alone during 1919. Every officer and man was required to sign a form (Z.22) in which he had an opportunity of claiming (or of disclaiming) that he was suffering from a disability caused by service. Those who claimed disability were examined at once by service medical officers, and their reports referred to the Ministry of Pensions, which made awards of pension or other grant on the basis of these reports while the local war pension committees were empowered to deal provisionally with urgent cases. Later in the year came a further volume of claims from men who had been demobilized and who found, on returning to work, that they had ailments or injuries which they claimed to be due to their service. In the course of 1919, as many as 840,000 disability claims were made and 710,000 of them were admitted for compensation. Delay was inevitable in the settlement of this volume of cases, and the difficulties of mere machinery were complicated by other factors. The cost of living was rising to more than double (115% in 1919) the pre-war figure, and, although a bonus of 20% had been added to the pension rates in Nov. 1918, bringing the maximum pension for an ex-private to 33s. a week, the rates were regarded as inadequate, especially when contrasted with the high wage rates then current. The Government met the situation by the appointment in Jan. 1919, of a new minister of Pensions, Sir L. Worthington Evans, with a mandate to reorganize the administration, and a few weeks later by setting up another select committee to review the whole scheme of pensions.

The new minister at once strengthened and reorganized the staff of his department. He disencumbered it of the vocational training and re-employment of disabled men with which it had not the technical equipment to cope, and this branch of "re-settlement" was transferred to the Ministry of Labour, working in conjunction with the Boards of Agriculture and Education. At the same time he provided the ministry for the first time with an adequate medical staff both central and local, mainly by transfer from the recruiting organization of the Ministry of National Service. But he soon became convinced that the whole administration needed a more drastic change and decentralization of pensions administration, except for a central control of policy, was determined on. Eleven regions with central offices and staff, medical and lay, under regional directors were constituted, following the model of the war organization for recruitment. To each region was attached an outdoor medical staff appointed directly by the minister, for the examination of pensioners, and hospitals and clinics for their treatment, and a lay staff to supervise the work of the local committee staffs. For each region, moreover, was formed an advisory council, composed of representatives of the war pension committees of the district, which

met monthly for the discussion of difficulties that had emerged in local administration. The regional system of working carried the ministry very successfully through the great volume of work in connection with pension claims and medical treatment, which was at its maximum in 1919 and 1920. Thereafter the work declined and the last of the regional offices and advisory councils was abolished in 1926.

During 1918 three strong associations of ex-service men had been founded to formulate their grievances and war pensions committees were in many cases active in seconding their claims. The committee took a volume of evidence and sifted the whole working of pensions. Its recommendations, which were in the main accepted by the Government, were directed partly to giving greater precision to the rights of the pensioner or claimant and partly to increasing the scales of pension. In the former direction, the first step was the War Pensions Act, 1919, which substituted for the informal appeal tribunal appointed by the ministry in 1918, a new series of appeal tribunals, independent of the ministry, constituted by the Lord Chancellor and consisting of a legal chairman, a doctor and an ex-service officer or man, to hear and determine finally all appeals against a refusal by the ministry to admit disablement or death as due to, or aggravated by, war service. In the second place, a regular system of appeal to medical boards within the ministry was instituted for the benefit of pensioners who might claim to be dissatisfied with their pensions or to have become worse since they were last examined for pension. Moreover, pensioners and claimants were to be freely informed of their new rights of appeal. Finally, pensioners were by the act of 1919 given a statutory right "to receive such pension, gratuity or allowance as shall be awarded, but the award shall be subject to the conditions contained in the Warrant." These concessions gave a substantial semblance of civil compensation to war pensions.

With regard to the scales of pension the Government substantially increased the rates of all classes of pension by an amount which bore a definite relation to the percentage increase of the cost of living in 1919 over the cost in 1913–14. No new class of pensioner was created, except that the disability pension for non-commissioned ranks carried a new allowance for a wife (maximum 10s.0d. a week) married before the man's discharge. The increased rates of pension were by the terms of the warrant fixed for three years, but were then to vary annually according as the cost of living in the previous year had varied, by at least 5%, as compared with the cost in 1919. But though prices have fallen the rates have been maintained from time to time on the ground that stability of prices has not been reached. The Government have recently (July, 1928) announced that the rates will not be reduced however much the cost of living may fall, subject to certain conditions designed to safeguard both the pensioner and the State—namely (a) that the rates of pension shall still be deemed to be based on the cost of living in 1919, and therefore liable to increase if (though only if) the cost of living should ever come to exceed the cost in that year; and (b) that the maintenance of the present rates is conditional on the scope of the warrants and war pensions acts, so far as regards the classes of pensioner admissible, and their existing principles of working, remaining substantially unchanged. Stability of the pension list is thus secured along with the rates of pension.

Following the generous increase of World War rates, the claims of other classes of pension were forced upon the Government, and substantial increases given to long service pensions, to pre-war pensioners, both civil and service, and to other classes. Early in 1920, however, the Government deemed it advisable to review and define its pension obligations. The Ministry of Pensions Act 1916, passed in the hurry of war time, had made the minister of Pensions for all time the authority for awarding pension for service disablement, sustained either in peace or war. The Government decided that under normal conditions pension was more properly administered by the service departments who were responsible for the employment and pay of the man during his service. The result was the War Pensions Act, 1920, which confined the operations of the ministry to disabilities or deaths occurring as a result of

The rates of World War pension in force for navy, army and air force since 1919, and now (1929) stabilized, are as follows:—

	Non-commissioned ranks*		Officers (temporary)	
	From	To	From	To
1. Disability pensions.				
A. Flat-rate pension: for injury or disease attributable to or aggravated by service according to degree of disablement from 20% to 100%. Disablement of less than 20% is compensated by a gratuity or allowance.	8/-	40/- a week	£ 30	£ 210 a year
			Pension can be supplemented by a grant from Special Grants Committee, in cases of need where there is a family	
plus allowance for wife for children, up to 7/6 for first child and 6/- for each other child.	2/-	10/-		
B. Alternative pension, such addition to flat rate pension and allowances as will, together with remaining earning capacity, bring pension to	100/-		450	
2. Widow's pension.				
A. Flat rate pension:				
(i.) Husband's death within 7 years of discharge	20/- Under 40 and without children	26/8 Over 40 or with children	90 According to circumstances of husband's death	120
(ii.) Husband's death beyond 7 years of discharge, but only if husband a pensioner and died of his war disability.	One-half late husband's pension, or full rates above, according to degree of connection of death with service			
plus allowances for children	10/-, 7/6 and 6/- for first, second and subsequent children		36	
B. Alternative pension for death within 7 years, one half to two thirds (according to widow's age or family) of husband's pre-war earnings (increased by 60%) up to	66/8		300	
Dependant's pension	4/2	20/-		
Parent	According to need and incapacity for self support and expectation of support from deceased son		Not exceeding widow's pension, subject to need and infirmity	
Other dependant	20/- According to amount of pre-war dependance and need			

*The rates quoted in each column are those applicable to ex-privates or ex-seamen and to officers below the rank of major or lieut.-commander respectively. Higher rates are payable for higher ranks.

World War service which was defined as terminating on Aug. 31, 1921.

In 1921 another War Pensions Act completed the reform of administration by three important amendments of pension law:— (a) The persistent demand of pensioners that their pensions should be settled, and that they should be relieved of the frequent medical examinations which were necessary to establish their condition from time to time for pension purposes, was met. The act declared

every award, *i.e.* decision in respect of disablement claimed, made up to the date of the passing of the act (Aug. 21, 1921), if not stated to be subject to review, to be final; and in the case of all other pensioners, including those whose claims might hereafter be admitted, the ministry was directed to make regulations for determining finally the degree, if any, of disablement they were still to be regarded as suffering. A right of appeal was given within a year of the award to an independent appeal tribunal (appointed, like the other tribunals, by the Lord Chancellor, but composed of two medical men and an ex-service officer or man), but subject to this, the final award was unalterable. About 600,000 final awards—of which some 400,000 are life pensions—have been made since 1921.

(b) Claims for compensation on the score of disablement were only to be entertained by the ministry under its warrants if made within seven years of the man's discharge from service or before Aug. 31, 1921, which ever might be the earlier. (c) The right of appeal to one of the appeal tribunals, on a refusal of the ministry to admit a claim for disablement or death as due to war service, was declared to be exercisable within one year only of the notification of the ministry's decision. The same act also brought about a drastic alteration in the constitution and powers of the local committees. The existing committees were abolished and new areas of local administration created with officers directly responsible to the minister, and new committees, fewer in number, for them. The new committees, though composed much on the old lines, but with one quarter of their members disabled ex-servicemen, were given agency and advisory functions only, the chief of which were the investigation of complaints by pensioners, and the representation of them to the ministry, and the supervision of pensioned orphan children.

The subsequent history of World War pensions is one of gradual quiescence. The only important amendment of pension law in recent years has been the recognition (warrants of 1924) of claims to pension by widows and parents whose husbands or sons die more than seven years from discharge, but it is limited to widows or dependants of men who are recognized as being disabled at the time of death by the fact of the receipt of disability pension.

Awards of pension, allowance or gratuity have been made from the beginning of the war up to the end of March 1929, to over two million persons. Those in receipt of pension or other grant at that date numbered about a million, who, together with their wives and children so far as in receipt of allowances, may be grouped as follows: disabled officers, nurses and men, 507,000; widows of officers and men, 143,000; adult dependants of deceased officers and men, and 15,000 motherless children, 314,000; total pensioners 978,000; wives and/or children of the foregoing for whom allowances were payable, 536,000. The total expenditure on pensions of the World War from its outbreak to the end of March, 1929 (including that of the service departments before 1917) amounted to £860,000,000, a sum which will probably represent between one-third and two-fifths of the aggregate pension liability of the country by the time that the pension list is exhausted. The annual expenditure was at its maximum in 1920–21, when it reached £106,000,000. Since that date it has shown a continuous decline to 1929, when it was estimated at £53,750,000, and should continue to decrease, though at a slower rate. The liability in future years is calculated approximately at £51,000,000 in 1930–31, £37,000,000 in 1940–41, £26,000,000 in 1950–51, and £15,000,000 in 1960–61. (A. Ho.)

See PENSIONS, NAVY, ARMY, AIR FORCE; PENSIONS IN THE UNITED STATES.

WARQLA, a town of the Algerian Sahara. Pop. 3,251, the majority of mixed Berber and negro blood. The town is walled and is entered by six gateways, which are fortified. The French fort, barracks, hospital and other buildings are south of the native town. The oasis in which Warqla is situated contains two or three other small fortified *ksurs* or villages, the largest and most picturesque being Ruissat. The population of the oasis is about 12,000.

WARRANT, in English law, an authority in writing empowering a person to do an act or to execute an office. The term is applied to a great variety of documents of very different kinds.

Executive and Administrative.—While the royal prerogative was insufficiently defined and limited, a great many executive acts were authorized by royal warrant (*per speciale mandatum regis*) which now either depend on statute or are dealt with by departments of State without the need of recourse to the personal authority of the sovereign. There is hardly any exercise of the royal will which does not depend on the issue of a warrant attended with the strictest formalities designed to secure the responsibility of some minister for it, in illustration of the great constitutional principle that "the King cannot act alone." (*See* PREROGATIVE; PRIVY COUNCIL.) Under present constitutional practice royal warrants are as a general rule countersigned by a member of the cabinet or other responsible officer of State. By an act of 1435 (18 Hen. VI. c. 1) letters patent under the great seal must bear the date of the royal warrant delivered to the chancellor for their issue. This act still applies to all patents, except for inventions. The form and countersignature of warrants for affixing the great seal is regulated by the Great Seal Act 1884. Pardon, which was granted for centuries only by letters patent under the great seal, has since 1827 in England and 1828 in Ireland been granted in case of felony by warrant under the royal sign manual countersigned by a secretary of State (7 and 8 Geo. IV. c. 28, s. 13; 9 Geo. IV. c. 54, s. 33). The prerogative of the crown with reference to the control of the navy and army is largely exercised by the issue of warrants. In 1871 the purchase of commissions in the army was abolished by royal warrant. The convocation of naval courts-martial and the appointment of judge-advocate and provost-marshal at such court is by warrant of the Admiralty or of the officer on foreign or detached service who by his commission is entitled to convene such a court. (*See* Naval Discipline Act 1866, s. 58; Army Act 1881, s. 179.) A general court-martial for the army is constituted by royal warrant or convened by an officer authorized to convene such court, or his lawful delegate (Army Act 1881, s. 48). Appointments to certain offices under the crown are made by warrant of the king or of the appropriate department of State. In the navy and army the officers called warrant officers are so styled because they are appointed by warrant and do not hold commissions. Certain tradesmen to the court are described as "warrant holders," because of the mode of their appointment. Abuses of claims to this distinction are punishable (Merchandise Marks Act 1887, s. 20; Patents Act 1883, s. 107). The issue of warrants under the hand of a secretary of State, so far as they affect personal liberty, depends in every case on statute, *e.g.*, as to the surrender of fugitive criminals (EXTRADITION), or the deportation of undesirable aliens (*see* ALIEN), or the bringing of prisoners as witnesses in courts of justice. The right of a secretary of State by express warrant in writing to detain or open letters in the post office was recognized by orders in council and proclamations in the 17th century and by various acts, and is retained in the Post Office Act 1836 (s. 25).

Judicial and Quasi-Judicial Warrants.—Unless a statute otherwise provides a judicial warrant must be in writing under the seal, if any, of the court, or under the hand and (or) seal of the functionary who grants it. Committal for breach of privilege of the House of Commons is by warrant of the Speaker. During the Tudor and Stuart reigns frequent attempts were made by the crown and great officers of State to interfere with personal liberty, especially as to offences of State. The legality of these proceedings was challenged by the judges in Elizabeth's reign. On the abolition of the Star Chamber it was enacted (16 Car. I. c. 10) that if any person be imprisoned by warrant of the king in person, of the council board, or any of the privy council, he is entitled to a writ of *habeas corpus*, and the courts may examine into the legality of the cause of detention. This enactment, and the Habeas Corpus Act 1679, put an end to the interference of the executive with matters belonging to the judicature; but until 1763 there survived a practice by which a secretary of State issued warrants to arrest individuals for State offences, and to search or seize the books and papers of the accused. The latter practice was examined and declared illegal in the famous case of *Entick* v. *Carrington* (19 How. St. Tr. 1030) where it was held that a secretary of State is

the king's private secretary and has not, as such, the authority of a magistrate to issue a warrant. Still more important were the cases of *Leach* v. *Money* (19 St. Tr. 1001) and *Willus* v. *Wood* which declared the illegality of "general" or "uncertain" warranty, *i.e.*, warrants which do not testify the name of the person to be arrested. All privy councillors are included in the commission of the peace for every county. The council itself is said to have power to issue warrants of arrest for high treason, but the power, if it exists, is in abeyance in England. As a result of the gradual restriction of the royal prerogative, the term warrant has come in modern times oftenest to be used of documents issuing from courts of justice. Few documents issuing from the superior courts are called warrants. In these courts writs and orders are more generally used. In courts of record which try indictments a "bench warrant" is sometimes used for the arrest of an absent defendant, but the word warrant has for judicial purposes become most closely associated with the jurisdiction of justices of the peace. As a general rule no one can be arrested for a misdemeanour. But to this rule there are many statutory exceptions, as in the case of street offences, gambling, cruelty to animals, offences against the person, profanity and other misdemeanours, also of a breach of the peace actually committed in the presence of a constable. In the case of felonies, no warrant is necessary. At common law a justice of the peace, a sheriff, a coroner, a constable and even a private person, may arrest any one without warrant for a treason, felony or breach of the peace committed, or attempted to be committed, in his presence. A constable (whether a constable at common law or a police constable appointed under the Police Acts) may arrest a person indicted for felony; a constable or a private person may arrest on reasonable suspicion that he who is arrested has committed a felony. But in the latter case he does so at his peril, for he must prove (what the constable need not) that there has been an actual commission of the crime by some one, as well as a reasonable ground for suspecting the particular person. What is a reasonable ground it is of course impossible to define, but, in the case of a constable, a charge by a person not manifestly unworthy of credit is generally regarded as sufficient. An accused person who has been bailed may be arrested by his bail, and the police may assist in the arrest. In neither case is a warrant necessary. Nor is it necessary for the apprehension of one against whom the hue and cry is raised. The king cannot arrest in person or by verbal command, as no action would lie against him for wrongful arrest. In those cases in which arrest without warrant is illegal or is found inexpedient, information in writing or on oath is laid before a justice of the peace setting forth the nature of the offence charged and to some extent the nature of the evidence implicating the accused; and upon this information, if sufficient in the opinion of the justice applied to, he issues his warrant for the arrest of the person incriminated. The warrant, if issued by a competent court as to a matter over which it has jurisdiction, becomes a judicial authority to the person who executes it, and resistance to such a warrant is a criminal offence. The issue of a warrant by a justice of the peace is a judicial act, and provided he is acting within his jurisdiction, he cannot be sued for a "false imprisonment" by the person arrested, even though he has acted unreasonably in issuing it and the prisoner is acquitted. Speaking generally, a constable to whom a warrant is issued is protected from any action at law for executing it if it was apparently legal on the face of it, because he is bound to obey it. But if he arrested the wrong person or arrested without having the warrant in his possession, he is liable in an action for "false imprisonment." Entry upon the land or seizure of property cannot as a rule be justified except under judicial warrant. The only common law warrant of this kind is the search warrant, which may be granted for the purpose of searching for stolen goods. Special powers for issuing such warrants are given by the Army, Merchant Shipping, Customs, Pawnbrokers and Stamp Acts, and for the discovery of explosives or appliances for coining and forgery. The Official Secrets Acts of 1911 to 1920 are remarkable in that they disperse with the necessity of the intervention of a justice of the peace in the case of a search for official documents and enable the constable to make such a search on the order of a superintendent of police if it appears that "immediate action is necessary." The Criminal Law Amendment Act 1885 allows the issue of search warrants where it is suspected that a female is unlawfully detained for immoral purposes. Execution of the decisions of a court of summary jurisdiction is secured by warrants, part of the process of the court, such as warrants of distress or commitment. A warrant may also issue for the apprehension of a witness whose attendance cannot be otherwise assured. The forms of warrants used by justices in indictable cases are scheduled to the Indictable Offences Act 1848. Those used for summary jurisdiction are contained in the Summary Jurisdiction Rules of 1886.

As a general rule, warrants must be executed within the local jurisdiction of the officer who issued them. Warrants, etc., issued by a judge of the High Court run through England, in criminal as well as in civil cases: and the same rule applies as to courts having bankruptcy jurisdiction. The warrants of justices of the peace can be executed on fresh pursuit within 7 m. of the boundary of the jurisdiction, and if properly backed by a local justice or officer in any other part of the British Isles. (*See* SUMMARY JURISDICTION.) There is also a special provision as to executing warrants in the border counties of England and Scotland. Under the Extradition Acts and Fugitive Offenders Act 1881 provision is made for the issue of warrants in aid of foreign and colonial justice; but the foreign and colonial warrants have no force in the United Kingdom. The word is used as to a few judicial or quasi-judicial matters of civil concern, *e.g.*, warrant to arrest a ship in an admiralty action *in rem;* and in the county courts warrants to the bailiffs of the court are used where in the High Court a writ to the sheriff would be issued, *e.g.*, for attachment, execution, possession and delivery.

Financial and Commercial.—Payment out of the Treasury is generally made upon warrant. Treasury warrants are regulated by many of the acts dealing with the national debt.

Payment of dividends by trading corporations and companies is generally made by means of dividend warrants. Mercantile warrants are instruments giving a right to the delivery of goods, generally those deposited at a dock or warehouse, and by mercantile custom regarded as documents of title to goods.

Scotland.—By art. xxiv. of the Articles of Union royal warrants were to continue to be kept as before the union. The Secretary for Scotland Act 1885 enabled the crown by royal warrant to appoint the secretary to be vice-president of the Scotch Education Department. The lord advocate's warrant runs throughout the whole of Scotland. Warrants issued by courts of summary jurisdiction agree in the main with those in use in England, though their names are not the same. (*See* SUMMARY JURISDICTION.) There are many statutory provisions as to other warrants.

(W. F. C.)

UNITED STATES

Judicial warrants can be divided into the two classes of warrants of arrest and warrants of search and seizure. The use of general or John Doe warrants, which did not specify the name of the person to be arrested nor the place to be searched nor the character of the goods to be seized, and the use of writs of assistance having a like effect, a practice condemned in 1763 by Lord Camden in *Entick* v. *Carrington* (19 How. St. Tr. 1030) and one of the abuses complained of by the colonists in the Revolutionary War, led to the prohibition of the issuance of such warrants by constitutional provisions. The 4th amendment to the U.S. Constitution thus provides against unreasonable searches and seizures and prohibits the issuance of any warrant "but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the person or things to be seized." Though this amendment is only a limitation upon the powers of the Federal Government, similar restrictions upon the States are to be found in the State Constitutions.

Warrants of arrest, which are necessary where under the common law or under statutory provision no power to arrest without warrant may be exercised, may be issued by those officers designated by the State or Federal statutes. These ordinarily include judges, U.S. commissioners, justices of the peace and judicial or quasi-judicial officers of municipal corporations. A similar power

is conferred upon certain administrative officers in the exercise of their functions, the commonest example being that of warrants issued by the Department of Labor in the deportation of aliens. Under the traditional laws of parliamentary privilege a power to issue warrants of arrest for breach of privilege resides in the speaker of a legislative assembly or the president of a senate. The warrant issues at the behest of the complainant upon a complaint setting forth the facts or information upon which the guilt of the offender is based. Probable cause must be shown in the sense that the complainant must make out a *prima facie* case for concluding that the person accused was guilty of the crime. The complaint must be accompanied by the affidavit of the complainant. The forms and requisites governing the issuance of the warrant must be strictly complied with. The legality of the warrant and the arrest thereunder can be contested by a *habeas corpus* proceeding (*q.v.*) or by an action for false imprisonment. Analogous to the ordinary warrant of arrest is the bench warrant which is issued by the court itself for arrest for contempt or after indictment found or against a recalcitrant witness.

The issuance of search warrants is governed generally by the same limitations surrounding warrants of arrest. The description of the property to be seized must be so particular that the officer charged with the execution of the warrant will be left with no discretion respecting the property to be taken. It may issue for the recovery of stolen property, for the seizure of property used for the commission of a crime or in the possession of a person intending to use it for such a purpose. The warrant should be executed only during the day-time but the officers when resisted may forcibly enter the premises. In its execution its limitations must be strictly observed, and the search confined to the character of goods enumerated in the warrant. Resistance to its execution is punishable. The legality of its issuance is in some instances reviewable by writ of certiorari to a superior tribunal. In all cases the legality of its issuance and execution can be contested by an action of trespass against the officer. In order to make more effective the constitutional prohibition against unreasonable searches and seizures the Federal courts refuse to admit any evidence obtained as a result of a search without a warrant or under an illegal warrant. The majority of the State courts, however, admit such evidence and leave the complainant to his civil action against the offending officer. The enforcement of the constitutional protection against unreasonable searches and seizures has become a matter of intense moment in the prosecution of offenses against the 18th amendment and legislation under it seeking to make effective the constitutional prohibition against the sale, manufacture and transportation of intoxicating liquor. The assertion of these new and penetrating powers of government has, in communities where their assertion is regarded as an infringement upon the liberty of the citizens, precipitated issues akin to those that agitated the citizenry during the controversy over general warrants and writs of assistance.

Other judicial warrants may be briefly adverted to. The escape warrant is issued for the recapture of prisoners who have escaped from custody. The warrant of commitment is the process by which a court directs a ministerial officer to take a person to prison either before or after trial. Orders directing the execution of an offender are known as death warrants, commonly issued by the governor of the State. In some States their issuance is by statute a prerequisite to the execution of the death sentence; in others the pronouncement of the sentence in open court is sufficient authority for its execution. The landlord's warrant is directed by a landlord to a constable to levy upon the goods of his tenant and sell them in order to constrain the latter to pay the rent. Under the Federal Bankruptcy Act of 1898, Section 69, a judge may issue a warrant to a marshal authorizing him to seize the property of a bankrupt upon proof that the latter is neglecting his property or allowing it to deteriorate. A tax warrant is the authority under which a collector is authorized to collect taxes.

Numerous other warrants of a financial or commercial nature are also known to the American law. The term warrant is used to apply to an order or draft for the payment of an indebtedness. School warrants thus issue for the payment of an indebtedness incurred by a school board or district. Like a check or draft it is a conditional payment of the debt. Similarly there are municipal warrants, treasury warrants, State warrants, reclamation warrants, dividend or interest warrants of private corporations. Land warrants are transferable certificates issued by the Government entitling the holder to a specific tract of public land. A warrant of attorney is a writing addressed to one or more attorneys authorizing them to appear in court in behalf of the person who gives the warrant and confess judgment in favour of some particular person named in the warrant. They are commonly used to facilitate the collection of negotiable instruments and such a provision authorizing the confession of judgment on the note is commonly appended to the negotiable instrument. Some States by statute prohibit judgments by such confession. (J. M. La.)

WARRANT OF ATTORNEY. A warrant of attorney to confess judgment is a security for money (now practically obsolete) in the form of an authority to a solicitor named by a creditor, empowering him to sign judgment in an action against the debtor for the sum due, with a clause that the warrant shall not be put into force in case of due payment.

WARRANTY, etymologically, another form of GUARANTEE (*q.v.*). It is used, however, in a rather different sense. The sense common to both words is that of the collateral contract. A "warranty" expresses the collateral responsibility of the principal actor, while "guarantee" expresses that of his surety. It differs from a condition in that a condition forms the basis of the contract and a breach of it discharges from the contract, and from a representation in that the latter does not affect the contract unless made a part of it expressly, or by implication as in contracts of insurance and other contracts *uberrimae fidei,* or unless it be fraudulent. These distinctions are not always maintained. Thus in the Real Property Act 1845, s. 4, condition seems to be used for warranty.

Warranty as it affected the law of real property was, before the passing of the Real Property Limitation Act 1833 and the Fines and Recoveries Act 1833, a matter of the highest importance. A warranty in a conveyance was a covenant real annexed to an estate of freehold, and either expressed in a clause of warranty or implied in cases where a feudal relation might exist between feoffor and feoffee. The warranty, as described by Littleton, s. 364b, 697, was an outgrowth of feudalism, and something very like it is to be found in the *Liber Feudorum.* At the time of Glanvill the heir was bound to warrant the reasonable donations of his ancestor. Warranty was one of the elements in Bracton's definition of homage, 78*b*, "juris vinculum quo quis astringitur ad warrantizandum defendendum et acquietandum tenentem suum in seisina versus omnes." For an express warranty the word *warrantizo* or warrant was necessary. The word "give" implied a warranty, as did an exchange and certain kinds of partition. In order to bind heirs a clause of warranty was required. This was either lineal, collateral or commencing by disseisin. The feoffor or his heirs were bound by voucher to warranty or judgment in a writ of *warrantia chartae* to yield other lands to the feoffee in case of the eviction of the latter. Vouching to warranty was a part of the old fictitious proceedings in a common recovery in use for the purpose of barring an entail before the Fines and Recoveries Act. Warranty is now superseded by covenants for title. The more usual of these are now by the Conveyancing Act 1881 deemed to be implied in conveyances. For the implied warranties of title and quality *see* SALE OF GOODS. Vouching to warranty was at one time important in the law of personalty as well as of realty. Warranty, as it exists at present in the law of personalty, is either express or implied. The principal cases of implied warranty occur in the contracts of sale and insurance. There is also an implied warranty in other kinds of contract, *e.g.,* of seaworthiness by the shipowner in a contract between him and a charterer for the hire of a ship. In all cases of implied warranty the warranty may be excluded by the special terms of the contract. For breach of warranty an action may be brought directly, or the breach may be used as ground for a counter claim or for reduction of damages, but the breach will not in the case of a warranty proper entitle the person suffering by it to a rescission of the contract. Thus in a sale the property passes although the warranty be broken. In some cases warranties

on sale are the subject of statutory enactments, as the Merchandise Marks Acts and the Sale of Food and Drugs Acts.

Scotland.—Warranty is a term imported into Scots law in connection with mercantile law. Differing from the English interpretation it signifies a material condition of the contract, breach of which discharges from the contract in the option of the other party (*see* Sale of Goods Act 1893, ss. 53 [5] and 62 [1]). The term native to Scots law is "warrandice." It occurs in connection with deeds transferring land or discharging obligations, and is in the form of a warranty by the grantor that his title is good. Warrandice is either real or personal. Real warrandice is that whereby warrandice lands are made over, as indemnity for those conveyed, to assure the person to whom they were conveyed from loss by the appearance of a superior title. Real warrandice is implied in excambion or exchange of lands. Its effect is that the excamber, in case of eviction, may recover possession of his original lands. Personal warrandice is either express or implied. There is an implied warrandice in every onerous deed. Express warrandice may be either simple, against the future acts of the grantor; from fact and deed, against the grantor's own acts whether past or future; or absolute, *i.e.*, against acts and deeds whether (a) of the grantor or (b) of a third prior to the date of the deed. A clause of warrandice is the Scottish equivalent of the English covenants for title. By the Titles to Land Consolidation (Scotland) Amendment Act 1869 a clause of warrandice in the form given in the schedule to the act imports absolute warrandice as regards the lands and the title-deeds thereof, and warrandice from fact and deed as regards the rents.

United States.—In the United States the common law warranty accompanying the conveyances of real property seems never to have been known. Personal covenants of title were developed in its place and with greater vigour than in England inasmuch as purchasers were unaccustomed to examine titles with the particularity that is common in England. These covenants of title generally embrace the covenant of seisin or right to convey, the covenant against incumbrances, the covenant for quiet enjoyment and of warranty. This modern covenant of warranty, which is not recognized in England, is quite different from the common law covenant of warranty. Under this covenant the grantor warrants that he will defend the grantee against all lawful claims by third persons. In some States by statute these covenants are implied from the simple terms granting the estate; in other States by statute no such covenants are implied but must be express. The quit-claim conveyance ordinarily imports no covenants but as altered by statute in some States it carries with it a covenant of title. In sales of personal property, warranties are governed by sections 12–16 of the Uniform Sales Act. Any affirmation of fact or promise by the seller relating to the goods and inducing the buyer to purchase them is regarded as an express warranty. In the absence of express warranties the buyer is protected by the implication of warranties of title and quality. In contradistinction to the English law of sale, rescission for breach of warranty is permitted. The buyer may tender back the goods and recover the purchase price. (*See* Sale of Goods.) Sections 65 and 66 of the Uniform Negotiable Instruments Law govern the character of warranties that accompany the transfer of negotiable instruments with or without indorsement. Warranty in insurance law operates to relieve the insurer of liability for breach thereof. Legislation commonly provides that no statements of fact made by the insured shall be regarded as warranties relieving the insurer of liability unless made with the intention to deceive or material to the risk.

WAR RELIEF WORK. Upon the outbreak of the World War in 1914 relief problems far surpassed the capabilities of private charity, involving broad questions of governmental finance, control of production, purchase and transport of huge quantities of supplies from one part of the world to another, intervention of diplomatic agencies, control of shipping and railways, and finally, after the war, general economic rehabilitation and broadly conceived treatment of fundamental social ills. For the first time in history, virtual world control of production and distribution of food was attained (*see* Red Cross).

CIVILIAN RELIEF IN BELGIUM AND FRANCE

During the occupation of Belgium, inhabitants found themselves in desperate straits from interruption of agriculture and the confiscation of stocks by the occupying forces. Belgium's essential food imports were cut off, and hordes of refugees fled before the advancing German armies. Herbert Hoover, an American engineer, with the backing of the U.S. Government persuaded the Allied Govts. to open the blockade and to secure guarantees from Germany against interference and requisitioning of local food products. The Commission for Relief in Belgium (C.R.B.) established by Herbert Hoover as a neutral organization in the midst of war, possessed recognized diplomatic rights and obligations, flew its own flag and issued its own passports.

Food had to be supplied to the 9,000,000 inhabitants of Belgium and northern France. It had to be secured in disorganized markets; supplies had to pass across mine-strewn waters through the naval blockade, and be towed through 133m. of obstructed waterways, passing across the German military line. Relief vessels, 2,313 in number, carried in the neighbourhood of 100,000 tons each month for nearly five years.

The commission formed a committee of Germans, Belgians and Americans which took over harvests of breadstuffs, insuring equitable distribution to the civil population. The world's charity was mobilized through nearly 2,000 committees. Within Belgium and northern France were set up nearly 10,000 communal committees. Purchasing and shipping agencies were organized in the principal world markets and ports. Offices for governmental *liaison* were maintained at Brussels, London, Paris and Washington. Upon America's entry into the war the C.R.B. remained unchanged, except for the necessary withdrawal of American directors from within the German lines. The Spanish-Dutch committee for the protection of the relief in Belgium and northern France took over diplomatic and other functions within the lines. The national committees, one Belgian and one French, administered distribution. These were the Belgian Comité National de Secours et d'Alimentation and the Comité d'Alimentation du Nord de la France under the leadership of Emile Francqui.

During the whole period the commission acquired goods well over $1,300,000,000 in value, including interchange of native products. More than 55,000 volunteers gave their services. Over 5,000,000 tons of supplies were imported. The Belgian Government granted monthly fixed subsidies to the commission from loans advanced by the United States, Great Britain and France. The actual financial resources of the commission amounted to $894,797,150, the expenditure of the benevolent side of the relief organization was $615,237,147 of this total. Of the total funds available to the commission, 47% came from the United States ($421,153,287); 23% from French Treasury loans ($204,862,854); 14% from British empire sources ($125,686,364); and 16% from other sources. The total administrative expenditure of the C.R.B. was kept down to less than one-half of one per cent. The average prices maintained for staple foods in the occupied territory during the entire period of the war were from 15 to 20% less than prices in the Allied countries at the same periods. The Belgian and French Governments in May 1919 took the responsibility of feeding their people.

RELIEF IN CENTRAL EUROPE

When peace came in November 1918 the Allied and associated Governments were confronted with the necessity of extending relief not only to liberated territories in central Europe but also to their enemies. From the Baltic to the Adriatic and Black seas hundreds of millions of people desperately needed food until agricultural production could be brought back and until industries and transportation could be restarted. Herbert Hoover was appointed director-general of Allied Relief, under the Supreme Economic Council. Because America was in a better food position than any of the nations of Europe, the United States was destined to play the principal part, supplemented by a substantial programme of Great Britain. Hoover formed the American Relief Administration (A.R.A.) to carry out the work. The U.S. Grain Corporation handled finances, purchasing and shipping. To

assure the success of the complicated arrangements for the mass feeding of millions of people the director general took temporary control of railways in central and southern Europe, re-established or controlled 10,000m. of telegraph and telephone lines, arranged barge shipments on rivers, initiated food exchanges between States, re-allocated army supplies suitable for civilian needs, established a temporary monetary exchange system, furthered import of raw material, controlled coal production and generally helped struggling Governments to re-establish economic life.

Food from America had to be transported overseas and distributed in 21 countries or States. American deliveries to Allied or neutral countries were financed on credit by the U.S. Treasury. With the exception of Austria, deliveries to ex-enemy countries were paid for in cash. Deliveries to the new States were either as outright gifts or long-term loans. The U.S. Congress also appropriated $100,000,000 as a revolving fund for the operations. Allied and neutral countries supplied by the United States were Italy, Denmark and Holland; ex-enemy countries supplied against cash payments were Germany, Austria, Hungary, Bulgaria and Turkey. The so-called liberated territories supplied were Finland, Estonia, north-west Russia, Latvia, Lithuania, Poland, Belgium, northern France, Czechoslovakia, Rumania, Yugoslavia, south Russia and Armenia.

Notwithstanding its difficult financial position, the British Government was able to appropriate £12,500,000 and to set up other substantial grants. Great Britain agreed to fill the gaps between what the United States could provide and what was required for barest necessities. British assistance was given to Poland, Serbia, Czechoslovakia, Rumania, Estonia and Austria, relief being administered by Sir William Goode.

During the Armistice year relief deliveries to Europe reached about 4,760,000 tons of food valued at over $1,147,600,000. More than two-thirds or $870,000,000 worth, came from the United States. About $120,000,000, or 10%, came from the United Kingdom; from France and Italy about 2% each; about 4% was financed jointly by the United States, France and Italy; and about 5% came from other countries. Inland transportation was paid for by the Governments aided. Local ministries and volunteer committees attended to distribution.

These prompt relief measures undoubtedly saved Europe from great social cataclysm. The relief operation laid down "a wall of food" against militant Russian world revolution.

Privately Organized Relief.—With the signing of peace, all these Allied and American organizations passed out of existence. Certain stocks given by the American Government for charitable purposes were turned over to a new private organization formed by Herbert Hoover, also known as the American Relief Administration. Large numbers were still faced by extreme shortage. Children were the greatest sufferers. The new privately organized A.R.A. carried on mass child feeding in Finland, Estonia, Latvia, Lithuania, Danzig, Poland, northern France, Czechoslovakia, Austria, Hungary, Rumania, Yugoslavia and Armenia. American Quakers co-operated with the A.R.A. in feeding over 1,000,000 children in Germany. The work was carried on until 1923.

During that period about 8,000,000 different children benefited from this charitable relief. Cooked meals were distributed to as many as 4,000,000 children daily at one time, to whom a total of over 1,500 million meals were served. Clothing to the value of over $8,000,000 was distributed to more than 2,000,000 children. These governments also donated some foods and financed some of the foreign imports. National welfare bodies founded and built up by the A.R.A. were perpetuated in many countries. The total amount expended for these post-war charitable operations reached nearly $100,000,000.

Dr. Fridtj of Nansen prevailed upon the League of Nations to help in repatriation of prisoners of war, bringing more than 427,000 war prisoners out of Russia and Siberia back to their homes in a dozen countries. Prominent in post-war relief works were the Save the Children funds of Great Britain and many other countries which, through Dr. Nansen, brought help to eastern European countries; the American Jewish Joint Distribution Committee in Poland, Czechoslovakia, Austria and other places; several Irish relief committees; the American and British Societies of Friends (Quakers). The French war orphans committee brought aid to children in devastated France. The Rockefeller Foundation gave over $22,500,000 for the relief work of the Commission for Relief in Belgium and other charitable purposes.

Russian Famine.—When these post-war relief operations were closing down, famine in Russia faced 25,000,000 people in the Volga valley with starvation. Herbert Hoover revived the A.R.A., secured grants from the U.S. Government, induced the Soviet Russian Government to purchase seed grains, and rushed food, grain and medical supplies. Dilapidated ports, broken-down railways, the general inertia of the broken *morale* of the Russian people, and the dissolution of the productive organism, complicated by suspicions of the Soviet Government against emissaries from "capitalist" America made the task of bringing immediate effective relief to the people in an area of 770,000 sq.m. immense. Every step of operations of transport and distribution had to be supervised amid greatest economic disruption and appalling scenes of misery.

This was accomplished by less than 200 persons supervising a distributing organization of nearly 150,000 Russian workers. More than 10,000,000 people were fed; medical and sanitary supplies valued at $7,600,000 were distributed to 16,500 hospitals and other institutions to combat the spread of typhus, cholera, and other epidemics following in the wake of famine; over 8,000,000 vaccinations or inoculations against smallpox, typhoid and para-typhoid were given to people in epidemic regions; 200,000 tons of seed grain were distributed; and other relief measures brought the total value of American relief to the Russian famine to about $60,000,000. The work was made possible by the contribution of $24,000,000 in cash and medical supplies by the U.S. Government, of $3,600,000 worth of medical supplies by the American Red Cross, about $4,000,000 by the American joint distribution committee, and of $12,000,000 worth of seed grain purchased and transported by the A.R.A. against gold payment by the Soviet Government. Many other American groups co-operated in furnishing means to an extent of nearly $3,000,000. These were the Society of Friends, Mennonite relief, European student relief, Federal Council of Churches of Christ in America, Knights of Columbus, National Catholic welfare council, National Lutheran Council, Volga relief society, Y.M.C.A. and Y.W.C.A. The Russian operations of the American Relief Administration started in September 1921, and were brought to a close in July 1923. Although the sums thrown into Russian famine relief by British agencies and the Nansen relief committee were small in comparison with the American relief, the accomplishment was effective. As High Commissioner for the League of Nations, Dr. Nansen also co-operated with the A.R.A. in care of Russian refugees in the Balkans, arranging for the transport of some 15,000 of these refugees to other localities where they could be supported. (*See* REFUGEES; FAMINE; ROCKEFELLER BENEFACTIONS.)

Gay, *The Commission for Relief in Belgium,* Stanford University, Cal.; Sir William Goode, *Economic Conditions in Central Europe* (Cmd. 641, 1920). (G. B. B.)

WARREN, SIR CHARLES (1840–1927), English soldier and archaeologist, was born at Bangor, Wales, on Feb. 7, 1840. In 1857 he entered the Royal Engineers. From 1861 to 1865 he was engaged in a survey of Gibraltar, but then went to Palestine where he became interested in archaeology. He conducted excavations at Jerusalem until 1870, and made for the Palestine Exploration Fund the first systematic archaeological survey of the Holy Land. He published *The Recovery of Jerusalem* (1871), and, with C. R. Conder, *The Survey of Western Palestine* (1884). In 1876 he was appointed commissioner to determine the boundary line between Orange Free State and Griqualand West. In 1876, on the outbreak of the Kaffir War, he was given command of the Diamond Fields Horse. He quelled an uprising in Bechuanaland, and in 1879, as administrator of Griqualand West he organized a

force to defend the Transvaal. In 1884 he explored in Arabia Petraea, but before the year was over was again sent to South Africa to restore order in Bechuanaland. He proclaimed the territory south of the Malopo river a crown colony under the name of British Bechuanaland. He served in the Boer War as lieutenant-general in command of the Fifth Division but after the British disaster at the Tugela river was transferred to an administrative post. He died at Weston-supermare, England on Jan. 21, 1927. Among the more notable of his later books was *On the Veldt in the Seventies* (1902).

WARREN, GOUVERNEUR KEMBLE (1830–1882), American soldier, was born at Coldspring (N.Y.), on Jan. 8, 1830, and was graduated from West Point in 1850. He was assigned to the engineers, and was employed in survey work in the West, where he took part in some expeditions against the Indians. In 1859 he was made assistant instructor in mathematics at West Point. At the outbreak of the Civil War he was made lieutenant colonel of volunteers and posted to the newly raised 5th New York volunteer infantry. In August he was promoted to the rank of colonel. He commanded a brigade of the volunteer corps at Gaines's Mill, Second Bull Run and Antietam, and was promoted to the rank of brigadier general of volunteers. During the Fredericksburg campaign he was on the engineer staff of the Army of the Potomac, but after Chancellorsville he was appointed chief of engineers, and in that capacity rendered brilliant services at Gettysburg (*q.v.*), his reward being promotion to major general U.S. volunteers and the brevet of colonel in the Regular Army. When the Army of the Potomac was reorganized in the spring of 1864, Warren returned to the volunteer corps as its commander.

His services in the Wilderness (*q.v.*) and Petersburg (*q.v.*) campaigns proved his fitness for this command, but his lively imagination and the engineer's habit of caution made him a brilliant but somewhat unsafe subordinate. At the critical moment preceding the battle of Five Forks, Sheridan, in charge of the operations, was authorized by Grant to relieve Warren of his command if he thought fit. At first the volunteer corps fell into confusion, which Warren exerted himself to remedy, and the battle was an important Union victory. But after it had ended Sheridan sent for Warren and relieved him of his command. A court of inquiry entirely exonerated Warren from the charges of apathy which Sheridan brought against him. General Warren died Aug. 8, 1882, at Newport (R.I.).

WARREN, JOSEPH (1741–1775), American soldier and patriot, born at Roxbury (Mass.), June 11, 1741. He graduated at Harvard College in 1759, studied medicine at Boston, and soon acquired a high reputation in his profession. The passage of the Stamp Act aroused his patriotic sympathies and brought him in close connection with Samuel Adams, John Adams, and Josiah Quincy, Jr., as a leader of the popular party. He drafted the "Suffolk Resolves," which urged forcible opposition to Great Britain, if such should be necessary, pledged submission to such measures as the Continental Congress might recommend, and favoured the calling of a provincial congress. These "resolves" were unanimously adopted by a convention at Milton (*q.v.*) on Sept. 9, 1774. Warren was a member of the first three provincial congresses (1774–75), president of the third, and an active member of the committee of public safety. On June 14, 1775, he was commissioned a major general, but three days later, and before his commission was made out, he took part as a volunteer, under the orders of Putnam and Prescott, in the battle of Bunker Hill (Breed's Hill), where he was killed.

WARREN, SAMUEL (1807–1877), English lawyer and author, son of Dr. Samuel Warren, rector of All Souls', Ancoats, Manchester, was born near Wrexham in Denbighshire on May 23, 1807. The elder Samuel Warren (1781–1862) was the founder of the "Warrenites," seceders from Wesleyan Methodism, who formed the United Methodist Free Churches.

His son, the younger Samuel Warren, studied medicine but abandoned this and entered the Inner Temple in 1828, took silk in 1851, was made recorder of Hull in 1852, represented Midhurst in parliament for three years (1856–1859) and was rewarded in 1859 with a mastership in lunacy. He was the author of two extraordinarily successful books: *Passages from the Diary of a Late Physician* (1838), and *Ten Thousand a Year* (1881). Warren died on July 29, 1877. He had collected his *Works: Critical and Imaginative* (4 vols., 1854).

WARREN, WHITNEY (1864–), American architect, was born in New York city, on Jan. 29, 1864. After studying at the École des Beaux Arts, Paris, under Daumet and Girault (1885–94), he began the practice of architecture in New York, later becoming associated with Charles D. Wetmore in the firm of Warren and Wetmore. They specialized in railway architecture, hotels, business buildings and residences and were architects for the New York Central, Michigan Central, Canadian Northern and Erie railways. Their numerous structures in New York city include the Chelsea docks, the Grand Central terminal and the hotels Belmont (1905), Vanderbilt (1910), Biltmore (1912) and Commodore (1916). In 1920 he was chosen by the international committee to reconstruct the library of the University of Louvain, destroyed by the Germans in 1914.

WARREN, a city of Ohio, U.S.A., on the Mahoning river. Pop. (1920) 27,050 (80% native white); 1928 local estimate nearly 44,000. The city occupies 8·6 square miles and was named after Moses Warren, a surveyor of the Connecticut Land Company. It was settled in 1799. In 1834 the village was incorporated, and in 1839 it became a port on the new canal from the Ohio river, at the mouth of the Beaver, to Lake Erie. In 1869 it was incorporated as a city.

WARREN, a borough of north-western Pennsylvania, U.S.A., the county seat of Warren county; on the north bank of the Allegheny river. Pop. (1920) 14,272 (85% native white); 1928 local estimate 16,000. Warren lies 1,246 ft. above sea-level, at the southern foot of a high, sheer ridge, in a beautiful and fertile region, rich in oil and gas. Hydro-electric power from Niagara Falls and the Clarion river is available, in addition to natural gas from the local field. In the suburbs is a State hospital for the insane (1873) with grounds covering 1,288 acres. Warren was laid out in 1795 by direction of Governor Mifflin, and was named for Gen. Joseph Warren, the Revolutionary war officer. The borough was incorporated in 1832.

WARREN, a town of Bristol county, Rhode Island, U.S.A., on the east shore of Narragansett bay, at the mouth of the Warren river, 10 m. S.E. of Providence. Pop. (1920) 7,841.

WARREN, properly an old term of the English forest law, applied to one of the three lesser franchises, together with "chase" and "park," included under the highest franchise, the "forest," and ranking last in order of importance. The "beasts of warren" were the hare, the coney (*i.e.*, rabbit), the pheasant and the partridge. The word thus became used of a piece of ground preserved for these beasts of warren. It is now applied loosely to any piece of ground, whether preserved or not, where rabbits breed. (*See* FOREST LAWS.)

WARRINGTON, HENRY BOOTH, 1ST EARL (1652–1694). *See* DELAMERE, GEORGE BOOTH, 1ST BARON.

WARRINGTON, market town of Lancashire, England, at the crossing of the river Mersey. Pop. (1921) 76,811.

Warrington is supposed to be of British or earlier origin, and the Roman road from Chester to the north passed through it. In Henry I.'s reign Warrington was the head of a barony created for Pain de Vilars, but both manor and barony passed to the Botelers or Butlers, who first established their residence on the mote hill and before 1280 built Bewsey in Burton wood. The Butlers held both barony and manor till 1586, when the barony lapsed and the manor passed to the Irelands of Bewsey, then to the Booths and in 1769 to the Blackburns. In 1277 Edward I. granted a charter for a weekly market on Friday, and an annual fair of eight days from the eve of St. Andrew (Nov. 30), and in 1285 another charter confirmed a change of market day from Friday to Wednesday and extended the summer fair to eight days. The fairs are still held, as well as the Wednesday chartered market, besides a Saturday market which is probably customary. In the 18th and early 19th centuries the chief industries were huckabacks and coarse cloths, canvas, fustians, pins, glass, sugar-refining and copper. During the Civil War the inhabitants were

royalists and the earl of Derby made the town for some time his headquarters in order to secure the passage of the Mersey. In April 1643 the parliamentary forces attacked it, but had to raise the siege. Lord Derby left Colonel Edward Norris in command and in May the parliamentarians again attacked the town, which was forced to surrender. In 1648, part of the royal forces under General Baillie rallied temporarily at Warrington. During the Rebellion of 1745, on the approach of Prince Charles Edward from Manchester, the bridge was cut down. A borough was created by William le Boteler about 1230 by a charter (not preserved); but its growing strength alarmed the lord who contrived to repress it before 1300, and for over 500 years Warrington was governed by the lord's manor court. There was a friary of Augustine or Hermit Friars here founded apparently about 1280.

The fine church of St. Elphin (Decorated style), has a lofty central tower and spire. The crypt of a much earlier church remains beneath the chancel. The town hall, a classical building (18th century) formerly a residence, was purchased by the corporation in 1872, the park being opened to the public. The other chief buildings are the museum and free library, technical institute and market hall. The educational institutions include a grammar school (1526), and a blue-coat school (1665). A few half-timbered houses of the 17th century remain. The Warrington district is an important centre of the tanning industry. There are also iron bar, hoop and wire works, tool, soap, glass and chemical works, foundries and cotton mills. The Manchester Ship Canal is here crossed by five bridges. The town was incorporated in 1847. Area, 3,057 acres.

WARRISTON, ARCHIBALD JOHNSTON, LORD (1611–1663), Scottish judge and statesman, son of James Johnston, was baptized on March 28, 1611, educated at Glasgow, and passed advocate at the Scottish bar in 1633. In 1637 he drew up the remonstrances of the Covenanting leaders against Charles I.'s attempt to force the English liturgy upon Scotland, and with Alexander Henderson, was a principal author of the National Covenant of 1638. In June 1639 he took part in the negotiations leading to the Treaty of Berwick, when his firm attitude displeased the king. He was appointed in 1640 to attend the general of the army and the committee and on June 23 wrote to Lord Savile asking for definite support and the acceptance of the National Covenant by the leading opposition peers in England. In October he was a commissioner for negotiating the Treaty of Ripon. In 1641 he led the opposition on the point of control of State appointments during the king's visit to Scotland.

In accordance with the king's short-lived policy of conciliation Johnston was appointed a lord of session Nov. 13, 1641, with the title of Lord Warriston, and was knighted and given a pension. In the same month the parliament appointed him a commissioner at Westminster for settling the affairs of Scotland, and he was later (1643) made a member of the committee of both kingdoms, which directed the military operations. Early in 1644 he took his seat in the Assembly of Divines, where he was strongly opposed to independency and to lay control in ecclesiastical affairs. He was also member for Edinburgh in the Scottish parliament (1643–47) and speaker of the barons.

In Oct. 1646, Johnston was made king's advocate after Charles had surrendered himself to the Scots. In 1648 he became the leader of the "remonstrants," the party opposed to the "engagement" concluded by the predominant party with Charles at Carisbrooke. (*See* ENGLAND: *History.*) In October, after the defeat of the "engagers" at Preston he met Cromwell at Edinburgh, and helped to promote the Act of Classes (Jan. 23, 1649), disqualifying royalists; but after the king's execution good relations with Cromwell were broken off, and Johnston was officially present at the proclamation of Charles II. as king in 1649 at Edinburgh. On March 10, he was appointed lord clerk register; in May he pronounced sentence on Montrose. After the defeat of Dunbar (Sept. 3, 1650) at which Johnston was present, he urged the removal of David Leslie from the command, and on Sept. 21, delivered a violent speech in Charles's presence, attributing all the troubles to the opposition of the Stuarts to the Reformation.

Johnston now committed himself to the faction of the remonstrants, who desired to exclude the king, and whom he represented in London in 1656. On July 9, 1657, he was restored by Cromwell to his office of lord clerk register, and on Nov. 3 was made a commissioner for the administration of justice in Scotland. He sat in the upper chamber of Cromwell's parliament (Jan. 1658) and of Richard Cromwell's parliament; and on the latter's abdication and the restoration of the Rump, he was chosen a member of the council of State, and continued in the administration as a member of the committee of public safety.

At the Restoration he escaped abroad, and was condemned to death in his absence (May 13, 1661). In 1663 he was discovered at Rouen, and with the consent of Louis XIV. was brought over and imprisoned in the Tower. Taken to Edinburgh in June, and confined in the Tolbooth, he was hanged at the Market Cross on July 22. His head was exposed on the Netherbow and afterwards buried with his body in Greyfriars churchyard.

Johnston was a man of energy. His devotion to the Scottish Church amounted to fanaticism. He had by nature no republican leanings. When, however, Presbyterianism was attacked, he desired, like Pym, to restrict the royal prerogative. His acceptance of office under Cromwell hardly deserves the censure it has received. But in his dying speech he condemned the act as a fault which he had committed in order to provide for his numerous family. Johnston was wanting in consideration for his opponents. He was hated by Charles I., whose statecraft was vanquished by his inflexible purpose, and by Charles II., whom he rebuked for his dissolute conduct.

See W. Morison, *Johnston of Warriston* (1901); *Diary of Sir A. J. Warriston*, 1650–54, edit. by D. H. Fleming (Scottish Hist. Soc., 1919).

WARRNAMBOOL, a seaport of Victoria, Australia. It has a good artificial harbour formed by a breakwater, pier, etc. The town (pop. 8,100) is the market centre of a rich agricultural and dairying district (av. an. rainfall 26·18 in.) and farther inland lie the sheep-areas of western Victoria, but the policy of railway concentration upon Melbourne has deprived it of much trade.

WARSAW (Polish *Warszawa*), a province of Poland. Area, 11,313 sq. miles. Population (1921) without the city of Warsaw, 2,112,000, of whom 89·8% are Poles, 7·7% Jews and 2·2% Germans. The province of Warsaw, formerly the principality of Mazovia, is situated in the great central plain and drained by the Vistula and its affluents. In the north the Baltic uplands begin; in the south the province includes part of the southern plateau. The plain is sandy and not very fertile, and suffers much from the periodic inundations of the Vistula, particularly near the confluence of the Bug and Narew. But the thrifty Mazovian peasant has prosecuted the cultivation of the soil with considerable success. The principal crops are rye, oats, barley, wheat and potatoes, while beetroot is cultivated for sugar in some parts of the province. Gardening and bee-keeping are also practised. There are large forest areas particularly in the north where there are also wide marshes especially on the Wkra near Mlawa. The shipping of the Vistula is an important occupation, as are the agricultural industries: flour milling, distilleries, breweries and sugar factories. Saw mills and match factories and especially tanneries are important. There is an important industrial area including the metal industries, the manufacture of machinery, locomotives and other goods at Warsaw and the textile manufactures of Zyrardów, forming a link between Warsaw and Lodz.

The chief towns are Warsaw (*q.v.*), Plock (pop. 25,800), Wloclawek (pop. 40,300), Zyrardów, Gostynin, Grojec, Kutno, Nowo-Minsk, Plonsk, Radzymin, Skierniewice, Ciechanów, Lipno, Mlawa, Rypin, Pultusk and Przasnysz.

Mazovia was a semi-independent principality of Poland not finally united to Poland till 1529, when its numerous gentry played a great part in the democratic evolution of the Polish Constitution. The region has sent waves of colonists into East Prussia, Lithuania and even the Ukraine. The bishops of Plock originally had all Mazovia as their diocese, but to-day there is an archbishopric at Warsaw, which in the 16th century succeeded Plock as the capital city. Warsaw became the political centre of Poland when the advance of Germany in the west and Polish

colonization of Lithuania and the Ukraine threw the political centre of the State eastwards from Poznan and Cracow.

WARSAW, the capital of Poland and chief town of the province of Warsaw (Polish *Warszawa*). Area of the administrative district, 46 sq. miles. Pop. (1925) 1,002,196, of whom 33% were Jews, the rest nearly all Poles. It is beautifully situated on the left bank of the Vistula, 387 m. by rail E. of Berlin, and 695 m. S.W. of Leningrad. It stands on a terrace 120 to 130 ft. above the river, to which it descends by steep slopes, leaving a broad bench at its base. The suburb of Praga on the right bank of the Vistula, here 450 to 660 yd. broad, is connected with Warsaw by two bridges.

Situated in a fertile plain, on a great navigable river, below its confluence with the Pilica and Wieprz, which drain southern Poland, and above its confluence with the Narew and Bug, which tap a wide region in the east, Warsaw became in mediaeval times the chief entrepôt for the trade of those fertile and populous valleys with western Europe. Owing to its position in the territory of Mazovia, which was neither Polish nor Lithuanian, and, so to say, remained neutral between the two rival powers which constituted the united kingdom, it became the capital of both, and secured advantages over the purely Polish Cracow and the Lithuanian Vilna. The precise date of the foundation of the town is not known; but it is supposed that Conrad, duke of Mazovia, erected a castle on the present site of Warsaw as early as the 9th century. Casimir the Just is supposed to have fortified it in the 11th century, but Warsaw is not mentioned in annals before 1224. Until 1526 it was the residence of the dukes of Mazovia, but when their dynasty became extinct it was annexed to Poland. When Poland and Lithuania were united, Warsaw was chosen as the royal residence. Sigismund Augustus (Wasa) made it (1550) the real capital of Poland, and from 1572 onwards election of the kings of Poland took place on the field of Wola, on the western outskirts of the city. Charles Gustavus of Sweden took it in 1655 and kept it for a year; the Poles retook it in July 1656. Augustus II. and Augustus III. did much for its embellishment, but it had much to suffer during the war with Charles XII. of Sweden, who captured it in 1702; but in the following year peace was made, and it became free again. The disorders which followed upon the death of Augustus III. in 1763 opened a field for Russian intrigue, and in 1764 the Russians took possession of the town and secured the election of Stanislaw Poniatowski, which led in 1773 to the first partition of Poland. In Nov. 1794 the Russians took it again, after the bloody assault on Praga, but next year, in the third partition of Poland, Warsaw was given to Prussia. In Nov. 1806 the town was occupied by the troops of Napoleon, and after the peace of Tilsit (1807) was made the capital of the independent duchy of Warsaw; but the Austrians seized it on April 21, 1809 and kept possession of it till June 2, when it once more became independent. The Russians finally took it on Feb. 8, 1813. On Nov. 29, 1830, Warsaw gave the signal for the unsuccessful insurrection which lasted nearly one year; the city was captured after great bloodshed by Paskevich, on Sept. 7, 1831. Deportations on a large scale, executions, and confiscation of the domains of the nobility followed, and until 1856 Warsaw remained under severe military rule. In 1862 a series of demonstrations began to be made in Warsaw in favour of the independence of Poland, and after a bloody repression a general insurrection followed in Jan. 1863, the Russians remaining, however, masters of the situation. Executions, banishment to the convict prisons of Siberia, and confiscation of estates were carried out on an unheard-of-scale. Scientific societies and high schools were closed; monasteries and nunneries were emptied. Hundreds of Russian officials were called in to fill the administrative posts, and to teach in the schools and the university; the Russian language was made obligatory in all official acts, in all legal proceedings, and even, to a great extent, in trade. The very name of Poland was expunged from official writings, and, while the old institutions were abolished, the Russian tribunals and administrative institutions were introduced. The serfs were liberated. Much rioting and lawless bloodshed took place in the city in 1905–06.

In 1914 Warsaw became a great base for the supply of the Russian armies. In 1915 it was occupied by the Germans, who made it the capital of a Polish State, which possessed no real power. With the break-up of the German army in 1918 the Poles made themselves masters of the town and set up a government.

The streets of Warsaw are adorned with many fine buildings, partly palaces exhibiting the Polish nobility's love of display, partly churches and cathedrals, and partly public buildings erected by the municipality or by private bodies. Fine public gardens and several monuments further embellish the city. The university founded in 1816 but closed in 1832, was again opened in 1869 as a Russian institution, and is now again Polish; it has a remarkable library of more than 500,000 vols., rich natural history collections, a fine botanic garden and an astronomical observatory. The medical school enjoys high repute in the scientific world. The school of arts, the academy of agriculture and forestry, and the conservatory of music are all high-class institutions. The Association of the Friends of Science and the Historical and Agricultural societies of Warsaw were once well known, but were suppressed after the insurrections, though they are revived.

The theatre for Polish drama and the ballet is a fine building, which includes two theatres under the same roof; but the pride of Warsaw is its theatre in the Lazienki gardens, which were laid out (1767–88) in an old bed of the Vistula by King Stanislaw Poniatowski, and have beautiful shady alleys, artificial ponds, an elegant little palace with ceilings painted by Bacciarelli, several imperial villas and a monument (1788) to John Sobieski, king of Poland, who delivered Vienna from the Turks in 1683. Here an artificial ruin on an island makes an open-air theatre. Two other public gardens, with alleys of old chestnut trees, are situated in the centre of the city. One of these, the Saski Ogrod, or Saxon garden (17 acres), which has a summer theatre and fine old trees, is one of the most beautiful in Europe; it is the resort of the Warsaw aristocracy. The Krasinski garden is the promenade of the Jews.

The central point of the life of Warsaw is the former royal castle (Zamek Krolewski) on Sigismund square. It was built by the dukes of Mazovia, enlarged by Sigismund III. (whose memorial stands opposite) and Wladyslaw IV., and embellished by John Sobieski and Stanislaw Poniatowski. Most of its pictures and other art treasures were removed to St. Petersburg and Moscow but have been restored. Four main thoroughfares radiate from it; one, the Krakowskie Przedmiescie, the best street in Warsaw, runs southward. It is continued by the Nowy Swiat and the Ujazdowska Aleja avenue, which leads to the Lazienki gardens. Many fine buildings are found in and near these two streets: the church of St. Anne (1454), which belonged formerly to a Bernardine monastery; the agricultural and industrial museum, with an ethnographical collection; the monument (1898) to the national poet Adam Mickiewicz (1798–1855); the former Saxon palace, once the residence of the Polish kings; the Lutheran church, finished in 1799, one of the most conspicuous in Warsaw; the buildings of the Art Association, erected in 1898–1900; the university (*see* above); the church of the Holy Ghost (1682–96), with the heart and monument of the musician F. F. Chopin; a monument (1830) to the astronomer N. Kopernik (1473–1543); the palaces of the Zamoyski family (now the conservatory of music); the building of the Philharmonic Society (1899–1901); and the church of St. Alexander, built in 1826 and splendidly restored in 1891. The Ujazdowska Aleja avenue, planted with lime-trees and bordered with cafés and places of amusement, is the Champs Elysées of Warsaw. It leads to the Lazienki park and to the Belvedere palace (1822), and farther west to the Mokotowski parade ground, which is surrounded on the south and west by the manufacturing district. Another principal street, the Marszalkowska, runs parallel to the Ujazdowska from the Saxon garden to this parade ground, on the south-east of which are the barracks. The above-mentioned streets are crossed by another series running west and east, the chief of them being the Senators, which begins at Sigismund square and contains the best shops. The palace of the archbishop of Warsaw, the Bank of Poland; the town hall (1725), burned in 1863, but rebuilt in 1870; the small Pod Blacha palace, the theatre (1833); the old mint;

the beautiful Reformed church (1882); the Orthodox Greek cathedral of the Trinity, rebuilt in 1837; the Krasinski palace (1692), burned in 1782 but rebuilt; the church of the Transfiguration, a thank-offering by John Sobieski for his victory of 1683, and containing his heart and that of Stanislaw Poniatowski; and palaces are on or near Senators' Street and Miodowa Street.

To the west Senators' street is continued by Electors' street, where is the very elegant church (1849) of St. Charles Borromeo, and the Chlodna Street leading to the suburb of Wola, with a large field where the kings of Poland used to be elected. In Leszno street, which branches off from Senators' street, are the Zelazna Brama, or Iron Gate; in the market-place the bazaar, the arsenal and the Wielopolski barracks.

To the north of Sigismund square is the old town—Stare Miasto—the Jewish quarter, and farther north still the citadel. The old town very much recalls old Germany by its narrow streets and antique buildings, the cathedral of St. John, the most ancient church in Warsaw, having been built in the 13th century and restored in the 17th. The citadel, erected in 1832–1835 as a punishment for the insurrection of 1831, is of an antiquated type.

The suburb of Praga, on the right bank of the Vistula, is poorly built and often flooded; but the bloody assaults which led to its capture in 1794 by the Russians under Suvorov, and in 1831 by Paskevich, give it a name in history.

In the outskirts of Warsaw are various more or less noteworthy villas, palaces and battlefields. Willanow, the palace of John Sobieski, afterwards belonging to Count X. Branicki, was partly built in 1678–1694 by Turkish prisoners in a fine Italian style, and is now renowned for its historical relics, portraits and pictures. It is situated to the south of Warsaw, together with the pretty pilgrimage church of Czerniakow, built by Prince Stanislaw Lubomirski in 1691, and many other fine villas (Morysinek, Natolin, Krolikarnia, which also has a picture gallery, Wierzbno and Mokotow). Marymont, an old country residence of the wife of John Sobieski, and the Kaskada, much visited by the inhabitants of Warsaw, in the north, the Saska Kempa on the right bank of the Vistula, and the castle of Jablona down the Vistula are among others that deserve mention. The castle and forest of Bielany (4½ m. N.), on the bank of the Vistula, are a popular holiday resort in the spring.

Among the battlefields in the neighbourhood is that of Grochów where the Polish troops were defeated in 1831, and Wawer in the same quarter (E. of Praga), where Prince Joseph Poniatowski defeated the Austrians in the war of 1809; at Maciejowice, 50 m. up the Vistula, Kosciuszko was wounded and taken by the Russians in 1794; and the whole east bank of the Vistula was the scene of the great Polish victory over the Soviet armies in 1920. Warsaw is connected by six trunk lines with Vienna, Kiev and south-western Russia, Moscow, Leningrad, Danzig and Berlin. The steel industry has developed and the manufactures of plated silver, carriages, boots and shoes (annual turnover £8,457,000), millinery, hosiery, gloves, tobacco, sugar and house decorations are of importance, chiefly owing to the skill of the workers. The city has a trade in corn, leather and coal. The deportations of Warsaw artisans checked industrial progress. The population, nevertheless, grew rapidly from 161,008 in 1860, 276,000 in 1872 and 436,750 in 1887 to 756,426 in 1901; its growth since the war state has been remarkable. Warsaw is the seat of a Roman Catholic Archbishopric and of the Orthodox Metropolitan.

WAR STORE SURPLUSES: *see* DISPOSAL BOARD.

WART, a papillary new-growth of the skin, or mucous membrane. The ordinary flat warts of the skin occur mostly upon the hands of children and young persons; a long pendulous variety occurs about the chin or neck, and on the scalp in adults. Warts are apt to come out in numbers at a time; a crop of them suddenly appears, to disappear after a time with equal suddenness. Hence the supposed efficacy of charms. A single wart will sometimes remain when the general eruption has vanished. In adult life a wart on the hands or fingers is usually brought on by some irritation, often repeated, even if it be slight. Warts often occur on the wrists and knuckles of slaughter-house men and of those much occupied with anatomical dissection; they are often of tuberculous origin (butchers' warts). Chimney-sweeps and workers in coal-tar, petroleum, X-rays, etc., are subject to warts, which often become cancerous. Warts occur singly in later life on the nose or lips or other parts of the face, sometimes on the tongue; they are apt to become malignant especially if subjected to repeated irritation by attempts at their removal. Towards old age broad and flattened patches of warts of a greasy consistence and brownish colour often occur on the back and shoulders. They also are apt to become malignant. Indeed, warts occurring on the lip or tongue, or on any part of the body of a person advanced in life, should be suspected of malignant associations and dealt with accordingly. Venereal warts occur as the result of gonorrhoeal irritation or syphilitic infection.

The treatment of warts needs very careful consideration, and rarely, if ever, should be undertaken by a non-medical person, since, unfortunately, local applications of various kinds to warts have in many instances been accountable for their passage from a mere unsightly excrescence to an indubitable cancer.

WARTA, a river of Poland and Germany, and the chief affluent of the river Oder. It rises in the Carpathian mountains. Its total length is 445 m. and it is navigable up to Konin in West Poland, a distance of 265 m. Its banks are mostly low and flat, its lower course especially running through drained and cultivated marshes. It is connected with the Vistula through its tributary the Notec and the Bydgoszcz canal. The area of its drainage basin is 17,400 sq.m.

WARTBURG, THE, a castle near Eisenach in the grand-duchy of Saxe-Weimar. It is magnificently situated on the top of a precipitous hill, and is remarkable not only for its historical associations but as containing one of the few well-preserved Romanesque palaces in existence. The original castle, of which some parts—including a portion of the above-mentioned palace—still exist, was built by the Landgrave Louis "the Springer" (d. 1123), and from his time until 1440 it remained the seat of the Thuringian landgraves. Under the Landgrave Hermann I., the Wartburg was the home of a boisterous court to which minstrels and "wandering folk" of all descriptions streamed; Walther von der Vogelweide and Wolfram von Eschenbach both refer to the noise and constant crush of crowds passing in and out at the Wartburg "night and day"; and it was here that in 1207 took place the minstrels' contest (*Sängerkrieg*) immortalized in Wagner's *Tannhäuser*. Some years later it became the home of the saintly Elizabeth of Hungary (*q.v.*) on her marriage to Louis the Saint (d. 1227), to whom she was betrothed in 1211 at the age of four. Wagner, with a poet's licence, has placed the *Sängerkrieg* during Elizabeth's residence at the Wartburg. It was to the Wartburg, too, that on May 4, 1521, Luther was brought for safety at the instance of Frederick the Wise, elector of Saxony, and it was during his ten months' residence here that he completed his translation of the New Testament. From this time the castle was allowed gradually to decay. It was restored in the 18th century in the questionable taste of the period; but its subsequent magnificence it owed to the Grand-Duke Charles Alexander of Saxe-Weimar, with whom at certain seasons of the year it was a favourite residence.

AFRICAN WART HOG (PHACOCHOERUS)

WARTHE: *see* WARTA.

WART-HOG, the designation of certain hideous African wild swine (*see* SWINE), characterized by the presence of large warty protuberances on the face and the large size of the tusks in both sexes. The adults have frequently no teeth except those just mentioned, and nearly bare

skins. Two species are recognized, the southern *Phacochoerus aethiopicus*, which formerly ranged as far south as the Cape, and the northern *P. africanus*, which extends to the mountains of Abyssinia. In south and east Africa wart-hogs frequent open country, near water, and dwell in holes. In Abyssinia, they spend the day among bushes, or in ravines, feeding at night. They are active and wary.

WARTON, THOMAS (1728–1790), English poet-laureate was a son of Thomas Warton, vicar of Basingstoke and professor of poetry at Oxford. He was born on Jan. 9, 1728. In a poem written in 1745 he shows the delight in Gothic churches and ruined castles which inspired so much of his subsequent work in romantic revival. Most of Warton's poetry, humorous and serious—and the humorous mock-heroic was better within his powers than serious verse—was written before the age of twenty-three, when he took his M.A. degree and became a fellow of his college (Trinity, Oxford). He did not altogether abandon verse; his sonnets, especially, which are the best of his poems, were written later. But his main energies were given to omnivorous poetical reading and criticism. He was the first to turn to literary account the mediaeval treasures of the Bodleian Library. It was through him, in fact, that the mediaeval spirit which always lingered in Oxford first began to stir after its long inaction, and to claim an influence in the modern world.

Warton, like his brother, entered the church, and held one after another, various livings, but he did not marry. He gave little attention to his clerical duties, and Oxford always remained his home. In 1749 he published an heroic poem in praise of Oxford, *The Triumph of Isis*. He was a very easy and convivial as well as a very learned don, with a taste for pothouses and crowds as well as dim aisles and romances in manuscript and black letter. The first proof that he gave of his extraordinarily wide scholarship was in his *Observations on the Poetry of Spenser* (1754). Three years later he was appointed professor of poetry, and held the office for ten years, sending round, according to the story, at the beginning of term to inquire whether anybody *wished* him to lecture. The first volume of his monumental work, *The History of English Poetry* (3 vols. 1774–1781) is still indispensable to every student of English literature. A work of such labour could proceed but slowly, and it was no wonder that Warton flagged in the execution of it, and stopped to refresh himself with annotating (1785) the minor poems of Milton, pouring out in this delightful work the accumulated suggestions of forty years.

In 1785 he became Camden professor of history, and was made poet-laureate in the same year. His busy and convivial life was ended by a paralytic stroke in May 1790.

Warton's poems were collected in 1777, and he was engaged at the time of his death on a corrected edition, which appeared in 1791, with a memoir by his friend and admirer, Richard Mant. They were edited in 1822 for the *British Poets*, by S. W. Singer. Among his minor works were an edition of Theocritus (1770); a selection of Latin and Greek inscriptions; the humorous Oxford *Companion to the Guide* and *Guide to the Companion* (1762); *The Oxford Sausage* (1764); lives of Sir Thomas Pope and Ralph Bathurst, college benefactors; a *History of the Antiquities of Kiddington Parish*, of which he held the living (1781); and an *Inquiry into the Authenticity of the Poems attributed to Thomas Rowley* (1782).

The History of English Poetry from the close of the 11th to the Commencement of the 18th Century, to which are prefixed two Dissertations: I. On the Origin of Romantic Fiction in Europe; II. On the Introduction of Learning into England (1774–1781) was only brought down to the close of the 16th century. There are later editions, with annotations and corrections, by Richard Price (1824), and again by W. C. Hazlitt (1871). In both these editions other scholars collaborated.

Rinaker, *Thomas Warton: a biographical and critical study* (Illinois, 1916); *The Three Wartons; A Choice of their Verse* (1928), ed. Eric Partridge; J. Densin, *The Wartons; Studies in English Literature* (1876).

WAR TRADE ADVISORY COMMITTEE, in the World War, a British Government committee which advised it on the blockade. It succeeded and continued the work of the Restriction of Enemy Supplies committee (*q.v.*). It was appointed by the prime minister, H. H. Asquith, in Sept. 1915, with the marquess Francis Hopwood (afterwards Lord Southborough) became chairman on Feb. 25, 1916. It dealt, among other commodities, with coal, cotton, rubber and tin.

The subjects investigated included contraband, and what goods should be placed upon the contraband list; the prohibition of export and re-export from the United Kingdom and the British empire of goods intended for the enemy or likely to reach the enemy through neutral channels; agreements with responsible bodies in neutral countries for the consignment of imported goods under guarantee for the purpose that such supplies should not be re-exported to the enemy, *e.g.*, the Netherlands Oversea Trust in Holland, the Société de Surveillance Economique in Switzerland, and the Danish Merchants Guild in Denmark; recommendations in respect of the purchase in neutral countries adjacent to the enemy of native produce which otherwise would be available for export to the enemy; the surveillance and control of stores of commodities suspected of having been made for the ultimate benefit of the enemy. Difficult and intricate subjects were dealt with by the appointment of sub-committees.

Rationing Neutrals.—One of the most important questions dealt with by the committee was that of the "rationing" of foreign countries contiguous to the enemy to prevent them becoming bases of supply to the Central Powers. This was carried out by arrangements with responsible bodies in the countries affected, and provided for the prevention of the import of supplies in excess of the home requirements of the particular neutral country. The committee was also interested in matters relating to the preparation and administration of the "black list," and in connection with this subject special questions arose involving the abrogation of the Article 57 of the Declaration of London, the definition of "enemy," marine insurance, bills of lading, "to order," the use or abuse of facilities for the purpose of covering transactions of black-listed neutral traders, and consular certificates of origin given in neutral countries.

The contraband sub-committee was appointed on Sept. 6, 1915. In Aug. 1914, the British Government proclaimed that they would abide by the terms of the Declaration of London. It soon, however, became apparent that it would be necessary to enlarge the contraband list. The most important recommendation made was that of adding "gold, silver, paper money, securities, negotiable instruments, cheques, drafts, orders, warrants, coupons, letters of credit delegation or advice, credit or debit notes, or other documents, which in themselves, or if completed or if acted upon by the recipient, authorize, confirm or give effect to the transfer of money, credit or securities." A sub-committee considered oleaginous produce. In due course the Ministry of Blockade in parts superseded the Committee which, however, continued to do useful work. In all, the committee held 68 meetings.

See also BLOCKADE, MINISTRY OF: RATIONING (BLOCKADE); RESTRICTION OF ENEMY SUPPLIES COMMITTEE. (L. C. L.)

WAR TRADE DEPARTMENT. This important department of the British Government's economic war operations was formed early in 1915 and directed by the late Lord Emmott. To it were entrusted many matters connected with the blockade of Germany and the care of home supplies. It dealt with all applications for the grant of licences for the export of goods the subject of any official restriction or prohibition. At one and the same time it had oversight of the details of the blockade and the correlative supply of British services.

WARWICK, EARLS OF. The 1st earl of Warwick was HENRY DE NEWBURGH (d. 1123), lord of Newbourg in Normandy and son of Roger de Beaumont. He became constable of Warwick castle in 1068, and, though there is no proof that he actually came over with the Conqueror, his elder brother Robert de Beaumont, comte de Meulan, fought at Hastings. He apparently spent most of his time in Normandy, and was a baron of the Norman exchequer. He was created earl of Warwick early in the reign of William II. receiving a grant of the great estates of the Saxon, Thurkill of Arden, in Warwickshire. He founded the priory of the Austin Canons, and endowed the church

1297), left no heirs, and was succeeded by his sister Margaret, countess of Warwick in her own right, who was twice married, but left no heirs. Her second husband, John du Plessis, assumed the title of earl of Warwick in 1245, and in 1250 received a grant of his wife's lands for life. He was succeeded in 1263 by Countess Margaret's cousin and heir, SIR WILLIAM MAUDUIT (1220–1268), 8th earl of Warwick.

The Beauchamps.—Mauduit's sister and heiress, Isabel de Beauchamp, had apparently adopted the religious life at the time of her brother's death, and her son WILLIAM DE BEAUCHAMP became 9th earl of Warwick.

His son GUY DE BEAUCHAMP, 10th earl of Warwick (1278–1315), received grants of land in Scotland for his services at Falkirk, and in 1301 was one of the signatories of the letter to the pope denying the papal right to interfere in Scottish affairs. He was one of the lords ordainers of 1310, and was concerned in the capture of Gaveston, though he declined to countenance his execution. He died on Aug. 10, 1315. His son, THOMAS DE BEAUCHAMP, 11th earl (1313–1369), marshal of England in 1344, and of the English army in France in 1346, fought at Crecy and Poitiers, and was one of the original knights of the Garter.

THOMAS DE BEAUCHAMP, 12th earl (*c.* 1345–1401), was about 24 years old when he succeeded his father. He served on the lords' committee of reform in the Good Parliament in 1376, and again in 1377, and was a member of the commission of inquiry in 1379. Appointed governor to Richard II. in Feb. 1381, he joined the nobles who sought to impose their authority on the king, and was one of the lords appellant in 1388. After the overthrow of his party in 1389 Warwick lived in retirement, but although he had for the moment escaped Richard's vengeance he was not forgiven. Being invited with Gloucester and Arundel to a banquet at court on July 10, 1397 he alone of the three was imprudent enough to obey the summons. He was immediately arrested and imprisoned in the Tower of London, in that part of the fortress since known as the Beauchamp Tower. Warwick made a full confession in parliament; his honours were forfeited and he himself banished. He was again in the Tower in 1398, but was liberated and restored to his honours on the accession of Henry IV. His son Richard Beauchamp, 13th earl of Warwick, is separately noticed. HENRY, 14th earl of Warwick (1423–1445), Earl Richard's son, a descendant, through his mother Constance le Despenser, of Edmund, duke of York, fifth son of Edward III., received a patent making him premier earl in 1444. A year later he was created duke of Warwick with precedence next after the duke of Norfolk, a rank disputed by the duke of Buckingham. The assertion that he was crowned king of the Isle of Wight seems to have no foundation in fact. He died in his 22nd year, leaving a daughter Anne, who died in 1449.

On her death the earldom lapsed to the crown. The estates passed to Sir Richard Neville (*see* WARWICK, RICHARD NEVILLE, earl of), in right of his wife Anne, sister of Henry Beauchamp, duke of Warwick. He and his wife were created earl and countess of Warwick each for life in 1450, with remainder to Anne's heirs, and, these failing, to Margaret, countess of Shrewsbury, half-sister of the countess Anne. After the death of her husband, the Kingmaker, at Barnet in 1471, the rights of the countess, heiress of the Beauchamp estates, were set aside "as if the seid countes were nowe naturally dede" (act of 13 Edward IV. 1473) in favour of her daughters, Isabel, wife of George, duke of Clarence, and Anne, who, after the murder of her first husband Edward prince of Wales in 1471, married Richard, duke of Gloucester, afterwards Richard III. Their mother was allowed to resume her estates in 1487, but only to settle them on the crown. She was succeeded in 1493 in the earldom by her grandson Edward Plantagenet, 18th earl of Warwick (1475–1499), son of the duke of Clarence, and therefore the Yorkist heir to the crown. He was imprisoned in 1484, his sole offence being his birth, and was executed in 1499 on a charge of conspiracy with his fellow-prisoner, Perkin Warbeck. He was the last representative of the male line of the Plantagenets. His honours were forfeited, and his estates passed to his sister Margaret, countess of Salisbury in her own right, the unfortunate lady who was executed in 1541.

The next bearer of the title was John Dudley, Viscount Lisle, afterwards duke of Northumberland (*q.v.*), who was created earl of Warwick in 1547, on account of his descent from Margaret, countess of Shrewsbury, daughter of Richard Beauchamp, earl of Warwick. The earldom became extinct with his son John Dudley, 20th earl of Warwick (*c.* 1528–1554), who was condemned to death for having signed the letters patent making his sister-in-law, Lady Jane Grey, heir apparent. He was released from prison in Oct. 1554, but died in the same month. His brother, Ambrose Dudley (*c.* 1528–1590), who fought at St. Quentin in 1557, secured the reversal of the attainder of himself and his brother consequent on the attempt to place Lady Jane Grey on the throne, and in 1561 was created Baron Lisle and earl of Warwick. He was in high favour with Elizabeth, as was his third wife Anne, daughter of Francis Russell, 2nd earl of Bedford. His brother Robert, earl of Leicester, having predeceased him his honours became extinct on his death in 1590.

The earldom was revived in 1618 in favour of Robert Rich, 3rd Baron Rich (*c.* 1560–1619), grandson of Lord Chancellor Rich, who died shortly after his elevation. His wife Penelope, Lady Rich, is separately noticed. He was succeeded in 1619 by his eldest son Robert Rich, 2nd or 23rd earl of Warwick (*q.v.*), whose two sons Robert (1611–1659) and Charles (1619–1673) succeeded him in the earldom and died leaving no male issue. The 5th or 26th earl of Warwick was their cousin Robert Rich (1620–1675), eldest son of Henry, 1st earl of Holland. His grandson, the 7th or 28th earl, left no issue, and the title became extinct on the death, on Sept. 15, 1759, of his kinsman Edward Rich, 8th or 29th earl. It was revived two months later, when Francis Greville, Baron Brooke of Beauchamps Court (1719–1773), who had in 1746 been created Earl Brooke of Warwick Castle, became earl of Warwick. Greville was descended from Robert Greville, the 2nd baron, who was killed at Lichfield during the civil war and he represented a cadet branch of the Beauchamp family. The earldom has remained with his descendants, Francis Richard (b. 1853) becoming the 5th earl in 1893. His wife, Frances Evelyn, countess of Warwick, daughter of Colonel the Hon. C. H. Maynard (d. 1865), inherited the estates of her grandfather, Henry Maynard, 5th and last Viscount Maynard (1788–1865). She became well known in society, and later for her interest in social questions.

See F. R. C. G. G. Warwick, 5th Earl of, *Memories of Sixty Years* (1917); and Countess of Warwick, *A Woman and the War* (1916).

WARWICK, RICHARD BEAUCHAMP, EARL OF (1382–1439), son of Thomas Beauchamp, was born at Salwarp in Worcestershire on Jan. 28, 1382, and succeeded his father in 1401. He had some service in the Welsh War, fought on the king's side at the battle of Shrewsbury (1403) and at the siege of Aberystwith (1407). In 1408 he started on a pilgrimage to the Holy Land, visiting on his way Paris and Rome, and fighting victoriously in a tournament with Pandolfo Malatesta at Verona. From Venice he took ship to Jaffa, whence he went to Jerusalem, and set up his arms in the temple. On his return he travelled through Lithuania, Prussia and Germany, and reached England in 1410. Two years later he was fighting in command at Calais.

Up to this time Warwick's career had been that of the typical knight errant. During the reign of Henry V. his chief employment was as a trusted counsellor and diplomatist. He was an ambassador to France in September 1413, and the chief English envoy to the coronation of Sigismund at Aix-la-Chapelle, and to the council of Constance in the autumn of 1414. During the campaign of Agincourt he was captain of Calais, where in April 1416 he received Sigismund with such courtly magnificence as to earn from him the title of the "Father of Courtesy."

Warwick's sage experience made it natural that Henry V. should on his death-bed appoint him to be his son's governor. For some years to come he was engaged chiefly as a member of the council in England. In 1428 he received formal charge of the little king's education. He took Henry to France in 1430, and whilst at Rouen had the superintendence of the trial of Joan of Arc. In 1431 he defeated Pothon de Xaintrailles at Savignies. Next year he returned to England. The king's minority came

nominally to an end in 1437. Warwick was then chosen to succeed Richard of York in the government of Normandy. He died at his post there on April 30, 1439. His body was brought home and buried at Warwick. His tomb in St. Mary's church is one of the most splendid specimens of English art in the 15th century. (*See* also WARWICK, EARLS OF.)

BIBLIOGRAPHY.—Material is found in contemporary chronicles, and especially in the *Vita Henrici Quinti* ascribed to Elmham, Monstrelet; *Chronicles of London* (ed. C. L. Kingsford, 1905) and J. Stevenson, *Letters, etc., illustrative of the English Wars in France* ("Rolls" series, 1861–64). For modern accounts consult J. H. Wylie, *Henry IV.* (4 vols., 1884–98); C. L. Kingsford, *Henry V.* (N.Y., 1901); and Sir James Ramsay, *Lancaster and York* (1892); *see* also *The Pageants of R. B., Earl of Warwick,* reproduced in facs. fr. the Cottonian MS. (1908).

WARWICK, RICHARD NEVILLE, EARL OF (1428–1471), called "the king-maker," was eldest son of Richard Neville, earl of Salisbury, by Alice, only daughter and heiress of Thomas, the last Montacute earl of Salisbury. He was born on Nov. 22, 1428, and was betrothed in childhood to Anne, daughter of Richard Beauchamp, earl of Warwick. In 1449 she brought her husband the title and chief share of the Warwick estates. Richard Neville thus became the premier earl. In 1453 he became a member of the king's council. After the king's recovery in 1455 Warwick and his father took up arms in York's support. Their victory at St. Albans was due to the fierce energy with which Warwick assaulted and broke the Lancastrian centre. He was made captain of Calais; to his position there he owed his strength during the next five years. He distinguished himself in a great fight with Spanish ships off Calais on May 28, and in the autumn captured a German salt-fleet on its way to Lübeck, though England was at war neither with Castile nor with the Hanse. There was pretext enough for recalling him to make his defence. Whilst he was at the court at Westminster a brawl occurred between his retainers and some of the royal household. When a renewal of the war was imminent, Warwick crossed over to England with his trained soldiers from Calais under Sir Andrew Trollope. But at Ludlow on Oct. 12 Trollope and his men deserted, and left the Yorkists helpless. Warwick, with his father, his cousin the young Edward of York, and only three followers, made his way to Barnstaple. There they hired a little fishing vessel. The master pleaded that he did not know the Channel, and Warwick himself steered a successful course to Calais. During the winter Warwick held Calais, and sent out a fleet which seized Sandwich and captured Lord Rivers. In the spring he went to Ireland to concert plans with Richard of York. On his return voyage he encountered a superior Lancastrian fleet in the Channel. But Exeter, the rival commander, could not trust his crews and dared not fight.

From Calais Warwick, Salisbury and Edward of York crossed to Sandwich on June 26. A few days later they entered London, whence Warwick at once marched north. On July 10 he routed the Lancastrians at Northampton, and took the king prisoner. For the order to spare the commons and slay the lords Warwick was resonsible, as also for some later executions at London. Yet when Richard of York was disposed to claim the crown, Warwick appears to have decided the discussion in favour of a compromise, perhaps from loyalty to Henry, or perhaps from the wish not to change a weak sovereign for a strong. Warwick was in charge of London at the time when Richard and Salisbury were defeated and slain at Wakefield. The Lancastrians won a second victory at St. Albans on Feb. 17, 1461, possibly through lack of generalship on Warwick's part. He met Edward of York in Oxfordshire, brought him in triumph to London, had him proclaimed king, and within a month of his defeat at St. Albans was marching north in pursuit of the Lancastrians. The good generalship which won the victory of Towton may have been due to Edward rather than to Warwick, but the new king was of the creation of the powerful earl, who now had his reward. For four years the government was centred undisputedly in the hands of Warwick and his friends. The first check to the power of the Nevilles came with the announcement in September 1464 of the king's secret marriage to Elizabeth Woodville, when Warwick had just pledged Edward to a French match. Trouble began in 1466, when Edward first made Rivers, the queen's father, treasurer, and opposed an intended marriage between Warwick's daughter Isabel and George of Clarence, his own next brother. Still in May 1467 Warwick went again with the king's assent to conclude a treaty with France. He returned to find that in his absence Edward, under Woodville's influence, had committed himself definitely to the Burgundian alliance. Warwick began to plot in secret for his revenge. In the summer of 1469 he went over to Calais, where Isabel and Clarence were married without the king's knowledge. Meantime he had stirred up the rebellion of Robin of Redesdale in Yorkshire; and when Edward was drawn north Warwick invaded England in arms. The king, outmarched and outnumbered, had to yield himself prisoner, whilst Rivers and his son John were executed. But in March 1470 a rebellion in Lincolnshire gave Edward an opportunity to gather an army of his own. When the king alleged proof of Warwick's complicity, the earl fled with Clarence to France. There he was reconciled to Margaret of Anjou, and agreed to marry his second daughter to her son. In September Warwick and Clarence, with the Lancastrian lords, landed at Dartmouth. Edward fled oversea, and for six months Warwick ruled England as lieutenant for Henry VI., who was restored from his prison in the Tower to a nominal throne. But the Lancastrian restoration was unwelcome to Clarence, who joined Edward when he landed at Ravenspur in March 1471. Warwick was completely outgeneralled, and at Barnet on April 14 was defeated and slain.

Warwick's only children were his two daughters. Anne, the younger, was married after his death to Richard of Gloucester, the future Richard III.

BIBLIOGRAPHY.—For data *see* especially C. W. Oman's brilliant but enthusiastic *Warwick the King-Maker* (1891); Sir James Ramsay's *Lancaster and York* (1892); and Stubbs's *Constitutional History.*

WARWICK, SIR ROBERT RICH, 2ND EARL OF (1587–1658), colonial administrator and admiral, was the eldest son of Robert Rich, earl of Warwick (*q.v.*), and his wife Penelope Rich (*q.v.*), and succeeded to the title in 1619. His interest in colonial ventures involved him in disputes with the East India Company (1617) and with the Virginia Company, which in 1624 was suppressed through his action. In 1627 he commanded an unsuccessful privateering expedition against the Spaniards. His Puritan connections and sympathies, while estranging him from the court, promoted his association with the New England colonies. In 1628 he indirectly procured the patent for the Massachusetts colony, and in 1631 he granted the "Saybrook" patent in Connecticut. Compelled the same year to resign the presidency of the New England Company, he continued to manage the Bermudas Company, and Providence Company which, founded in 1630, administered Old Providence on the Mosquito coast. Meanwhile in England Warwick opposed the forced loan of 1626, the payment of ship-money and Laud's church policy, and with his brother the first Lord Holland (*q.v.*) came to be recognized as one of the heads of the Puritans. In March 1642 the Commons, in spite of the king's veto, appointed him admiral of the fleet, and in July he gained the whole navy for the parliament. He raised forces in Norfolk and Essex on the outbreak of the war, and as lord high admiral (1643–1645) he did good service in intercepting the king's ships and relieving threatened ports. In 1643 he was appointed head of a commission for the government of the colonies, which the next year incorporated Providence Plantations, atferwards Rhode Island, and in this capacity he exerted himself to secure religious liberty. He died on April 19, 1658.

WARWICK, county town of Warwickshire, England; on the Avon. Pop. (1921) 12,863.

Warwick (*Warwic, Warrewici, Warrewyk*) seems to have been an early settlement fortified later by Aethelflaed, against the Danes. At Domesday, Warwick was a royal borough, containing 261 houses, of which 130 were in the king's hands, while 19 belonged to burgesses enjoying the privileges they had had in the time of Edward the Confessor. The Conqueror granted the borough to Henry of Newburgh, who was created earl of Warwick, and in all probability built the castle on the site of Aethelflaed's fortification. The Beauchamps, successors of Henry of

Newburgh as earls of Warwick, held the borough of the king in chief. In the vicinity of Warwick is Guy's Cliffe, the hermitage of the first Guy, earl of Warwick. Although the borough owed its early importance to the castle of the earls of Warwick as well as to its position, and received a grant of a fair from John, earl of Warwick, in 1261, it seems to have developed independently of them, and received no charter until it was incorporated in 1546 after it had come into the king's hands by the attainder of Edward, earl of Warwick, in 1499. Other charters were granted in 1553, 1665, 1684 and 1694, of which that of 1553 allowed the appointment of assistant burgesses. This was discontinued in 1698. The charter of 1694 conferred the title of "Mayor, Aldermen and Burgesses" on the corporation.

The castle of the earls of Warwick stands on a rock above the river and includes a residential portion above the river as well as ruined towers of the 14th century and several parts of the ancient walls. There is a famous collection of pictures. The present church of St. Mary is a rebuilding after a fire in 1694. It appears from Domesday that a church existed before the Conquest. It was made collegiate by Roger de Newburgh, the second Norman earl, in 1123. At the Dissolution Henry VIII. granted the foundation to the burgesses of the town. The Beauchamp chapel survived the fire; it is of Perpendicular work, built between 1443 and 1464. There are only scanty traces of the old town walls, but the east and west gates remain, with chapels built above them. The priory of St. Sepulchre was founded by Henry de Newburgh and completed in the reign of Henry I., on the site of an ancient church, for a society of canons regular. It is now a private residence. Leicester Hospital, established by Robert Dudley, earl of Leicester, is a fine half-timber building. It was originally used as the hall of the united gilds of the Holy Trinity, the Blessed Virgin and St. George the Martyr. The earl of Leicester, by an act of incorporation obtained in 1571, founded the hospital for the reception of twelve poor men. Thomas Cartwright was the first master of this Hospital. St. John's Hospital, a foundation of the time of Henry II., is represented by a beautiful Jacobean mansion. There are numerous charities in the town, the principal being those of Henry VIII., Sir Thomas White and Thomas Oken. The first is devoted to ecclesiastical and municipal stipends and to the King's School. By the charity of Sir Thomas White a sum of money is lent to young tradesmen for a period of years. The King's School dates from the reign of Edward the Confessor. Warwick returned two members to parliament from 1295, but in 1885 the number was reduced to one. It has now no independent representation as a borough.

WARWICK, a town of Kent county, Rhode Island, U.S.A. Pop. (1920) 13,481 (22% foreign-born white) and 18,273 in 1925 (State census). It embraces several manufacturing villages and summer resorts. Warwick was settled in 1643 by Samuel Gorton (*q.v.*). In 1647 the settlement entered into a union with Providence, Newport and Portsmouth under the Warwick (or Williams) charter of 1644. Warwick was the birthplace of Gen. Nathanael Greene.

WARWICKSHIRE, a midland county of England. The area is 939·8 square miles. The river Avon, watering a rich valley on a line from north-east to south-west, divides the county into two unequal parts. The greater, lying to the north-west, drains principally to the Trent through the rivers Cole, Blythe, Rea, Anker and minor streams. Between these valleys, and dividing the system from that of the Avon, the land rises in gentle undulations. The land is formed for the most part of Keuper marls and sandstones, the sandstones forming picturesque scarps. The Bunter rocks are represented only between Birmingham and Sutton Coldfield. From this side the Avon receives the Swift, the Sowe and the Alne. An important fault crosses the area from Kenilworth northwards to Tamworth, and brings up the Coal-measures on the eastern side. The Upper Coal-measures, with the so-called Permian Beds, occupy the larger part of the Warwickshire Coalfield, whilst the productive Middle Coal-measures crop out in a narrow fringe along the north and east. The estimated reserves of coal are 1,126,981,000 tons. The eastern margin of the field is marked by an inlier of Cambrian and Pre-Cambrian rocks, the Hartshill quartzite (Cambrian) being extensively quarried. The northern district was distinguished by Camden as the Woodland, as opposed to the southern or Feldon, "a plain champain." The woodland embraced the ancient forest of Arden. The finest scenery is found on the banks of the Avon at Guy's Cliffe and Warwick Castle. It is not difficult to trace the influence of the scenic characteristics of the county in the writings of its most famous son, William Shakespeare.

Coal, ironstone, lime and cement are the chief mineral products; manganese ore was formerly got from the Cambrian rocks.

History and Early Settlement.—Warwickshire being the area once largely occupied by the Forest of Arden is poor in prehistoric antiquities though one find, of a palaeolithic implement at Saltley, gave rise to a good deal of discussion some years ago. (*See* Evans, *Ancient Stone Implements,* pp. 522 and 578.) The Fosse Way cut across the south-east of the county and Watling street touched it in the north. The earliest English settlers in the district were a tribe of Hwiccas who, pushing up the Severn valley early in the 6th century, made their way by the Avon valley and the Roman Fosse Way, the extent of their settlement being indicated by the ancient limits of the diocese of Worcester. Humphreys' recent (*Archaeologia,* 1922–3, vol. lxxiii.) discoveries at Bidford-on-Avon have demonstrated these points. The vast forest of Arden, from the Avon to modern Birmingham, barred progress northwards. It was only after the battle of Cirencester in 628 that the whole of the Hwiccan territory was comprised in Mercia. In 675 Cosford was included in the endowment of Peterborough, and in 757 Aethelbald was slain at Seckington in a battle with the West Saxons. The shire of Warwick originated in the 10th century about Aethelflaed's new burgh at Warwick, and appears in the *Saxon Chronicle* of 1016.

The shire offered little resistance to the Conqueror, who was at Warwick in 1068, and the Thurkill family kept its lands and took later on the name of Arden. A fortress built by Thurkill was entrusted by William to Henry, son of Roger de Beaumont, afterwards earl of Warwick, and Robert, count of Meulan, Henry's elder brother. Coventry Minster was richly endowed. The earldom and castle of Warwick subsequently passed to the Beauchamps, and in the reign of Henry VI. to the Nevilles.

In the 13th century Warwickshire included the deaneries of Warwick and Kineton within the archdeaconry and diocese of Worcester; the rest of the county constituting the archdeaconry of Coventry within the Lichfield diocese. Both Coventry and Birmingham have been made separate sees in the 20th century.

In the wars of the reign of Henry III. Simon de Montfort placed Kenilworth Castle in charge of Sir John Giffard, who in 1264 attacked Warwick Castle and took prisoner the earl and countess of Warwick, who had supported the king. During the Wars of the Roses the Nevilles, represented by the earl of Warwick, supported the Yorkist cause, while Coventry was a Lancastrian stronghold. On the outbreak of the Civil War of the 17th century Warwickshire and Staffordshire were associated for the parliament under Lord Brooke. The battle of Edgehill was fought in 1642, and in 1643 Birmingham was sacked by Prince Rupert. Coventry endured a siege in 1642, and skirmishes took place at Southam and Warwick.

Warwickshire returned two members to the parliament of 1290, and in 1295 Coventry and Warwick were each represented by two members. Tamworth returned two members in 1584. Under the Reform Act of 1832 the county returned four members in two divisions; Birmingham was represented by two members, and Tamworth lost its members. Under the Act of 1868 the representation of Birmingham was increased to three members, and under the Act of 1918 the county returns four members in four divisions, Birmingham twelve members and Coventry one.

Architecture.—Of pre-Norman architecture some traces appear in the fine church of Wootton Wawen in the Arden (western) district. Saxon remains have been found in several places, as near Bensford Bridge on Watling street. For ecclesiastical architecture Coventry with its three spires is famous, and among village churches there are many fine examples. Of those retaining Norman portions may be mentioned: Wolston, Berkswell, Poles-

worth, Curdworth, Burton Dassett, a very noteworthy building, and Warmington, where there is a remarkable specimen of an anchorite's chamber. There are also fine examples of Decorated work, such as Knowle, Solihull, Temple Balsall and Brailes. Among the numerous religious houses in the county several have left remains. Such are the Cistercian foundations of Coombe Abbey, Merevale and Stoneleigh. This abbey was a 12th-century foundation, but a majestic gatehouse of the 14th century also stands. Maxstoke Priory was a foundation for Augustinian canons of the 14th century. Wroxall Abbey was a Benedictine nunnery of the 12th century. Warwick Castle and Kenilworth Castle, the one still a splendid residence, the other a no less splendid ruin, are described under those towns. At Hartshill there is a fragment of a Norman castle. Among fortified mansions Maxstoke Castle is of the 14th century; Baddesley Clinton Hall is of the 15th; Astley Castle is another good specimen of the period. Compton Wynyates, once fortified, is a beautiful Elizabethan house. Charlecote Park is a modernized Elizabethan hall in an exquisite situation on the Avon above Stratford.

Agriculture and Industries.—The climate is mild and healthy. The soil is on the whole good, and consists of various loams, marls, gravels and clays, well suited for most of the usual crops. It is rich in pasture-land, and dairy-farming is increasing. It has excellent orchards and market-gardens, and possesses some of the finest woodlands in England.

The industrial part of the county is the northern. Warwickshire includes the greatest manufacturing centre of the Midlands —Birmingham, though the suburbs of that city extend into Staffordshire and Worcestershire. Metal-working in all branches is prosecuted here, besides other industries. Coventry is noted for motor cars and cycle-making, and, with Bedworth and Nuneaton and the intervening villages, is a seat of the ribbon- and tape-makers. A small rich coalfield occurs in the north-east, extending outside the county northward from Coventry. Clay, limestone and other stone are quarried at various points, and an appreciable amount of iron ore is raised.

Population and Administration.—The area of the ancient county is 577,462 ac., with a population in 1901 of 897,835 and in 1921 of 1,389,977, the chief centres of increase lying naturally in the parts about Birmingham and Coventry. The area of the administrative county is 605,275 acres. It has one court of quarter sessions, and is divided into 21 petty sessional divisions. The boroughs of Birmingham, Coventry and Royal Leamington Spa have separate commissions of the peace, and the boroughs of Birmingham and Warwick have separate courts of quarter sessions. The county is mainly in the Birmingham and Coventry dioceses, carved largely out of that of Worcester. Warwickshire has four parliamentary divisions—Tamworth, Nuneaton, Rugby and Warwick and Leamington, each returning one member. The parliamentary borough of Coventry returns one member and that of Birmingham has twelve divisions, each returning one member.

Bradley, *The Avon and Shakespeare's county* (1913); J. C. Cox, *Warwickshire* (1923); W. H. Duignan, *Warwickshire Place-names* (1912); M. D. Harris, *Unknown Warwickshire* (1922); and *Victoria County History, Warwickshire*.

WASH, THE, a shallow bay of the North sea, Lincolnshire and Norfolk coast of England. Roughly square, it has an area of about 350 sq.m. Through sandbanks which form its bed there are two main channels into deep water; one, Boston Deeps, kept open by the waters of the Witham and Welland; the other, Lynn Deeps, by the Nene and the Great Ouse. The Wash is the remnant of a much larger bay, which covered a large part of the Fens; it is gradually being filled with sediments and from time to time small portions are reclaimed (*see* FENS). The flat bordering lands are protected by sea-walls. The formerly dangerous passage of the marsh-lands, which were liable to irruptions of the tide, is illustrated by the accident to King John in 1216.

WASHBURN, a city of Wisconsin, U.S.A. Pop. (1920) 3,707. It has a fine site on high land above Lake Superior.

Among the manufactures are powder and dynamite, lumber and excelsior. There are brownstone quarries near by. In 1665 Father Allouez established the first French mission in Wisconsin on the shore south of the present city ("La Pointe du Saint Esprit"), and in 1669 it was placed in charge of Father Marquette. The fur trader, Le Sueur, built a stockaded post here in 1693; in 1718 the French erected a fort; and about 1820 the American Fur Company established a post in the neighbourhood. The present city (named after Governor C. C. Washburn) was founded about 1879 and chartered in 1904.

WASHBURNE, ELIHU BENJAMIN (1816–1887), American statesman, born in Livermore, Me., Sept. 23, 1816. He was one of seven brothers, of whom four sat in Congress from as many different States. He graduated at the Harvard Law school in 1839, and was soon afterwards admitted to the bar. In 1840 he removed to Galena, Ill. He was elected to Congress in 1852, where, first as a Whig and afterwards as a Republican, he represented his district continuously until 1869, taking a prominent part in debate, and earning the name "watch-dog of the Treasury" by his consistent and vigorous opposition to extravagant and unwise appropriations. He contributed much to aid General Grant during the Civil War, and the latter on becoming president made Washburne secretary of State. On account of ill-health, however, he served only 12 days, and was then appointed minister to France. In 1877 he retired and died in Chicago, Ill., Oct. 22, 1887. He published *Recollections of a Minister to France* (1887), and *The Edwards Papers* (1884).

See Gaillard Hunt, *Israel, Elihu and Cadwallader Washburne* (1925).

WASHING MACHINES. Although household washing machines—mechanical devices for washing clothes—have been used for many years, it was not until the World War that these devices came into general popularity. Mechanical clothes washers trace their origin to the first crude tub with corrugated sides and bottom that revolved on an axis and was propelled by hand and to the stick with a tin pan or cup attached to one end that was plunged up and down in a tub full of clothes. Such mechanical means of washing date back over half a century. Modern mechanical clothes washers are of six general types—agitator or gyrator, cylinder, vacuum cup, oscillator, dolly and flowing or circulating water-type.

The *agitator* or *gyrator washer* employs a rotating and reversing disc, usually made of aluminium with one or more fins mounted on its upper side. This disc is placed in the bottom of the tub, operates from a driving mechanism placed underneath and forces the hot soapy water through the fabric. The agitator washer is generally acknowledged to be the fastest type available and the most popular.

The *cylinder washer* uses a metal or wooden cylinder that rotates in one direction, or rotates in one direction a predetermined number of revolutions varying from one to six, and then reverses. The moving cylinder, which is either perforated or constructed of slats, is contained in an outer shell or tub of metal or wood.

The *vacuum-cup washing machine* utilizes one or more circular or square cups—usually two or three—made of copper or aluminium, which are forced up and down in the water with a radial movement. In this type of machine, washing is accomplished by air pressure and suction.

In the *oscillator type* either a perforated container holding the clothes is rocked back and forth in the tub, or the tub itself is rocked. The oscillator and cylinder types of washing machine are the most gentle in their action.

The *dolly clothes washer,* one of the oldest types, has a rotating and reversing disc equipped on the bottom with fins or pegs. This disc is operated through the top of the tub. The dolly disc catches and holds the clothes while they are being forced through the water.

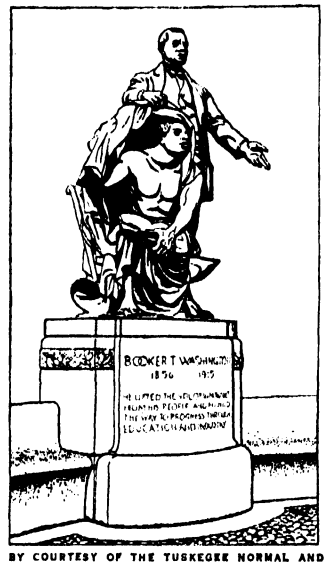
In the *flowing or circulating water type* washing machine, water is usually introduced into the tub under pressure, and the clothes are stirred around by the movement of the water.

Wood is still employed for the tubs in washing machines, although it has largely given way to copper, tinned copper, copper that is nickel-plated, galvanized iron, galvanized steel, aluminium, zinc and vitreous enamel. The tubs, which are made in a variety of shapes including circular, square and octagon, have a

capacity ranging from five to ten sheets, the average being six sheets or nine pounds of clothes. However, there are a number of small capacity portable washing machines available. There are also clothes washing machines without tubs.

Wringers or Dryers.—There are two general types of clothes wringers or dryers which are used on these clothes washers. Most washers are equipped with a mechanically-driven metal or wooden wringer, with two parallel rubber rolls, that revolve in opposite directions to squeeze the water from the clothes. While most of these wringers have two hard rubber rolls, there is a tendency to use one hard and one soft rubber roll, or two soft rolls. The purpose of the soft rubber roll is to eliminate the breakage of buttons. The wringers usually can be swung around to five or more positions and locked there. The other form of clothes dryer is the centrifugal dryer, spinner or extractor, which is similar to the extractors used in commercial laundry work. These dryers or extractors consist of perforated metal cylinders, driven at high speed so as to throw off the water contained in the clothes. This dryer may be in a separate compartment or the washing may take place in the dryer compartment.

Operation of Machine.—Opinions as to the proper operation of mechanical clothes washers differ among household economists. It is generally agreed, however, that soiled clothes should be sorted into four major groups and each group washed separately. White clothes such as table linen, bed linen, towels and body linen form one group. Clothes with fast colours form the second group. Coloured fabrics with "fugitive" colours or colours of doubtful permanence form the third group and require low temperatures in washing and rinsing and rapid drying. Miscellaneous pieces such as silks, woollens, blankets and rugs also require individual attention. Clothes should be soaked overnight before being placed in the washer or the washer tub should be filled with cold water, the clothes inserted and the machine operated without the use of soap or washing compounds for five minutes.



For washing, water of from 135° to 140° F is usually employed with 1¼ to 4 ounces of soap. The kind and form of soap used depends upon the condition of the clothes and upon the hardness or softness of the water available. The machine should be operated from ten to fifteen minutes, depending on the type of machine and the condition of the clothes. The washing operation should be followed by two scalding rinses in water 160° to 180° F with the machine operating from ten to fifteen minutes for each rinse. The hot rinses are followed by a cold rinse of ten minutes' duration. Bluing the clothes, if desired, follows the cold rinse.

Recent developments (1929) in the washing machine field include greater application of safety devices, such as the employment of instant releases on wringers and the enclosure of all accessible moving parts; improved gears, bearings and lubricating means; the use of materials and finishes that are more easily kept clean by the housewife; and the development of machines for permanent installation in stationary laundry tubs. Perhaps the most important development is the two-tub washer, one compartment housing the washing mechanism and the other containing the clothes dryer or extractor which replaces the roll wringer, both mechanisms being operated from the same motor.

In the year 1928 approximately 13,000 water-power clothes washers, 64,000 hand-power washing machines, 103,000 gas and power washers, and 810,000 electric motor driven washing machines were produced in the United States alone. Surveys show that the electric clothes washing machine is the third most popular electrical household appliance in America, being exceeded only by the flatiron and vacuum cleaner. It is estimated that of the 19,000,000 American homes equipped with electric service, approximately 5,735,000 own electric clothes washing machines. (A. P. Hi.)

WASHING SODA. The soda crystals commonly known by this name, and so largely used in household and laundry work, consist of sodium carbonate combined with water. (*See* Alkali.)

WASHINGTON, BOOKER TALIAFERRO (*c.* 1859–1915), American negro teacher and reformer, was born on a plantation in Franklin county, Virginia. Soon after the Civil War he went to Malden, W.Va., where he worked in a salt furnace and then in a coal mine. He obtained an elementary education at night school, and became a house servant in a family where his ambition for knowledge was encouraged. In 1872 "by walking, begging rides both in wagons and in the cars" he travelled 500m. to the Hampton (Va.) Normal and Agricultural institute, where he remained three years, working as janitor for his board, and graduated in 1875. For two years he taught at Malden, his former home, and studied for eight months (1878–79) at the Wayland seminary in Washington, D.C. In 1879 he became instructor at the Hampton institute, where he trained about 75 American Indians with whom Gen. S. C. Armstrong was carrying on an educational experiment, and he developed the night school, which became one of the most important features of the institution. In 1881 he was appointed organizer and principal of a negro normal school at Tuskegee, Ala. (*q.v.*), for which the State legislature had made an annual appropriation of $2,000. Opened in July, 1881, in a little shanty and church, the Tuskegee Normal and Industrial institute became, under Washington's presidency, the foremost exponent of industrial education for the negro. In the first 19 years of the school's existence 40 buildings were erected, all but four largely by student labour, and student labour also provided other necessities. To promote the interests of the school and to establish better understanding between whites and blacks, Washington delivered many addresses throughout the United States, notably a speech in 1895 at the opening of the Atlanta Cotton States and International Exposition. In 1900 at Boston, Mass., he organized the National Negro Business League. Harvard conferred upon him the honorary degree of A.M. in 1896, and Dartmouth that of LL.D. in 1901. He died at Tuskegee on Nov. 14, 1915, as the result of overwork.

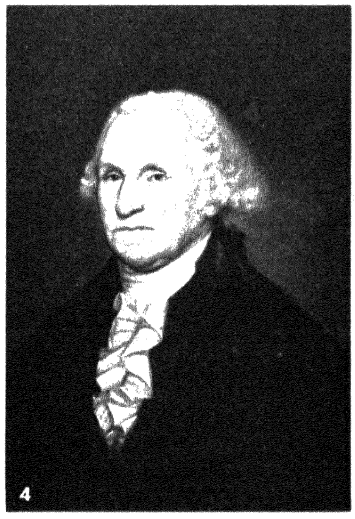
Among his publications are *The Future of the American Negro* (1899); *Sowing and Reaping* (1900); *Up from Slavery* (1901), a strong autobiography; *Character Building* (1902); *Working with the Hands* (1904); *Tuskegee and its People* (1905); *Putting the Most into Life* (1906); *Life of Frederick Douglas* (1907); *The Negro in Business* (1907); *The Story of the Negro* (1909); *My Larger Education* (1911); and *The Man Farthest Down; a Record of Observation and Study in Europe* (1912).



WASHINGTON, BUSHROD (1762–1829), American jurist, nephew of George Washington, was born in Westmoreland county, Va., on June 15, 1762. He graduated in 1778 at the College of William and Mary, where he was an original member of the Phi Beta Kappa Society. He served in the House of Delegates in 1787, and in the following year sat in the convention which ratified for Virginia the Federal Constitution. In 1798 he was appointed an associate justice of the United States Supreme Court by President John Adams. He was George Washington's literary executor, and supervised the preparation of John Marshall's *Life of Washington* (5 vols., 1804–07); and on Mrs. Washington's death in 1802 he inherited Mt. Vernon and a part of the estate. He died in Philadelphia on Nov. 26, 1829.

WASHINGTON, GEORGE (1732–1799), general, statesman and first president of the United States, was born at Bridges Creek, near Fredericksburg, in Westmoreland county, Va., on Feb. 22 (old style Feb. 11), 1732. His father was Augustine Washington, who had gone to school in England, had tasted seafaring life, and was now managing his large Virginia estates. On the paternal side the family traced its lineage to Sulgrave, Northamptonshire,

England, from which Washington's great-grandfather, John Washington, had emigrated in 1657, settling at Bridges Creek and becoming a member of the Virginia house of burgesses. Little is known of any member of the family till the time of Washington's father, Augustine, who was a man of energy, at one time part owner of an iron mine and smelter near Fredericksburg, and active in managing lands both at Hunting Creek (now Mount Vernon) on the Potomac, and on the Rappahannock. Augustine was married twice, first to Jane Butler, who bore him four children, and after her death to Mary Ball, the first of whose six children was George.

Childhood.—Little has been recorded of Washington's childhood in the small four-room farm house on the Rappahannock, a fact which invited Mason L. Weems's absurd fictions regarding the hatchet and cherry tree, and his repugnance to fighting. Till the fall of 1747 he irregularly attended school, first with the local church-sexton, and later with a schoolmaster named Williams. There is evidence that he studied a little Latin; his copy-book, with the moral precepts or *Rules of Civility* which he transcribed at fourteen, was carefully preserved. At a later date he taught himself a good deal of mathematics. His chief education, however, was received from practical men and outdoor occupations, not from books. His father owned six different plantations, of which Washington knew best that at Bridges Creek. Here he rode, watched the slaves at labour, mastered the routine of tobacco-growing and stock-raising. He early learned the elements of surveying, and at the age of 14 was able to plot and measure the fields of his brothers and neighbours.

Early Activities.—Washington's father, dying when the boy was 11, left him under the guardianship of his half-brother Lawrence, who with the other surviving son of the first marriage, Augustine, inherited nearly all of the estate. Thenceforth he lived chiefly with Lawrence at Mount Vernon, though for a time he was at Bridges farm with Augustine. The old story that Admiral Edward Vernon (after whom Mount Vernon was named) offered him the post of midshipman is apocryphal. His half-brother Lawrence, who was a gentleman of fashion and education, married to a daughter of the wealthy and well-born William Fairfax, had served in the attack upon Cartagena in 1741 with Vernon, and doubtless knew that admiral well; but there is no evidence that Vernon interested himself in Washington. The lad turned instead to surveying as a profession. In 1746 Thomas, Lord Fairfax, a middle-aged bachelor who owned more than five million acres in northern Virginia and the Shenandoah valley, came to America to live with his cousin William at Belvoir on the Potomac, adjoining Mount Vernon. He was a man of culture, a former associate of Addison and Steele, and added much to the society of the section. Wishing to protect his lands, on which squatters from Pennsylvania were settling, he sent off to the Shenandoah in March, 1748, a surveying party which Washington accompanied as assistant-surveyor. On this western journey Washington kept a disjointed, ill-spelt diary, which contains some lively touches. He describes the discomfort of sleep under "one thread Bear blanket with double its Weight of Vermin such as Lice Fleas &c"; an encounter with a war party of Indians bearing a scalp; the Pennsylvania-German emigrants, "as ignorant a set of people as the Indians they would never speak English but when spoken to they speak all Dutch"; and the serving of roast wild Turkey on "a Large Chip," while "as for dishes we had none."

After his return, Washington was assisted by Lord Fairfax to obtain the position of public surveyor for Fairfax county, his commission from William and Mary college being dated July, 1749; and for more than two years he was kept almost constantly busy. His surveying trips carried him far beyond the Tidewater region into the western wilderness, taught him resourcefulness and endurance, and toughened his character. In addition, they gave him an interest in western lands, and an appreciation of the importance of western development, which endured throughout his life. He was always disposed to speculate in western holdings, and to view favourably projects for opening and colonizing the west. Lord Fairfax shortly removed into the Shenandoah valley and built there a log mansion called Greenway court, after his English estate; here Washington was frequently entertained, and had access to a large library, including contemporary English novels.

Plantation Life.—The year 1752 marked a turning point in Washington's life, for that summer his half-brother Lawrence died at Mount Vernon of tuberculosis, making George the executor of his will and residuary heir of his estate in the event that his daughter Mildred died—as she did within ten years—without issue. At the age of 20 Washington thus became manager of a large plantation. The previous year he had accompanied Lawrence on a trip for his health to the Barbados, and had there contracted smallpox, which left his face permanently pitted. This was the only occasion upon which Washington left the borders of the United States. For the next 20 years the main background of his life was the work and the social life of Mount Vernon. He was fond of riding, of fox-hunting, of dancing, of such theatrical performances as offered themselves and, despite an unconquerable awkwardness with the fair sex, of flirtation. Being now fully 6 ft. tall, and heavily built, with hands and shoulders of unusual size, he excelled in all outdoor pursuits, from wrestling to horse-breaking. In 1752 he was made adjutant of one of Virginia's four military districts, with an annual salary of £100 and not too onerous duties. He rapidly became prominent in community affairs, was an active member and later vestryman of the Episcopal Church, and was known as a strict and sagacious manager of his plantation. As early as 1748 he had begun patenting or buying lands, adding farm after farm to his holdings, till by 1757 he had more than 4,000 ac. to care for with white and slave labour.

Early Military Career.—Washington's entry into military life was not long delayed. In 1753 Gov. Dinwiddie of Virginia found it necessary to warn the French to desist from their encroachments on Ohio valley lands claimed by the British Crown, and after sending one messenger who failed to reach his goal, determined to despatch Washington. On the day he received his commission, Oct. 31, 1753, he set out for the French posts with a party comprising Jacob Van Braam, a Dutch fencing-master, as his interpreter, the scout Christopher Gist as guide, two servants, and two traders. His post of adjutant-general of the colony gave him the rank of major. The party left what is now Cumberland, Md., the middle of November, and despite wintry weather reached Ft. Leboeuf, at what is now Waterford, Pa., 20 m. south of Lake Erie, without delay. The French commander, Legardeur de St. Pierre, received him with courtesy, but "they told me," wrote Washington later, "that it was their absolute Design to take possession of the Ohio, and by God, they would do it"; and they gave Washington a letter to Dinwiddie with the same message. Returning homeward, Washington and Gist met a party of Indians, who fired at them at 15 paces, but missed; and in floating down the Allegheny on a raft, the major was jerked into the ice-filled stream, but "fortunately saved myself by catching hold of one of the Raft Logs." They were at Williamsburg on Jan. 16, 1754, where Washington wrote a report. Dinwiddie, who was labouring to convince the Crown of the seriousness of the French threat, had it printed and sent to London, where it was reprinted, and he appointed Washington lieutenant-colonel of a provincial regiment under Col. Joshua Fry. The governor at once launched into what may be called Dinwiddie's war against the French, and sent Washington and Fry with several hundred men against the enemy on the Ohio.

In this preliminary campaign of the French and Indian war Washington played a brave but by no means brilliant part. He marched with the advance guard to Cumberland, there learning that the French had occupied the fort of the Ohio company on the present site of Pittsburgh, renaming it Ft. Duquesne. Nevertheless he struggled forward hesitantly to within about 40 m. of the French position, and erected a weak fort at Great Meadows, near what is now Confluence, Pa. With this as a base, he made a surprise attack May 28, 1754, upon an advance detachment of 30 French, killing the commander, Coulon de Jumonville, and nine others, and making the rest prisoners. This brought the whole French force upon him. They drove Washington's 350 men into the Great Meadows fort (Ft. Necessity) on July 3, besieged it with 700 men, and after nine hours compelled him to surrender. The construction of the fort was a blunder, for it lay in a water-

logged creek bottom, was commanded on three sides by forested elevations approaching it closely, and was too far from Washington's supports. The French agreed to let the disarmed colonials march back to Virginia with the honours of war, but they compelled Washington to promise that Virginia would not build another fort on the Ohio for a year, and to sign a paper acknowledging responsibility for *"l'assassinat"* of M. de Jumonville; a word which Washington later explained he did not rightly understand. He returned to Virginia, chagrined but proud, to receive the thanks of the house of burgesses, to be made a colonel by Dinwiddie and to find his name mentioned in the London gazettes. His remark in a letter to his brother that "I have heard the bullets whistle; and believe me, there is something charming in the sound," was commented on humorously by Horace Walpole and sarcastically by George II.

An Aide to Braddock.—The arrival of General Edward Braddock and his army in Virginia in Feb. 1755, as part of the triple plan of campaign which called for his advance on Ft. Duquesne, Governor Shirley's capture of Niagara, and William Johnson's capture of Crown Point, brought Washington new opportunities and responsibilities. He had resigned his commission in Oct. 1754, in resentment of the slighting treatment and underpayment of colonial officers, and in especial of an untactful order of the British War Office that provincial officers of whatever rank should be subordinate to any officer holding the king's commission. But he ardently desired a part in the war; "my inclinations," he wrote a friend, "are strongly bent to arms." When Braddock showed appreciation of his merits and invited him to join the expedition as personal aide-de-camp, with the courtesy title of colonel, he therefore accepted. His self-reliance, decision and masterful traits were quickly made as plain as his wilderness experience. At table he had frequent disputes with Braddock, who when contractors failed to deliver their supplies attacked the colonials as supine and dishonest, while Washington defended them with warmth. His freedom of utterance is proof of Braddock's esteem. Braddock also accepted from him the unwise advice that he divide his army, leaving half of it to come up with the slow wagons and cattle-train, and taking the other half forward against Ft. Duquesne at a rapid pace. Washington was ill with fever during June, but joined the advance guard in a covered wagon on July 8, begged to lead the march on Ft. Duquesne with his Virginians and the Indian allies, and was by Braddock's side when on July 9 the army was ambushed and bloodily defeated.

In this defeat Washington displayed the combination of coolness and determination, the alliance of unconquerable energy with complete poise, which was the secret of so many of his successes. So ill that he had to use a pillow instead of a saddle, and that Braddock ordered his body servant to keep special watch over him, he was everywhere at once. At first he followed Braddock as the general bravely tried to rally his men to push either forward or backward, the wisest course the circumstances permitted. Then he rode back to bring up the Virginians from the rear, and rallied them with effect on the flank. To him was largely due the escape of the force. His exposure of his person was as reckless as Braddock's, who was fatally wounded on his fifth horse; Washington had two horses shot under him and his clothes cut by four bullets without being hurt. He was at Braddock's death-bed, helped bring the troops back, and was repaid by being appointed, in Aug. 1755, while still only 23 years old, commander of all the Virginia troops. But no part of his later service was conspicuous. Finding that a Maryland captain who held a royal commission would not obey him, he rode north in Feb. 1756, to Boston, to have the question settled by the commander-in-chief in America, Gov. William Shirley; and bearing a letter from Dinwiddie, had no difficulty in carrying his point. On his return he plunged into a multitude of vexations. He had to protect a weak, thinly settled frontier nearly 400 m. in length with only some 700 ill-disciplined colonial troops, to cope with a legislature unwilling to support him, to meet attacks on the drunkenness and inefficiency of the soldiers, and to endure constant wilderness hardships. It is not strange that in 1757 his health failed, and in the closing weeks of that year he was so ill of a "bloody flux" that his physician ordered him home to Mount Vernon. He recovered sufficiently to command the advance guard of Gen. John Forbes when in 1758 that general marched from Virginia upon Ft. Duquesne, triumphantly captured it, and renamed it Ft. Pitt; but this done, near the end of the year he resigned.

His Marriage.—Immediately after the surrender of his commission occurred his marriage Jan. 6, 1759, to Martha Dandridge, the widow of Col. Daniel Parke Custis. She had been born the same year as himself, was the mother of two children living and two dead, and possessed one of the largest fortunes on Virginia. Washington had met her the previous March, had been attracted by her brown hair, hazel eyes, and plump figure and had asked her hand before his campaign with Forbes. She had the qualities of a good housewife and companion, and the marriage was happy. But she no more represented his first love than he did hers; he had been rejected by a Miss Betsy Fauntleroy; tradition states that he had paid unsuccessful suit to Mary Philipse of New York, and there is clear evidence that he temporarily felt a romantic attachment for Sarah, the wife of his friend William Fairfax. The estimate of John Marshall that Washington's marriage brought him personally an increase of $75,000 in property, and of G. Washington Custis that it brought him $100,000, are excessive; a precise computation shows that the sum was about $66,000, then of course a handsome fortune. The holdings included about 15,000 ac., much of it valuable because placed near Williamsburg, a number of town lots, and 150 slaves, and from this time Washington added to the cares of Mount Vernon those of the Custis estate at the White House on the York river. From his marriage to the eve of the Revolution he devoted himself to the duties and pleasures of a great landowner, varied a few weeks every year by attendance as member of the house of burgesses. He was elected to this body in 1758, after standing treat to the voters a prodigious quantity of rum punch, wine, brandy, beer, and "cider royal."

A Virginia Planter.—In no light does Washington appear more characteristically than as one of the richest and largest of Virginia tobacco-planters. He was industrious, punctual, efficient, and economical. Disliking slavery on economic and social rather than moral grounds, he made the best of it, carefully clothed and fed his hands, and employed a doctor for the sick. He practised crop rotation, diversified his products to raise enough food for all his people and experimented in breeding horses and cattle. He had a peach and apple orchard, grafted many cherry, pear and plum trees, and grew Madeira grapes and the "Mississippi nut" or pecan. Till after the Revolution the Mount Vernon house was a small edifice of eight rooms, but he spent much pains on beautifying the grounds. The health, education and property of his stepchildren Patsy Custis and John Parke Custis were carefully supervised, Washington rendering minute yearly accounts to the court. He engaged a tutor, made special exertions to cure Patsy Custis of the epilepsy to which she succumbed in 1772, and sent John to King's college in New York for a few months. In the social life of Tidewater, Va., he played a prominent rôle. Mount Vernon was usually full of guests, casual travellers, invited friends and relatives. House-parties were frequent; Washington mentions many expenditures for arrack, wine and punch at neighbourhood clubs; he liked afternoon tea, served in summer on the Mount Vernon verandah; he was fond of picnics, barbecues, and clam-bakes; and throughout his life he enjoyed dancing, frequently going ten miles to Alexandria to attend balls. On the frontier he sighed in a letter for "assembly balls" and "routs," and at the age of 64 in 1796 he still danced. He went regularly to the Williamsburg races, where he sometimes ran horses of his own; and his account books frequently note sums lost at cards, the largest being £9 14s. In bad weather his diary sometimes states "at home all day, over cards." At billiards also he frequently won or lost small sums. At Mount Vernon riding to hounds was a favourite pastime, to which he devoted generous space in his diaries, while he took pains to improve the breed of his favourite hounds. In season he went gunning for ducks, and fished the Potomac for sturgeon and bass. He missed few opportunities to see plays at Alexandria or Williamsburg. He was able to quote

aptly from Shakespeare, Addison and Sterne.

Pre-Revolutionary Politics.—While Washington's associates marked him, in Col. John L. Peyton's words, as "a young man of an extraordinary and exalted character," he gave before 1770 no signs of greatness and few of interest in affairs of State. He played a silent part in the house of burgesses. But he was present when Patrick Henry introduced his resolutions against the Stamp Act in May, 1765, and shortly thereafter gave token of his adherence to the cause of the colonial Whigs against the Tory ministries of England. In 1768 he told George Mason at Mount Vernon that he would take his musket on his shoulder whenever his country called him. The next spring, April 4, 1769 he sent Mason the Philadelphia non-importation resolutions with a letter declaring that it was necessary to resist the strokes of "our lordly masters" in England, that courteous remonstrances to parliament having failed, he wholly endorsed the resort to commercial warfare, and that as a last resort, no man should scruple to use arms in defence of liberty. When, the following May, the royal governor dissolved the house of burgesses, he shared in the gathering at the Raleigh tavern which drew up non-importation resolutions, and he went farther than most of his neighbours in adhering to them. At this time and later he believed with most Americans that peace need not be broken. He had been interested since youth in Western lands, and in 1767 had asked Capt. William Crawford to find for him a fertile tract in western Pennsylvania. Late in 1770 he himself paid a land-hunting visit to Ft. Pitt, where George Croghan was maturing his plans for the proposed 14th colony of Vandalia. Washington directed his agent to locate and survey 10,000 ac. adjoining the Vandalia tract, and at one time he wished to share in certain of Croghan's schemes. But the Boston Tea-party of Dec. 1773, and the bursting at about the same time of the Vandalia bubble, turned his eyes back to the East and the threatening state of Anglo-American relations. He was not a member of the Virginia committee of correspondence formed in 1773 to communicate with other colonies, and when the Virginia legislators, meeting irregularly again at the Raleigh tavern in May, 1774, called for a Continental Congress, he does not seem to have been present. But he was a leading member of the first provincial convention or revolutionary legislature late that summer, and to this body he made a speech which was much praised for its pithy eloquence, declaring that "I will raise one thousand men, subsist them at my own expense, and march myself at their head for the relief of Boston."

The Virginia provincial convention promptly elected Washington one of the seven delegates to the first Continental Congress. He was by this time known as a radical rather than a moderate, and in several letters of the time he opposed a continuance of petitions to the British Crown, declaring that they would inevitably meet with a humiliating rejection. "Shall we after this whine and cry for relief when we have already tried it in vain?" he wrote. When the congress met in Philadelphia on Sept. 5, 1774, he was in his seat in full uniform; and his participation in its councils marks the beginning of his national career. Later Patrick Henry, being asked who was the greatest man in Congress, replied: "If you speak of eloquence, Mr. Rutledge of South Carolina is by far the greatest orator; but if you speak of solid information and sound judgment, Colonel Washington is unquestionably the greatest man on that floor." His letters of the period show that while still utterly opposed to the idea of independence, he was determined never to submit "to the loss of those valuable rights and privileges, which are essential to the happiness of every free State, and without which life, liberty, and property are rendered totally insecure." If the ministry pushed matters to an extremity, he wrote, "more blood will be spilled on this occasion than ever before in American history." Though he served on none of the committees, he was a useful member, his advice being sought on military matters, and weight being attached to his advocacy of a non-exportation as well as non-importation agreement. He also helped to secure congressional approval of the "Suffolk resolves," which looked toward armed resistance as a last resort, and which did much to harden the king's heart against America. Returning to Virginia in November, he took command of the volunteer companies now drilling there, and also served as chairman of the committee of safety in Fairfax county. The unanimity with which the Virginia troops turned to him, though the province contained many experienced officers and Col. William Byrd of Westover had succeeded Washington as commander-in-chief, was a tribute to his reputation and personality; it was understood that Virginia expected him to be her general.

Head of the Colonial Forces.—Washington's choice as commander-in-chief of the military forces of all the colonies followed immediately upon the first fighting, though it was by no means inevitable and was the product of partly artificial forces. The Virginia delegates differed upon his appointment. Washington himself recommended General Andrew Lewis for the place, and Edmund Pendleton was, according to John Adams, "very full and clear against it." It was chiefly the fruit of a political bargain by which New England offered Virginia the chief command as her price for the adoption and support of the New England army. This army had gathered hastily and in force about Boston immediately after the clash of British troops and American minutemen at Lexington and Concord on April 19, 1775. When the second Continental Congress met in Philadelphia on May 10, one of its first tasks was to find a permanent leadership for this force. On June 15 Washington, whose military counsel had already proved invaluable on two committees, was nominated by John Adams, and chosen by unanimous vote. Beyond the considerations noted, he owed his choice to the fact that Virginia stood with Massachusetts as one of the two most powerful colonies; that his appointment would augment the zeal of the Southern people; that he had made an enduring reputation in the Braddock campaign; and that his poise, sense and resolution had impressed all the delegates. The scene of his election, with Washington darting modestly into an adjoining room and John Hancock flushing with jealous mortification, will always impress the historical imagination. So also will the scene of July 3, 1775, when wheeling his horse under an elm in front of the troops paraded on Cambridge common he drew his sword and took command of the army investing Boston. News of Bunker Hill had reached him before he was a day's journey from Philadelphia, and he had expressed confidence of victory when told how the militia had fought. In accepting the command he refused any payment beyond his expenses, and called upon "every gentleman in the room" to bear witness that he disclaimed fitness for it. At once he showed characteristic decision and energy in organizing the raw volunteers, collecting provisions and munitions, and rallying Congress and the colonies to his support.

The first phase of Washington's command covered the period from July, 1775, to the British evacuation of Boston in March 1776. In these eight months he imparted discipline to the army, which at maximum strength slightly exceeded 20,000; he dealt with subordinates who as John Adams says quarrelled "like cats and dogs"; and kept the siege vigorously alive. Having himself planned an invasion of Canada by Lake Champlain, to be entrusted to General Philip Schuyler, he heartily approved of Benedict Arnold's proposal to march north along the Kennebec river and take Montreal and Quebec. Giving Arnold 1,100 men, he instructed him to do everything possible to conciliate the Canadians. He was equally active in encouraging privateers to attack British commerce. As fast as means offered, he strengthened his army with ammunition and siege-guns, bringing heavy artillery from Ticonderoga over the frozen roads early in 1776. His position was at first precarious, for the Charles river pierced the centre of his lines investing the town, and if Howe had moved his 20 veteran regiments boldly up the stream he might have pierced Washington's army and rolled either wing back to destruction. But all the generalship was on Washington's side. Seeing that Dorchester heights, just south of Boston, commanded the city and harbour, and that Howe had unaccountably failed to occupy it, he seized it on the night of March 4, 1776, placing his Ticonderoga guns in position. The British naval commander declared that he could not remain if the Americans were not dislodged, and Howe, after a storm disrupted his plans for an assault, evacuated the city on March 17. He left 200 cannon and invaluable stores

of small arms and munitions. After stamping out the smallpox in Boston and collecting his booty, Washington hurried south by land to take up the defence of New York.

Sources of Military Strength.—Washington had won the first round, but there remained five years of war, during which the American cause was repeatedly near complete disaster. It is unquestionable that Washington's strength of character, his ability to hold the confidence of army and people and to diffuse his own courage among them, his unremitting activity and his strong common sense, constituted the chief factor in achieving American victory. He was not a great tactician; as Jefferson said later, he often "failed in the field," he was sometimes guilty of grave military blunders, the chief being his assumption of a position on Long Island in 1776 which exposed his army to capture entire the moment it was defeated. At the outset he was painfully inexperienced, the wilderness fighting of the French war having done nothing to teach him the strategy of considerable armies. One of his chief faults was his tendency to subordinate his own judgment to that of the generals surrounding him; at every critical juncture, before Boston, before New York, before Philadelphia, in New Jersey, he called a council of war, and in almost every instance accepted its decision. Naturally bold and dashing, as he proved at Trenton, Princeton and Germantown, he repeatedly adopted evasive and delaying tactics on the advice of his associates; however he did succeed in keeping a strong army in existence and maintaining the flame of national spirit, and when the auspicious moment arrived, he planned the rapid movements which ended the war.

One element of Washington's strength was his sternness as a disciplinarian. The army was continually dwindling and refilling; politics largely governed the selection of officers by Congress and the States; and the ill-fed, ill-clothed, ill-paid forces were often half prostrated by sickness and ripe for mutiny. Troops from each of the three sections, New England, the Middle States and the South, showed a deplorable jealousy of the others. Washington was rigorous in breaking cowardly, inefficient and dishonest men, and boasted in front of Boston that he had "made a pretty good sort of slam among such kind of officers." Deserters and plunderers were flogged, and he once erected a gallows 40 ft. high, writing that "I am determined if I can be justified in the proceeding, to hang two or three on it, as an example to others." At the same time the commander-in-chief won the devotion of many of his men by his earnestness in demanding better treatment for them from Congress. He complained of their short rations, declaring once that they were forced to "eat every kind of horse food but hay."

Campaigns in Middle Colonies.—The darkest chapter in Washington's military leadership was opened when, reaching New York on April 23, 1776, he placed half his army, some 9,000 men, under Isaac Putnam, on the perilous position of Brooklyn heights, Long Island, where a British fleet in the East river might cut off their retreat. He spent a fortnight in May with the continental congress in Philadelphia, then discussing the question of independence; and though no record of his utterances exists, there can be no doubt that he advocated complete separation. His return to New York preceded but slightly the arrival of the British army under Howe, which made its main encampment on Staten Island till its whole strength of nearly 30,000 could be mobilized. On Aug. 22, 1776, Howe moved about 20,000 men across to Gravesend bay on Long Island. Four days later, sending the fleet under command of his brother Lord Howe to make a feint against New York city, he thrust a crushing force along feebly protected roads against the American flank. The patriots were out-manoeuvred, defeated, and suffered a total loss of 5,000, of whom 2,000 were captured. Their whole position might have been carried by storm, but fortunately for Washington, Howe delayed. While the enemy lingered, he succeeded under cover of a dense fog in ferrying the remaining force across the East river to Manhattan, where he took up a fortified position. The British, suddenly landing on the lower part of the island, drove back the Americans in a clash marked by disgraceful cowardice on the part of Connecticut and other troops. In a series of actions Washington was forced northward, more than once in danger of capture, till the loss of his two Hudson river forts, one of them with 2,600 men, compelled him to retreat from White Plains across the river into New Jersey. Here he slowly retired toward the Delaware, and as he went his army melted away, till it seemed that armed resistance to the British was about to expire.

It was at this darkest hour of the Revolution that Washington struck his brilliant blows at Trenton and Princeton, reviving the hopes and energies of the nation. Howe, believing the American army would soon totally dissolve, retired to New York, leaving strong forces in Trenton and Burlington. Washington at his camp west of the Delaware planned a simultaneous attack on both posts, using his whole command of 6,000 men. But his subordinates in charge of both wings failed him, and he was left on the night of Christmas day, 1776, to march on Trenton alone with some 2,400 men. He completely surprised the unprepared Hessians, and after confused street fighting killed the commander, Rahl, and captured 1,000 prisoners, with arms and ammunition. The immediate result was that General Cornwallis hastened with 8,000 men to Trenton, where he found Washington strongly posted behind the Assumpink river, skirmished with him, and decided to wait overnight "to bag the old fox." During the night the wind shifted, the roads froze hard, and Washington was enabled to steal away from camp, leaving his fires deceptively burning, march around Cornwallis's rear, and fall at daybreak upon the three British regiments at Princeton. These were put to flight with a loss of 500 men, and Washington escaped with more captured munitions to a strong position at Morristown, N.J. The effect of these victories was threefold; they heartened all Americans, brought recruits flocking to camp with the spring, and encouraged foreign sympathizers with the American cause.

Valley Forge.—Thus far the important successes had been won by Washington; now they fell to others, while he was left to face popular apathy, military cabals, and the disaffection of Congress. The year 1777 was marked by the British capture of Philadelphia and the surrender of Burgoyne's invading army to Gates at Saratoga, followed by intrigues to displace Washington from his command. Howe's main British army of 18,000 left New York by sea on July 23, 1777, and landed on Aug. 25 in Delaware not far below Philadelphia. Washington, despite his inferiority of force, for he had only 11,000 men, mostly militia and in Lafayette's words "badly armed and worse clothed," risked a pitched battle on Sept. 11 at the fords of Brandywine creek, about 13 m. north of Wilmington. While part of the British force held the Americans engaged, Cornwallis with the rest made a secret 17 m. detour and fell with crushing effect on the American right and rear, the result being a complete defeat, from which Washington was fortunate to extricate his army in fairly good order. For a time he hoped to hold the Schuylkill fords, but the British passed them and on Sept. 26 triumphantly marched into Philadelphia. Congress fled to the interior of Pennsylvania, and Washington, after an unsuccessful effort to repeat his stroke at Trenton against the British troops posted at Germantown, had to take up winter quarters at Valley Forge. His army, twice-beaten, ill-housed, and ill-fed, with thousands of men "barefoot and otherwise naked," was at the point of exhaustion; it could not keep the field, for inside of a month it would have disappeared. Under these circumstances, there is nothing which better proves the true fibre of Washington's character and the courage of his soul than the unyielding persistence with which he held his strong position at Valley Forge through a winter of semi-starvation, of justified grumbling by his men, of harsh public criticism, and of captious meddling by a Congress too weak to help him.

Intrigues.—Washington's enemies seized the moment of his greatest weakness to give vent to an antagonism which had been nourished by sectional jealousies of North against South, by the ambition of small rivals, and by baseless accusations that he showed favouritism to such foreigners as Lafayette. The intrigues of Thomas Conway, an Irish adventurer who had served in the French army and had become American inspector-general, enlisted Thomas Mifflin, Charles Lee, Benjamin Rush and others in an attempt to displace Washington. Gen. Horatio Gates appears to

have been a tool of rather than a party to the plot, expecting that the chief command would devolve upon himself. A faction of Congress sympathized with the movement and attempted to paralyze Washington by reorganizing the board of war, a body vested with the general superintendence of operations, of which Gates became president, his chief-of-staff, James Wilkinson, the secretary, and Mifflin and Timothy Pickering members. Washington was well aware of the hostility in Congress, of the slanders spread by Dr. Rush and James Lovell of Massachusetts, and of the effect of forgeries published in the American press by adroit British agents. He realized the intense jealousy of many New Englanders, which made even John Adams write his wife that he was thankful Burgoyne had not been captured by Washington, who would then "have been deified. It is bad enough as it is." But Washington decisively crushed the cabal when, the loose tongue of Wilkinson having disclosed Conway's treachery, he sent the latter officer on Nov. 9, 1777, proof of his knowledge of the whole affair.

With the conclusion of the French alliance in the spring of 1778 the aspect of the war was radically altered; and the British army in Philadelphia, fearing that a French fleet would blockade the Delaware while the militia of New Jersey and Pennsylvania invested the city, hastily retreated upon New York city. Washington hoped to cut off part of the enemy, and by a hurried march with six brigades interposed himself at the end of June between Sir Henry Clinton (who had succeeded Howe) and the Jersey coast. The result was the battle of Monmouth on June 28, where a shrewd strategic plan and vigorous assault were brought to naught by the treachery of Charles Lee. When Lee ruined the attack by a sudden order to retreat, Washington hurried forward, fiercely denounced him, and restored the line, but the golden opportunity had been lost. The British made good their march to Sandy Hook and Washington took up his quarters at New Brunswick. Lee was arrested, court-martialed and convicted on all three of the charges made against him; but instead of being shot, as he deserved, he was sentenced to a suspension from command for one year. The arrival of the French fleet under D'Estaing in July, 1778, completed the isolation of the British and Clinton was thenceforth held to New York city and the surrounding area; Washington making his headquarters in the highlands of the Hudson, and distributing his troops in cantonments around the city and in New Jersey.

Yorktown.—To Washington's vision the final decisive stroke of the war, the capture of Cornwallis at Yorktown, is chiefly to be credited. With the domestic situation intensely gloomy early in 1781, he was hampered by the feebleness of Congress, the popular discouragement, and inability to rely upon prompt and strong support by the French fleet. A French army under Rochambeau having arrived to reinforce him in 1780, he pressed De Grasse to assist in an attack upon either Cornwallis at the South or Clinton in New York. In August the French admiral sent definite word that he preferred the Chesapeake, with its large area and deep water, as the scene of his operations; and within a week, on Aug. 19, 1781, Washington marched south with his army, leaving Heath with 4,000 men to hold West Point. He hurried his troops through New Jersey, embarked them on transports in Delaware bay, and landed them at Williamsburg, Va., where he had himself arrived on Sept. 14. Cornwallis had retreated to Yorktown and entrenched his army of 7,000 British regulars. Their works were completely invested before the end of the month; the siege was pressed with vigour by the allied armies under Washington, consisting of 5,500 Continentals, 3,500 Virginia militia, and 5,000 French regulars; and on Oct. 21, Cornwallis surrendered. By this campaign, probably the finest single display of Washington's generalship, the war was brought to a virtual close.

Washington remained during the winter of 1781–82 with the Continental Congress in Philadelphia, exhorting it to maintain its exertions for liberty and to settle the claims of the army and officers; exhortations which he continued after he joined his command at Newburgh on the Hudson in April, 1782. Suggestions at this time that he found a monarchy were brusquely repelled. When the discontent of his unpaid men came to a head in the circulation of the "Newburgh address" early in 1783, he issued a general order censuring the paper, and at a meeting of officers on March 15 read a speech admonishing the army to obey Congress and promising his best efforts for a redress of grievances. He was present at the entrance of the American army into New York on the day of Clinton's evacuation, Nov. 25, 1783, and on Dec. 4 took leave of his closest officers in an affecting scene at Fraunces' tavern. Travelling south, on Dec. 23, in a solemn ceremonial immortalized by the pen of Thackeray, he resigned his commission to the Continental Congress in the State senate chamber of Maryland in Annapolis, and received the thanks of the nation. His accounts of personal expenditures during his service, kept with minute exactness in his own handwriting, and totalling £14,500, without charge for salary, had been given the controller of the Treasury to be discharged. Leaving Annapolis at sunrise of Dec. 24, before nightfall he was at home in Mount Vernon.

In the next four years Washington found sufficient occupation in his estates, wishing to close his days as a gentleman-farmer and giving to agriculture as much energy and thought as to the army. He enlarged the Mount Vernon house in 1786; he laid out the grounds anew, with sunken walls or ha-has; and he embarked on experiments with mahogany, palmetto, pepper, and other foreign trees, English grasses, and grains. His farm manager during the Revolution, a distant relative named Lund Washington, retired in 1785, and was succeeded by a nephew, Maj. George Augustine Washington, who resided at Mount Vernon till his death in 1792. Washington's losses during the war had been heavy, partly through neglect of his lands, partly through stoppage of exportation, and partly through a depreciation of paper money which cost him hardly less than $30,000. He now successfully attempted to repair his fortunes, his annual receipts from all his estates being from $10,000 to $15,000 a year. In 1784 he made a tour of nearly 700 miles to view the wild lands he owned to the westward, Congress having made him a generous grant. As a national figure, he was constrained to offer hospitality to old army friends, visitors from other States and nations, diplomats, and Indian delegations, and he and his household seldom sat down to dinner alone.

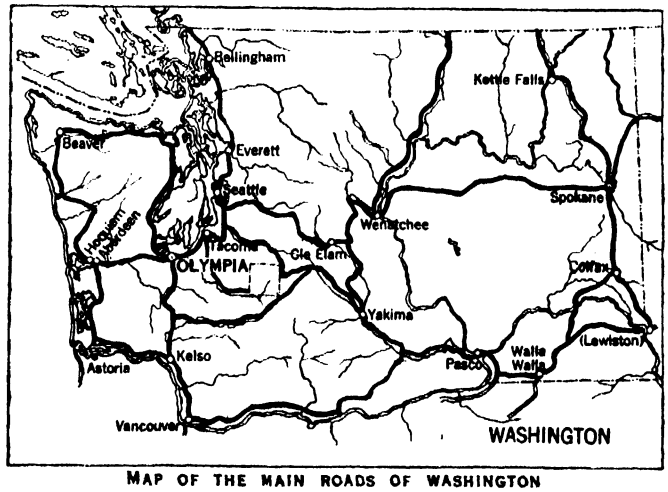
A More Perfect Union.—Viewing the chaotic political condition of the United States after 1783 with frank pessimism, and declaring (May 18, 1786) that "something must be done, or the fabric must fall, for it is certainly tottering," Washington repeatedly wrote his friends urging steps toward "an indissoluble union." At first he believed that the Articles of Confederation might be amended. Later, especially after the shock of Shays's Rebellion, he took the view that a more radical reform was necessary, but doubted as late as the end of 1786 that the time was ripe. He earnestly supported the proposal for a Federal impost, warning the States that their policy must decide "whether the Revolution must ultimately be considered a blessing or a curse." His numerous letters to the leading men of the country assisted greatly to form a sentiment favourable to a more perfect union. Some understanding being necessary between Virginia and Maryland regarding the navigation of the Potomac, commissioners from the two States met at Mount Vernon in the spring of 1785; and from this seed sprang the Federal Convention. Washington approved in advance the call for a gathering of all the States to meet in Philadelphia in May, 1787, to "render the Constitution of the Federal Government adequate to the exigencies of the Union." Though he hoped to be excused, he was chosen one of Virginia's five delegates, arrived in Philadelphia on May 13, the day before its opening, and as soon as a quorum was obtained, was unanimously chosen its president. For four months Washington presided over the Constitutional Convention, breaking his silence only once upon a minor question of Congressional apportionment. But though he said little in debate no one did more outside the hall to insist on stern measures. "My wish is," he wrote, "that the convention may adopt no temporizing expedients, but probe the defects of the Constitution to the bottom, and provide a radical cure." His weight of character did more than any other single force to bring the convention to an agreement and obtain ratification of the instrument afterward. He did not believe it perfect, though his precise criticisms of it are unknown. But his support

gave it victory in Virginia, where he sent copies to Patrick Henry and other leaders with a hint that the alternative to adoption was anarchy; while a letter of his published in a Boston newspaper, declaring that "it or dis-union is before us to chuse from," told powerfully in Massachusetts. He received and personally circulated copies of the *Federalist*. When once ratification was obtained, he wrote leaders in the various States urging that men staunchly favourable to it be elected to Congress. For a time he sincerely believed that, the new framework completed, he would be allowed to retire again to privacy. But all eyes immediately turned to him for the first president. He alone commanded the respect of both the parties engendered by the struggle over ratification, and he alone would be able to give prestige to the republic throughout Europe. In no State was any other name considered. The electors chosen in the first days of 1789 cast a unanimous vote for him, and reluctantly—for his love of peace, his distrust of his own abilities, and his fear that his motives in advocating the new government might be misconstrued all made him unwilling—he accepted. On April 16, after receiving congressional notification of the honour, he set out from Mount Vernon, reaching New York in time to be inaugurated on April 30. This ceremony was performed in Wall Street, near the spot now marked by Ward's statue of Washington, and in the presence of a great crowd which broke into cheers as, standing on the balcony of Federal Hall, he took the oath administered by Chancellor Livingston, and retired indoors to read Congress his inaugural.

President of the United States.—Washington's administration of the government in the next eight years was marked by the caution, the methodical precision and the sober judgment which had always characterized him. He regarded himself as standing aloof from party divisions, and emphasized his position as president of the whole country by a tour first through the Northern States and later through the Southern. A painstaking inquiry into all the problems confronting the new nation laid the basis for a series of judicious recommendations to Congress in his first message. In selecting the four members of his first cabinet, Thomas Jefferson as secretary of State, Alexander Hamilton as secretary of Treasury, Henry Knox as secretary of War and Edmund Randolph as attorney-general, Washington balanced the two parties evenly. But he leaned with especial weight upon Hamilton, supporting his scheme for the assumption of State debts, taking his view that the bill establishing the United States Bank was constitutional and in general strengthening the authority of the Federal Government. Distressed when the inevitable clash between Jefferson and Hamilton arose, he tried to keep harmony, writing frankly to each and refusing to accept their resignations. But when war was declared between France and England in 1793, he again took Hamilton's view that the United States should completely disregard the treaty of alliance with France and pursue a course of strict neutrality, while he acted decisively to stop the improper operations of the French Minister, Genêt. The sequel was the resignation of Jefferson at the close of 1793, the two men parting on good terms and Washington praising Jefferson's "integrity and talents." The suppression of the Whiskey Rebellion in 1794, by Federal troops whom Hamilton led in person, and the despatch of John Jay to conclude a treaty of commerce with Great Britain, tended further to align Washington with the Federalist party. Though the general voice of the people compelled him to acquiesce reluctantly in a second term in 1792, and his election that year was again unanimous, during his last four years in office he suffered from a fierce personal and partisan animosity. This culminated when the publication of the terms of Jay's treaty, which Washington signed on Aug. 18, 1795, provoked a bitter discussion, and the House of Representatives called upon the president for the instructions and correspondence relating to the treaty. These Washington, who had already clashed with the Senate on foreign affairs, refused to deliver, and in the face of an acrimonious debate firmly maintained his position.

Early in his first term Washington, who by education and natural inclination was minutely careful of the proprieties of life, established the rules of a virtual republican court. In both New York and Philadelphia he rented the best houses procurable, refusing to accept the hospitality of George Clinton, for he believed the head of the nation should be no man's guest. He returned no calls and shook hands with no one, acknowledging salutations by a formal bow. He drove in a coach with four or six smart horses, and outriders and lackeys in rich livery. At receptions he came in a black velvet suit with gold buckles, yellow gloves, powdered hair, a cocked hat with an ostrich plume in one hand, and a sword in a white leather scabbard. After being overpowered by callers, he announced that except for a weekly levee open to all, persons desiring to see him must make previous engagements. On Friday afternoons Mrs. Washington held more informal receptions, at which the president appeared and chatted gravely with both ladies and gentlemen. Though the presidents of the Continental Congress had made their tables partly public, Washington, who entertained largely, taking members of Congress in rotation, insisted that his hospitality be entirely private. He served good wines and the menus were elaborate, but such visitors as Senator Maclay complained that the atmosphere was too "solemn." Indeed, his simple ceremony offended many of the more radical anti-federalists, who did not share his sense of its fitness and accused the president of conducting himself like a king. But his cold and reserved manner was due rather to native diffidence than to any excessive sense of dignity.

Retirement.—Earnestly desiring leisure, feeling a decline of his physical powers, and wincing under opposition abuse, Washington refused to yield to the general pressure for a third term. This refusal was blended with a testament of sagacious advice to his country in the *Farewell Address* of Sept. 19, 1796, written largely by Hamilton but remoulded by Washington and expressing his ideas. Retiring in March, 1797, to Mount Vernon, he devoted himself for the last two and a half years of his life to his family, farm operations and care of his slaves. In 1798 his seclusion was briefly threatened when the prospect of war with France caused his appointment as commander-in-chief of the provisional army, and he was much worried by the political quarrels over high commissions; but the war cloud passed away. On Dec. 12, 1799, he exposed himself on horseback for several hours to cold and snow, and returning home exhausted, was attacked late next day with quinsy or acute laryngitis. He was bled heavily four times, given gargles of "molasses, vinegar and butter," and a blister of cantharides was placed on his throat, his strength meanwhile rapidly sinking. The best modern treatment would probably have been unavailing. He faced the end with characteristic serenity, saying "I die hard, but I am not afraid to go," and later: "I feel myself going. I thank you for your attentions; but I pray you to take no more trouble about me. Let me go off quietly. I cannot last long." After giving instructions to his secretary, Tobias Lear, about his burial, he died at 10 P.M. on Dec. 14 without pain or struggle. The news of his death placed the entire United States in mourning, and the sentiment of the country permanently endorsed the famous words of Henry Lee, embodied in resolutions which John Marshall introduced in the House of Representatives, that he was "first in war, first in peace, and first in the hearts of his countrymen." When the intelligence reached Europe the British channel fleet and the armies of Napoleon paid tribute to his memory; and many of the political and intellectual leaders of the time joined in according him a preeminent place among the heroes of history.



BIBLIOGRAPHY.—The earliest known portrait of Washington is that by Charles Wilson Peale, painted in 1772. A long line of painters and sculptors followed, and their work may be found criticized in Justin Winsor's *Narrative and Critical History of America, vol. VII.* Washington himself thought highly of the likeness by Joseph Wright, painted in 1782. According to Winsor, the favourite profile is Houdon's, while Gilbert Stuart's canvas had been popularly preferred for the full face, and John Trumbull's florid paintings for the whole figure. Stuart's pictures are somewhat idealized, while all the later portraits suffer from the fact that the artificial teeth worn by Washington in later years altered the expression of his face. Houdon's statue hardly does justice to Washington's imposing stature; he was 6 ft. 3 in. tall in his prime, and weighed 220 lb., carrying himself with great dignity and poise.

A full collection of books upon Washington would fill a large library, and the list is being steadily extended. The best edition of his writings is that edited by Worthington C. Ford (1889–93); superseding that by Jared Sparks (1837), the latter contains some papers not found else-

where. Nearly all of the Presidential messages and proclamations are to be found in J. D. Richardson's *Messages and Papers of the Presidents* (1896). The best of the earlier biographies are those by John Marshall (1804–07); Washington Irving (1855–59); Edward Everett Hale (1888); Henry Cabot Lodge (1889); Woodrow Wilson (1897); Worthington C. Ford (1899); and Norman Hapgood (1901). These were supplemented in their time by such special works as G. W. P. Custis, *Recollections and Private Memoirs of Washington* (1860); R. Rush, *Washington in Domestic Life* (1857); H. B. Carrington, *Washington the Soldier* (1899); Paul Leicester Ford, *The True George Washington* (1896); B. T. Johnston, *General Washington* (1894). But in recent years large additions have been made to the store of knowledge of Washington and his times by John C. Fitzpatrick, *The Diaries of George Washington, 1748–1799* (1925); Paul Leland Haworth, *George Washington, Farmer* (1915); Eugene E. Prussing, *The Estate of George Washington* (1927); Charles Moore, *The Family Life of George Washington* (1926); and Archer B. Hulbert, *Washington and the West* (1911). An iconoclastic short life, often inaccurate, has been written by W. E. Woodward, *George Washington: The Image and the Man* (1926) and a detailed and scholarly record, deficient in literary quality, by Rupert Hughes in *George Washington the Human Being and the Hero, 1732–1762,* and *George Washington the Rebel and the Patriot, 1762–1777* (1926, 1927). For a treatment of the military and political background of his times the student must go to George Otto Trevelyan's history of the American Revolution, to the large histories by Bancroft, Winsor, McMaster, Schouler, and Channing, to *William Maclay's Journal,* 1789–91 (1890), and to such books as Henry Jones Ford's *Washington and his Colleagues* (1918). The best work on Martha Washington remains Anne Hollingsworth Wharton's *Martha Washington* (1897). (A. N.)

WASHINGTON, the "Evergreen State," is the most north-westerly State of the United States of America. Its extreme length east and west is 360 m., its extreme width north and south is 240 m. and its total area is 69,127 sq.m., of which 2,291 sq.m. is water surface. It was first intended to call the State Columbia, but from fear that confusion with the District of Columbia would result, that name was amended in the bill.

Physical Features.—The Cascade Mountain range running north from the Columbia river to the Canadian border divide the State into sections commonly known as eastern Washington and western Washington. The hurrying cascades that have carved deep valleys between the high serrated summits have given the range its name. From a width of 100 m. at the northern border, it narrows to about 50 m. where the Columbia river has carved its canyon on its way to the ocean. The summits average about 8,000 ft. in altitude, while few passes less than 6,000 ft. can be found through the chain. Far above the average summits a number of extinct volcanoes rear their glacier-covered sides, chief among them being Mt. Rainier (14,408 ft.), Mt. Adams (12,307 ft.), Mt. Baker (10,730 ft.), Glacier Peak (10,436 ft.), Mt. St. Helens (9,697 ft.), and Mt. Stuart (9,470 ft.). The forests of the Cascades, especially on the western slopes, seem almost to attain as magnificent gestures as the peaks themselves, for cedars, Douglas fir and Douglas spruce often reach 200 ft. in height. The forests in season are painted by the pink petals of the rhododendron, the State flower.

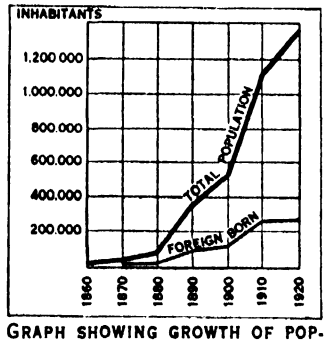
MAP OF THE MAIN ROADS OF WASHINGTON

To the east of the Cascades and bounded on the north by the Okanogan highlands lie the Columbia river plains, a region fast gaining fame as the "Inland Empire," with Spokane as its capital. The plains range in altitude from 500 to slightly over 2,000 ft. with a gentle slope toward the river. Besides the river valleys, some depressions known as "coulees" and some low hills alternate with vast level stretches or undulating country. The soil is mainly a decomposed basalt known as volcanic ash, rich in mineral food elements, and if nitrogen can be worked into it, exceedingly fertile under irrigation. The red-cheeked apples of the Wenatchee have become famous in all the fruit markets of America. The Walla Walla is also a well known grain and fruit raising valley. The centre portion of these plains, known as the Great Bend region, is the driest part of Washington, containing a number of lost rivers and alkaline lakes of which Soap lake, a health resort, and Moses lake are best known. A number of these lakes occupy the bed of the Grand Coulee, a depression from 500 to 1,000 ft. deep, extending for many miles and supposed to be the old bed of the Columbia river. Toward the south-east the plains are interrupted by an extension from Oregon of the Blue mountains, rising over 7,000 feet. To the north, lie the Okanogan highlands, a region of gentler slopes with pine timber and fertile valleys.

West of the Cascades lies the Puget sound basin, and between the basin and the ocean rises another chain of mountains known as the Coast range. This range increases in height and ruggedness toward the north-west, forming the Olympic mountains, a group of wild beauty rising almost immediately from the sea, dominating the whole Olympic peninsula, and culminating in Mt. Olympus, 7,915 ft. in altitude. For nearly the entire year the summits are snow-capped, and seen from Seattle or Tacoma across the sound they form a refreshing and inspiring panorama. Trails and roads are making the region more accessible, and it is saved for purposes of public recreation by being enclosed in the Olympic National forest of 1,460,665 ac., the heart of which is set aside as Mt. Olympus National Monument.

The Puget sound basin slopes northward gradually from the height of land which divides it from the valley of the Cowlitz river, a tributary of the Columbia. In the north end of the basin the water has conquered and forms Puget sound itself, which is connected with the Pacific by the Strait of Juan de Fuca. Around the shores of the sound are five of Washington's most populous counties, and four of the five largest cities. Branching from the sound and lying close to the steep slopes of the Olympics, is the Hood canal, a narrow fjord penetrating about 60 m. inland to the south-west, and then bending back upon the Kitsap peninsula. The sound itself is made more interesting by its many islands, large and small. Whidby, the largest, extends about 50 m. N. and S., and together with several lesser islands forms Island county. The other identations are Grays Harbor and Willapa bay, both famous fishing and lumbering centres.

In no part of the generally inhabited regions of Washington are there wide extremes of temperature. The summers are usually cool and the winters mild. This equability is probably caused partly by the warm Japan current, and partly by protection afforded by the mountains. The climate of eastern Washington is considerably drier than that west of the Cascades. The precipitation in the Puget sound district is about the same as that in Chicago, 30–50 in. annually. Irrigation is unnecessary west of the mountains. Little snow falls in the valleys, and a greater part of the rainfall comes in the winter months.



Government.—Washington is governed under its original Constitution, adopted on Oct. 1, 1889, and since frequently amended. Except for the powers of initiative and referendum which the people possess by virtue of a constitutional amendment in 1912, the legislative authority of the State is vested in the legislature, consisting of a senate and a house of representatives. Its regular meetings occur in January of odd-numbered years at Olympia, the capital, and are limited by the Constitution to 60 days. Special meetings may be called by the governor at his discretion. The senate in 1927 numbered 42 members, each elected for four years (half of the senatorial body retires every two years), and the house of representatives numbered 96 members, elected for two years each. Washington also elects two senators and five representatives (1927) to represent it in congress.

The State legislature is limited in three ways: (1) by the Constitution, containing a list of 18 cases in which it is forbidden to enact legislation; (2) by the governor, whose veto of any bill must be overridden by a two-thirds majority in both houses, or the bill dies; and (3) by the people, who have the powers of initiative, referendum and recall. Petitions containing a printed copy of the proposed measure and signed by 10% of all the voters must be filed before any initiated measure can be presented at a general election to be voted upon. To secure a referendum, petitions need contain the signature of but 6% of the voters. Also the legislature itself can, if it wishes, refer any bill it has passed to the people for their approval. Any elective officer, with the exception of judges of county and State courts, is subject to recall.

The executive department consists of a governor, lieutenant governor, secretary of State, treasurer, auditor, attorney general, superintendent of public instruction and commissioner of public lands, all chosen for a term of four years. In 1921, the legislature passed an act known as the Administrative Code, which abolished some 70 boards and commissions, which had come into existence from time to time, and distributed their duties among ten new departments, namely those of public works, business control, efficiency, taxation and examination, health, conservation and development, labour and industry, agriculture, licences, fisheries and game. Each of these departments is in charge of a director appointed by the governor with the consent of the senate. Most departments are subdivided into divisions, each headed by a supervisor. The governor and the directors of the ten departments constitute the administrative board.

The judicial department is composed of the supreme court of the State, the superior courts for the counties and courts of justices of the peace for cities, towns or precincts. The last named deal with civil cases involving less than $100, and criminal cases below the rank of felony. While it is intended that ultimately each county shall have a superior court, some of those most sparsely settled are combined under one court and justice as yet. In densely populated counties the superior court is divided into departments with one justice for each. Thus King county has nine judges, Spokane county five, Pierce county four and several other counties two each. Justices of the superior courts are elected for four years. The jurisdiction of the supreme court is almost entirely appellate.

Population.—The population of Washington was 11,594 in 1860; 23,955 in 1870; 75,116 in 1880; 357,232 in 1890; 518,103 in 1900; 1,141,990 in 1910 and 1,356,621 in 1920. In 1927 it was estimated by the Federal Census Bureau at 1,562,000. The increase between 1900 and 1910 (120·4%) was greater than that of any other State in the United States. Between 1910 and 1920 the increase was but 18·8%. Fourteen of Washington's 39 counties registered a decrease, most of them being in the south-east where dry land farming had been attempted with failure in many instances. Fruit-raising counties registered a 25–75% increase. The density per square mile increased from 7·8 in 1900 to 17·1 in 1910 and to 20·3 in 1920. Of the 1,356,621 inhabitants in 1920, 748,735 or 55·2%, lived in cities of over 2,500 population. This showed a slight cityward trend since 1910, when 53% of the population was urban. Of the 607,886 rural inhabitants in 1920, 283,382 were living on farms. In 1925 the farm population was 288,673. Of the 748,735 urban population, 315,312 were in Seattle, the largest city, 104,437 in Spokane, the metropolis of eastern Washington, 96,965 in Tacoma, 27,644 in Everett and 25,585 in Bellingham. The 1926 estimates for these cities were approximately the same as the 1920 census figures. Aberdeen, Hoquiam, Vancouver, Walla Walla and Yakima were other cities over 10,000 in population. Olympia, the capital, has a population of 7,795.

GRAPH SHOWING GROWTH OF POPULATION WITH % OF FOREIGN BORN

Of the 1920 population 97·3% was white. Indians numbered 9,061 (10,997 in 1910), negroes 6,883 (6,058 in 1910), Chinese 2,360 (2,709 in 1910), Japanese 17,387 (12,929 in 1910). Of the white population in 1920 250,055 (18·9%) were foreign born, 214,618 (16·3%) born of foreign parentage, 143,398 (10·9%) born of mixed parentage and 711,706 (53·9%) born of native parentage. The origin of the foreign born was: Canada, 42,988; United Kingdom and Ireland, 39,659; Sweden, 34,793; Norway, 30,304; Germany, 22,315; Finland, 11,863; Russia, 11,124; and Italy 10,813. Other countries had less than 10,000 representatives.

Washington in 1924 had a birth rate of 17·4 per thousand population. There were 10 deaths per thousand population.

Finance.—The estimated value of all tangible property in the State was $5,122,000,000 in 1922. The assessed value, in 1925, of property subject to tax was $1,158,000,000. The net receipts of the State Government were $61,972,219 for the biennium 1924–26, and the net expenditure was $60,300,560. Of the receipts, $14,495,637 were derived from a direct property tax, and $49,885,218 from indirect sources of revenue. Compared with the biennium 1922–24 these amounts represent a decrease of $5,490,375 in the direct property tax and an increase of $9,669,834 in indirect revenue. The gross disbursements of 1924–26, $72,878,645, may be compared with $66,691,402 for 1922–24; $73,020,173 for 1920–22 and $42,953,824 for 1918–20. Receipts for the general fund in 1924–26 were $710,923 from the State property tax and $6,406,634 from indirect revenue sources. Together with the $5,143,766 balance on hand at the beginning of the biennium, this made a total of $12,261,321, of which sum $9,933,107 was disbursed, leaving $2,328,216 at the end of the biennium. The largest of the special funds was the motor vehicle fund, for which the receipts during the biennium were $19,687,650 and the expenditures $18,770,572. Of the receipts, licence fees furnished $5,176,286, fuel taxes $6,655,381, and a grant from the Federal Government, in aid of road projects, $2,330,036. The State university fund received $2,505,470 of its total of $3,206,892 from the direct property tax. Its expenditures were $2,755,570.

The only bonded indebtedness of the State was incurred for a soldiers' bonus. This debt was reduced in amount from $13,191,000 in 1922 to $10,600,000 in 1926, and provision for refunding the remainder when due has been made. The debt in 1925 averaged only $7.25 *per caput*. The debts of the local governments in Washington, however, are high, those of county governments amounting to $21,920,000, those of incorporated places, $84,901,000, and those of other civil divisions, $49,051,000.

In 1926 there were 250 State banks, 107 national banks, five trust companies and four mutual savings banks in the State. Their total resources amounted to $567,360,252, as compared with $426,321,184 in 1922. Their total deposits were $463,542,706, as compared with $294,094,515 in 1922, and of this $237,568,817 were savings deposits, as against $131,684,421 in 1922.

Education.—In 1926 the chief statistician of the United States Bureau of Education ranked Washington first among the States in educational standing according to a ten point scale used in the survey. The administration of the State's school system is under the control of a board of education, consisting of the superintendent of public instruction and seven other members, some ex-official and some appointed by the governor. The school census, including children between the ages of 4 and 20, was 414,373 in 1925, while the school enrolment was 329,288 or 79·36%. Attendance is compulsory between the ages 8 and 15. Of the total enrolment, 98% were enrolled in schools in session nine months or more. In 1926 21,115 pupils graduated from the eighth grade. Nine out of every ten of these entered a high school. Since 1912 the high school enrolment has seen an average annual increase of over 3,000 students, reaching in 1926 a total of 70,474 with a graduating class of 10,121. There were in 1926 259 high schools, and 14 private schools fully accredited. There were also 28 junior high or intermediate schools and the junior high school movement was gaining momentum. There were 352 consolidated schools in the State and 448 teachers' cottages. Washington has been a pioneer in the movement to build such private cottages for the teachers near to the school, thus eliminating the old "boarding

out" feature of rural and small town teaching. The total value of the 3,045 school buildings in the State in 1926 was estimated at $60,243,393, and the value of their equipment was $8,160,184. The school district libraries contained 893,360 reference books and 2,746,846 free text-books. There were in 1925–26 11,376 teachers employed at salaries aggregating $16,602,679. Of these 2,516 were high school teachers receiving average salaries for men of $1,873 and for women of $1,404. Grade teachers in village or city schools numbered 6,080 and received an average salary for men of $1,462, and for women of $1,371. Rural teachers numbered 1,371 and were receiving an average salary of $1,028 for men, and $994 for women. There were in addition 1,409 superintendents, principals and supervisors employed at an average salary for men of $2,171 and for women of $1,608.

The State-supported institutions of higher learning are the University of Washington at Seattle, the State College of Washington at Pullman and three State normals at Bellingham, Ellensburg and Cheney. The enrolment at the university was 7,260 for the regular term 1925–26, and in June, 1926, 988 degrees were granted. The State college enrolment was 3,385. Here are located both the engineering and agricultural schools, and connected with the latter are six experiment stations distributed over the State. In the Bellingham Normal there was an enrolment of 2,201 resident students in 1925–26, in the Ellensburg Normal, 1,022, and in the Cheney Normal, 1,802.

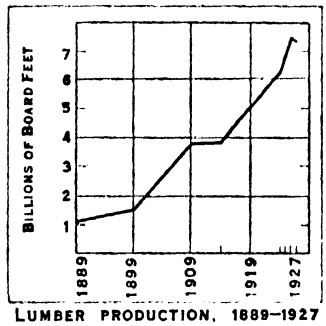
Penal and Charitable Institutions.—The Administrative Code of 1921 placed the administration of the various State charitable and penal institutions in the hands of the department of business control, headed by a director appointed by the governor. These institutions are the Western State hospital for the insane at Ft. Steilacoom, the Northern State hospital for the insane at Sedro Woolley, the Eastern State hospital for the insane at Medical Lake, the State Custodial school for the feeble-minded at Medical Lake, the State Soldiers' Home at Orting, the Veterans' Home at Retsil, the State Training school for boys at Chehalis, the State school for girls at Grand Mound, the State Reformatory at Monroe, the State school for the deaf and for the blind at Vancouver, and the State Penitentiary at Walla Walla.

Agriculture and Live Stock.—In 1925 the farm lands amounted to 12,608,000 ac. (29·5% of the area of the State), of which 6,084,000 ac. was considered crop land. In 1924 3,263,000 ac. were harvested. The remainder was classified mainly as pasture and woodland. The value of farm property increased from $637,543,000 in 1910 to $1,057,430,000 in 1920. From 1920 to 1925 it decreased, however, owing to the general depression after the World War. Farm lands valued at $797,651,000 in 1920 were worth only $584,386,000 in 1925, while the average value per farm decreased from $13,885, to $9,921. Washington, though, did not feel the depression as heavily as did her sister agricultural States in the West. The value of buildings on the farms, for instance, increased from $122,741,000 in 1920 to $142,504,000 in 1925. The number of farms increased from 66,288 to 73,267 in the same years, and the farm population increased from 283,000 to 288,673. In farm population Washington was one of the three States in the United States, outside of New England, showing an increase.

One reason, doubtless, for the comparatively good showing made by the State during the period of depression is its great diversification in agricultural products. It is strong, not only in the grains, but also in vegetables and fruits. From 1924–26 the value of crops rose from $130,587,000 to $147,220,000. The acreage of the 22 leading crops increased in the same period from 3,198,000 to 3,491,000. The value per acre of the leading crops for 1926 may be compared with the values for the United States as a whole as follows: wheat, $22.18 (U.S., $17.65); rye, $12.00 (U.S., $9.51); corn, $33.25 (U.S., $17.12); oats, $22.79 (U.S., $11.25); barley, $22.10 (U.S., $13.38); potatoes, $152.00 (U.S., $160.26); tame hay, $30.55 (U.S., $20.68). Wheat is the principal grain, the State ranking fourth among the States in production in 1923, tenth in 1924, third in 1925, and seventh in 1926. The banner crop of 61,215,000 bu. in 1923 slumped in the off year of 1924 to 26,380,000 bu., and amounted to 40,251,000 bu. and 40,271,000 bu. respectively in 1925 and 1926. The average yield per acre in the latter years was 19·4 bu. and 19·1 bu., while the value of the crop decreased from $52,434,000 in 1925 to $46,727,000 in 1926. In 1926 9,847,000 bu. of oats valued at $5,219,000 were raised, also 1,715,000 bu. of corn valued at $1,629,000 and 2,176,000 bu. of barley valued at $1,414,000. These three all showed a slight decrease in amount and value from 1925, but an increase over the results of 1924. In 1926 10,720,000 bu. of potatoes valued at $10,184,000 were raised as compared with 8,680,000 bu. worth $14,322,000 in 1925. Next came hay, the 1926 tame hay crop of 2,055,000 tons (2·23 tons per acre) being worth $28,154,000.

The development of fruit-raising in Washington since 1909 has been almost spectacular, the irrigated valleys on the eastern slopes of the Cascades being especially famous for their orchard products. The production of apples increased from 2,672,000 bu. in 1909 to 34,030,000 bu. in 1926, the value of the crop in the latter year being $25,522,500. Vineyards are a recent development, yielding 1,732 tons in 1924, 3,100 tons in 1925 and 2,500 tons in 1926. The climate is especially favourable to strawberries, loganberries and blackberries, which are increasing. The strawberry crop in 1926 was 10,788,000 quarts at $1,725,080.

Owing to severe depression in wool prices the number of sheep grazed in Washington decreased from 624,000 head in 1920 to 451,000 head in 1922. It then increased gradually to 526,000 head in 1927 valued at $5,797,000. The wool production in 1926 was 4,194,000 lb., valued at $1,262,394. From 1920 the State assumed first place in the average weight of fleeces, the 1926 weight averaging 9·8 lb. as compared with the 7·8 average for the entire United States. Cattle in 1927 numbered 544,000 head valued at $27,696,000. Of this number 264,000 were milch cows valued at $74.00 per head, or $19,536,000. Creamery butter production increased from 16,407,000 lb. in 1918 to 25,673,000 lb. in 1925, and cheese production from 1,145,000 lb. to 3,076,000 pounds.



Mining.—The average annual value of the mineral production of Washington from 1918 to 1924 inclusive was $20,943,509. A peak production of $26,677,191 was reached in 1920 followed by depression in 1921 when the total dropped to $17,605,878. By 1925 production had recovered to a value of $22,382,132. The most important mineral produced was coal, of which an average of 2,601,000 tons annually was mined from 1921 to 1925 inclusive. The production for 1923 was 2,926,000 tons valued at $10,894,000 and for 1925, 2,537,890 tons valued at $9,176,000. The coal industry in 1923 employed 4,306 persons for an average of 213 days each. Approximately one-half the output came from Kittitas county, with King, Pierce and Thurston counties next in order. Cement is next to coal in the value of its output. Four plants located at Bellingham, Concrete, Metaline Falls and Irvin produced 1,842,113 bbl. in 1924 and 2,499,237 bbl. in 1925. The value of the 1925 output was $5,523,324. Clay products valued at $2,619,250, building stone valued at $1,042,165, sand and gravel valued at $1,763,153 and lime valued at $357,297 were the other important non-metallic minerals mined in 1925.

The total value of the leading metals, gold, silver, copper, lead and zinc was $1,065,666 in 1923, an increase of 83% over that of 1922. The increase was distributed among all five metals, and the total was close to the average annual total for the decade 1913–23. The production of gold increased from $186,965 in 1922 to $342,067 in 1923, but dropped to $230,253 in 1925. More than 98% of the gold came from gold ore, largely from Ferry and Whatcom counties. The production of silver was 205,046 oz. troy in 1922 and 155,952 oz. troy in 1926; its value decreased from $205,046 to $97,314. Copper increased from 317,203 lb. in 1922 to 1,184,807 lb. in 1925 and 1,336,617 lb. in 1926 (value in 1925, $164,586). Lead production also was more than doubled in 1923, the value of its output for 1922, 1923 and 1925 being respectively $75,966, $203,454 and $489,570. In the production of magnesite Washington ranked, in 1926, first in quantity (79,561 short tons) and second to California in value ($596,700).

Forests and Lumbering.—Since 1905 Washington has led all States in the production of lumber, except in 1914, when Louisiana reported a larger cut. From 1919 to 1926 Washington each year cut about one-seventh of the annual production of the entire

United States. The cut in 1919 amounted to 4,961,000,000 board feet, in 1923 to 6,678,000,000 board feet, and in 1924 to 6,267,000,000 board feet. About 75% of the State's timber cut is of the valuable Douglas fir, this amount being nearly two-thirds of the cut of this species in the United States. Hemlock, spruce, western yellow pine and cedar each represents from 4 to 6% of the total cut. Larch, Idaho white pine and white fir are also important.

By far the greater part of the forests lies west of the Cascade range. The eastern section had at one time a good stand of pine, but these lands have given way to cultivated orchards. A great deal of the timber now lies in the ten national forests totalling 9,637,083 ac., which occupy the mountainous sections of the State and also furnish grazing.

LUMBER PRODUCTION, 1889–1927

Fisheries.—Washington, having passed the peak of her development in the salmon and halibut fisheries, relinquished her place as the leader in Pacific coast fisheries to California in 1922. The number of persons engaged in this industry dropped from 14,645 in 1915 to 7,600 in 1922; the investment dropped from $14,129,553 to $10,711,500, and the value of products from $5,320,725 to $4,953,913. In 1923 the fisheries employed 5,399 men, and yielded 114,379,148 lb. of fishery products valued at $7,692,005. There were 267 vessels, 1,751 power boats, and 289 row-boats and scows used in the operations.

Manufacturing, Transport and Commerce.—The growth of manufactures has been gradual but steady, paralleling the steady increase in the production of the raw products upon which it is dependent. There were in 1921 2,908 factories employing 77,518 workers, paying $99,191,000 in wages and producing goods valued at $448,165,000. Four years later the industry had increased to 3,216 establishments employing 105,893 wage-earners paying $146,224,608 in wages, and manufacturing goods to the value of $659,339,836. The industries leading in value of products in 1925 were: lumbering and saw-mill products, $253,070,780; milling of grain, $39,831,878; slaughtering and meat packing, $32,309,822; butter, cheese and evaporated milk, $24,801,794; planing mill products, $20,474,757; foundry and machine shops, $16,665,398; steam railway repair shops, $16,582,294; printing and publishing, $16,549,488; bakeries, $16,399,011; paper and wood-pulp, $14,683,472; and canning and preserving of fruits and vegetables, $14,242,892. Shipbuilding, one of the State's chief industries, with an output valued at $10,829,812 in 1916 and $166,519,787 in 1919, had declined by 1925 to $4,082,084. The gross tonnage built was 634,272 in 1919, 50,710 in 1921 and 8,945 in 1923.

Seattle was, in 1925, the leading manufacturing centre, having 1,005 establishments, producing $159,565,671 worth of products and paying $27,610,151 wages to 19,220 workers. Tacoma was next in importance with 289 establishments, turning out $71,001,327 worth of products, and paying $16,148,854 wages to 12,315 workers. Spokane was third with 261 establishments producing goods to the value of $43,529,928 and paying $7,980,609 in wages to 6,098 workers. Washington has water-power resources above those of any other State.

Puget sound has formed a natural terminus for several transcontinental railways, the cities of Seattle and Tacoma on its shores affording outlets to the commerce of the Pacific for the Northern Pacific, the Great Northern and the Chicago, Milwaukee and St. Paul transcontinental lines, which enter these cities over their own tracks. The Union Pacific, the Burlington, the Canadian Pacific and the Grand Trunk lines reach Seattle over the tracks of other roads. The railway mileage in 1926 was 5,559 m.

The highways of the State are in excellent shape, an average of $16,000,000 annually having been spent upon them from 1920 to 1926. There are in the State 49,016 m. of road of all types, of which 17,271 m. were surfaced in 1926. Paved roads totalled 2,304 miles. The State highway system included 3,284 m. of highway, of which 2,304 m. were surfaced.

The ocean commerce of Washington ports has shown a steady increase. In 1926 the imports were 1,084,919 tons and exports 2,515,402 tons. Seattle was the leading port with a total of 1,189,359 tons, while Tacoma followed with 887,562 tons. Grays Harbor was third with exports of 689,072 tons, but few imports.

History.—Sailing southward after an expedition northward to 55° lat., a Spanish captain, Juan Perez, one day in June 1774, saw a snow-clad peak in lat. 48° 10′ which he named Santa Rosalia, but which to-day is known as Mt. Olympus. So far as is definitely known, this is the first time that a white man looked upon a part of what is now Washington State. Another Spaniard, Heceta, was in the following year the first man to land on its shores, which he did at the cost of six men, killed by the Indians that they might secure the metal in the white men's boat. In 1778 the great British explorer, Captain Cook, on his third and last voyage, coasted along these shores. Captain John Meares, also an Englishman, in 1788 discovered and named San Juan strait, rechristened Mt. Olympus, and searched the shores for the legendary "river of the west." Though actually within its bay, he failed to perceive the hidden mouth of the Columbia and named the inlet Deception bay and its neighbouring headland Cape Disappointment. In the four years following a number of ships, American, British and Spanish, engaging mostly in the fur trade, reached these coasts, but did not systematically explore them. Then in 1792 came the Englishman, Vancouver, who discovered, named and thoroughly explored Puget sound, doing his work so well that some 70 or 80 of his geographical names remain, among them the Gulf of Georgia, Hood canal, Admiralty Inlet, Mt. Baker and Mt. Rainier. In that year also Robert Gray, an American from Boston, not only discovered Grays Harbor, but finally spied the long-sought "river of the west," which he named after his ship, the "Columbia." This discovery gave the United States its first claim to the "Oregon Country," as the land drained by the Columbia was called.

This claim was furthered by the first land exploration, that of Lewis and Clark in 1805–06. They entered Washington from Idaho by the Snake river, which they followed to the Columbia and thence to the sea. Their return the next spring was by the same route. The fur trade, which had proved so profitable by water, was now to be attempted on land almost simultaneously by the British and Americans. David Thompson, the dauntless explorer and geographer of the Northwest Company, a British concern, some time in 1810 built Spokane House where the Little Spokane enters the main Spokane river, the first permanent building in Washington. By the end of 1811 Thompson had explored the length of the Columbia valley. In March 1811 an expedition sent out by John J. Astor of New York to develop the fur trade of the region built a fort at the mouth of the Columbia and sent a party up the Columbia to the mouth of the Okanagan where a fort was built in opposition to Spokane House. But the war of 1812 forced the Americans out of the region and the British took over their forts. For the next 35 years the British fur companies ruled the Oregon country. The Hudson's Bay Company absorbed its rival, the Northwest Company, in 1821 and in 1824 sent John McLoughlin, the "father of Oregon," as its chief factor and governor west of the mountains. McLoughlin governed the region with a firm hand, but with a benevolent purpose for 22 years. On the northern bank of the Columbia in 1824–25 he built Ft. Vancouver, which became a port for ocean vessels.

In 1818 Great Britain and the United States reached an agreement whereby they were to hold the Oregon territory in "joint occupation" for ten years. This agreement was renewed again in 1827 for an indefinite term, with the proviso that it might be terminated by either party at 12 months' notice. By 1841 a considerable number of American settlers arrived in the region south of the Columbia, and immigration over the Oregon Trail was still greater in the years immediately following. But north of the river the Hudson's Bay Company discouraged American settlement, believing that the final decision of the Oregon controversy would make the Columbia river the boundary line between the two nations. Certainly north of the river the company seemed to have

the prior claim. In 1832 they built Nisqually House on Puget sound. They had large farms near Nisqually and on Cowlitz Prairie. They raised cattle enough to supply their settlers and shipped butter, cheese and beef to Sitka and other places. At the same time there was not a successful American settlement north of the Columbia. Yet in 1846 Great Britain agreed to accept the 49th parallel as the boundary and Washington became part of the United States. The Hudson's Bay Company were paid $650,000 for the developments they already had made in the territory.

Supported by the American board, Dr. and Mrs. Marcus Whitman founded in 1836 a mission south-east of the Columbia near the present site of Walla Walla. A school was started, fields were planted and Whitman ministered tirelessly to the physical and spiritual life of the Indians. In the winter of 1842–43 he rode over the Rocky mountains and the plains to win support from the board for his missionary projects, and his activities in the east did much to increase interest in the Oregon country. Catholic fathers also became active in the region, serving the Canadian employees of the Hudson's Bay Company as well as teaching and preaching to the Indians. Father Blanchet and Father Demers were the pioneer priests, arriving in 1838. In 1852 Father Demers preached the first sermon in the infant village of Seattle.

Of their own initiative the Oregon settlers set up a provisional government in 1843. There were not many settlers north of the Columbia to participate in this legislation, but such as there were, were under this Government until the United States Congress passed the Oregon bill in 1848, providing for the usual Territorial administration. Five years later (1853) the Oregon region was divided and Washington acquired its present name and a separate Territorial organization. The boundary ran along the Columbia river to the 46th parallel and thence east to the crest of the Rocky mountains. Washington did not assume its present shape until the Territory of Idaho was created in 1863. Isaac I. Stevens became the first governor. After his arrival he at once set to work to extinguish by purchase the Indian titles to land, and a series of treaties were held with all the tribes. These resulted in definite agreements and apparent friendships, but the tribes soon became alarmed by the rapid growth of the white population and attempted to drive them out. Between 1855 and 1859 there were many complicated Indian campaigns and a number of sharp engagements which resulted in the partial subduing of the natives.

The first permanent American settlement was made at Tumwater on Puget sound in 1845. Two miles away a town named Smithfield was begun in 1847. Later the name was changed to Olympia, and the place became the capital of the Territory and State. Ft. Steilacoom and Port Townsend were settled in 1850, Seattle in 1851, Bellingham and Tacoma in 1852. The Indian wars prevented settlement in eastern Washington until 1858 when a crowd of homeseekers and miners swarmed into the region, concentrating largely around Colville where the mines attracted attention. Gold discoveries on the Fraser river drew many farther east, and a settlement began to grow up around Ft. Walla Walla. After gold was discovered in the Clearwater region of Idaho (then still Washington Territory), Walla Walla became the outfitting point, and the brisk trade soon developed a lively city. In 1872 the first settlement at Spokane Falls was made, the nucleus of the city of Spokane. Supplying the mines in British Columbia, Idaho, Montana, Oregon and California with grain, meat, lumber and other needed articles proved lucrative business for the Territory. Rapid growth in wealth and population led to agitation for Statehood, and a Constitution was adopted in 1878, but Congress declined to pass an enabling act. The completion of the Northern Pacific railway in 1883 brought another period of swift increase in population. Statehood was finally granted in 1889. Trade along the Pacific coast became active after the Klondike gold discoveries of 1897. As outfitting and supply points the sound cities especially benefited from this activity, and at this time a period of bitter rivalry began between them for dominance in the trade of the sound. The Alaska-Yukon Exposition was held at Seattle in 1909, and its success helped that city and benefited the State as well.

In politics Washington has been Republican in national elections, except in 1896 when it was carried by a fusion of Democrats and Populists, in 1912 when it was carried by the Progressives for Roosevelt, and in 1916 when Wilson carried it for the Democrats. The Republicans controlled the governorship from the time of the State's admission into the Union in 1889 up to 1928, except for the administrations of Rogers (Populist, 1897–1901) and Lister (Democrat, 1913–21).

WASHINGTON, a city and the capital of the United States of America, coterminous with the District of Columbia, on the north-east bank of the Potomac river at the head of tide and navigation, 40 m. S.W. of Baltimore, 135 m. S.W. of Philadelphia, and 226 m. S.W. of New York. Area, 60 sq.m. (exclusive of 10 sq.m. of water surface). Pop. (1890) 230,392; (1900) 278,718; (1910) 331,069; (1920) 437,571; (1928, estimated) 552,000. In 1920, 29,365 were foreign-born and 109,966 negroes.

Streets and Parks.—The original plan of the city, which was prepared by Maj. Pierre C. L'Enfant (1755–1825), under the supervision of President Washington was a masterpiece in landscape architecture and in the main it has been preserved. The actual surveying and laying out of the city was done by Maj. Andrew Ellicott (1754–1820), another engineer officer, who had been employed in many boundary disputes and became surveyor-general of the United States in 1792, and from 1812 until his death was professor of mathematics at the U.S. Military academy at West Point. Besides streets running east and west, which are named by the letters of the alphabet, and streets running north and south, which are numbered, there are avenues named after various States, which radiate from two foci—the Capitol and the White House—or traverse the city so as to afford short routes to or around the perimeter of the old city. North and south of the Capitol the streets are numbered; east and west from it they are lettered, but streets are distinguished by annexing to the name or letter the name of the quarter: N.W., S.W., N.E. or S.E.—the city is divided into these four parts by North Capitol, East Capitol and South Capitol streets and the Mall parkway, which intersect at the Capitol. The width of the avenues is from 120 to 160 ft. and the width of the streets from 80 to 120 feet.

Among the principal residence streets are Massachusetts, especially between Dupont and Sheridan circles, New Hampshire, Connecticut and Vermont avenues and 16th street, all in the N.W. quarter of the city. The principal down-town business streets are Pennsylvania avenue and 7th, 9th, 14th, F and G streets. Streets and avenues for the most part are paved with asphalt, and many of them have two and occasionally four rows of overarching shade trees and private lawns on either side. At nearly every intersection of two avenues is a circle or square in which is the statue of some notable American whose name the square bears. At the intersection of a street with an avenue there is usually the reservation of a small triangular grass plot. In L'Enfant's plan a broad parkway or mall was to extend from the

Capitol westwards to meet a similar park development south of the White House. At their intersection he proposed a monument to Washington. This plan has substantially been carried out.

In 1901 a commission (Daniel H. Burnham, C. F. McKim, Augustus St. Gaudens and F. L. Olmsted, Jr.) was appointed by authority of the U.S. Senate to prepare plans for the beautification of the city and this body's most important recommendation was for an appropriate development of L'Enfant's ideas for the Mall avenue, with a group of official and scientific buildings fronting it on either side, and a group of Government office buildings between the Mall and Pennsylvania avenue, with a Lincoln memorial on the bank of the Potomac in prolongation of the Mall axis. Potomac park (723 ac.), a portion of which is embraced in this design, has already been reclaimed from the Potomac river.

On Rock creek, above Georgetown, is the National Zoological park (under the control of the Smithsonian Institution), embracing 170 ac. in a picturesque site. North of this and extending to the boundary of the District, and including both banks of Rock creek, with its wild and picturesque beauty, is a tract of 1,600 ac., known as Rock Creek park. There are numerous smaller parks, parkways and playgrounds. An act of 1924 created the national capital park commission to acquire land for park, parkway and playground purposes. Two years later the scope of this commission was enlarged and its name was changed to the national capital park and planning commission.

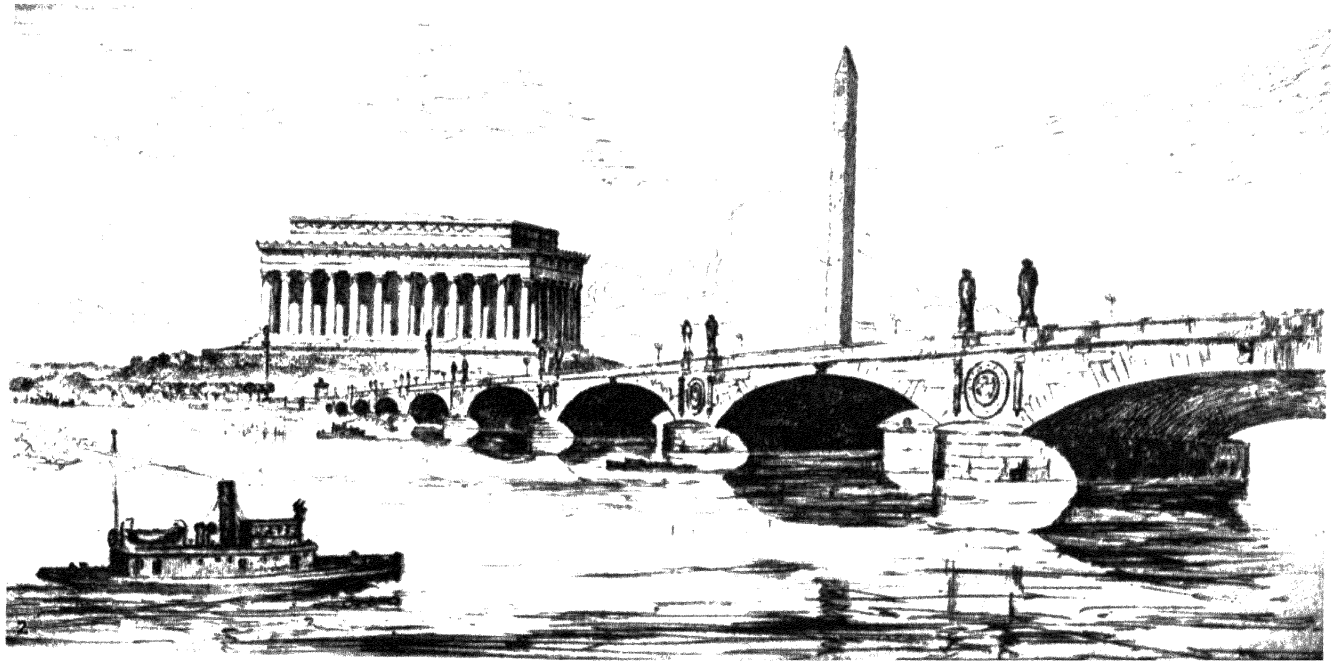
Climate.—The climate of Washington is characterized by frequent periods of high humidity, occasional periods of oppressive heat in summer and moderately mild winters. During the period of 49 years ending Dec. 1921, the mean winter temperature (December, January and February) was 35° F and the mean summer temperature (June, July and August) 75°; the mean of the winter minima was 27°, and the mean of the summer maxima 84°. Extremes ranged, however, from the absolute maximum of 106° to an absolute minimum of −15°. There is an average annual precipitation of 42·2 in., which is evenly distributed.

Buildings.—In a dignified landscape setting on the brow of a hill 88 ft. above the Potomac stands the Capitol (built 1793–1827; architect William Thornton, superintendent of the Patent Office, whose designs were modified by B. H. Latrobe and Charles Bulfinch; extension wings and dome added 1851–65). It consists of a central building of Virginia sandstone, painted, and two wings added to the original building of white Massachusetts marble. The cornerstone of the original building was laid on Sept. 18, 1793, by President Washington, with Masonic ceremonies. On Aug. 24, 1814 (during the War of 1812), the interior of both wings of this building was destroyed by fire, started by the British forces. The cornerstone of the extension wings (Senate and House) was laid on July 4, 1851, by President Fillmore, Daniel Webster officiating as orator (architect Thomas U. Walter). The length of the Capitol building over all is 751 ft. 4 in., and its breadth ranges in different parts from 121 ft. to 350 feet. The main building is surmounted with an iron dome, designed by Thomas U. Walter, which rises to the height of 287 ft. 5 in., and on the dome is a statue of Freedom (1863; 19½ ft. high) by Thomas Crawford.

The Capitol faces east, and on this side is a richly sculptured portico with Corinthian columns flanked on either side by colossal groups of statuary (the group on the north side known as the "Rescue Group" is by Horatio Greenough, and the "Discovery Group" on the south side by Luigi Persico, who executed the statues "Peace" and "War" under the portico and the sculptural decorations of the pediment) leading to the rotunda under the dome, a sculptured Corinthian portico leading to the Senate Chamber in the north wing, and a sculptured Corinthian portico leading to the Hall of Representatives in the south wing; there is also a portico at each end and on the west side of each wing. Over the bronze door (by Randolph Rogers) is a bas-relief by Antonio Capallano. The rotunda, 96 ft. in diameter and 180 ft. high, is decorated with eight historical paintings: "Landing of Columbus" (1492), by John Vanderlyn; "De Soto discovering the Mississippi" (1541), by William H. Powell; "Baptism of Pocahontas" (1613), by John G. Chapman; "Embarkation of the Pilgrims from Delft-Haven" (1620), by Robert W. Weir; "Signing the Declaration of Independence" (1776), "Surrender of Burgoyne at Saratoga" (1777), "Surrender of Cornwallis at Yorktown" (1781) and "Washington resigning his Commission at Annapolis" (1783), by John Trumbull.

Between the rotunda and the Hall of Representatives is the National Hall of Statuary (formerly the Hall of Representatives), in which each State in the Union may erect statues of two of her "chosen sons"; and between the rotunda and the Senate Chamber is the room of the Supreme Court, which until 1859 was the Senate Chamber. Connected with the Capitol by subways, immediately south-east and north-east of the Capitol respectively, are the marble office buildings (1908) of the House of Representatives and of the Senate. The Capitol is connected by subways with the Library of Congress also.

The Executive Mansion, more commonly called the White House, the official residence of the president, is a two-storey building of Virginia freestone, painted white since 1814 to hide the marks of fire—only the walls were left standing after the capture of the city by the British in that year. It is 170 ft. long and 86 ft. deep. It is simple but dignified; the principal exterior ornaments are an Ionic portico and a balustrade. The White House was built in 1792–99 from designs by James Hoban, who closely followed the plans of the seats of the dukes of Leinster, near Dublin, and remodelled in 1902–03, when the president's office was moved out of the White House itself into new quarters nearby and the interior brought back more nearly into accord with the original mansion of Hoban. The White House was re-roofed and in other ways remodelled during the spring and summer of 1927. East of the White House and obstructing the view from it to the Capitol stands the oldest of the departmental buildings, the Treasury building (architect, Robert Mills, 1781–1855, then U.S. architect), an imposing edifice mainly of granite, 510 ft. long and 280 ft. wide; on the east front is a colonnade of 38 Ionic columns, and on each of the other three sides is an Ionic portico. On the opposite side of the White House is a massive granite building of the State, War and Navy Departments, 567 ft. long and 342 ft. wide.



The Library of Congress (1889–1897); original cost, exclusive of site, over $6,347,000, south-east of the Capitol, was designed by Smithmeyer and Pelz, and the designs were modified by Edward Pearce Casey (b. 1864). The architect (Gen. Thomas Lincoln Casey, chief of engineers U.S. army) was in charge of construction. It is in the Italian Renaissance style, is 340 by 470 ft., and encloses four courts and a central rotunda surmounted by a flat black copper dome, with gilded panels and a lantern. The exterior walls are of white New Hampshire granite, and the walls of the interior courts are of Maryland granite and white enamelled bricks. There are numerous sculptural adornments without, and there is elaborate interior decoration with paintings, sculpture, coloured marbles and gilding.

A bronze fountain, "The Court of Neptune," in front of the Library, is by Hinton Perry. Granite portrait busts of great authors occupy niches in windows near the entrance; these are by J. S. Hartley, Herbert Adams and F. W. Ruckstuhl. The allegorical figures over the entrance are by Bela L. Pratt. There are fine bronze doors by Olin Warner and Frederick MacMonnies. Among the mural paintings are series by John W. Alexander, Kenyon Cox, E. H. Blashfield, Henry O. Walker, Walter McEwen, Elihu Vedder, Charles S. Pearce, Edward Simmons, George W. Maynard, Robert Reid, George R. Barse, Jr., W. A. Mackay, F. W. Benson, Walter Shirlaw, Gari Melchers, W. De L. Dodge and others.

Two squares north of the Senate Office building is the Union railway station (1908; 343 by 760 ft.; cost, $4,000,000), designed by Daniel Hudson Burnham, consisting of a main building of white granite (from Bethel, Vt.) and two wings, facing a beautiful plaza. On Pennsylvania avenue, nearly midway between the Capitol and the White House, is the nine-storey Post Office (1899; with a tower 300 ft. high), housing the U.S. Post Office Department. A few squares north-west of it are the General Land Office and the Patent Office, with Doric portico; a little farther to the

WASHINGTON SCENES

FROM ETCHINGS BY ANTON SCHUTZ

1. The White House, home of the President of the United States. 2. Arlington Memorial Bridge showing the Lincoln Memorial (left) and the Washington Monument (right) in the background

WASHINGTON

LOOKING DOWN ALONG THE MALL

Looking toward the Capitol between the columns of the Lincoln Memorial from an etching by Anton Schutz. Washington monument is seen in the foreground. The McMillan Plan for a parkway extending the entire distance along the Mall from the Lincoln Memorial to the Capitol adds largely to the attractiveness of the view

east the Pension Office building, now occupied by the General Accounting Office; the Government Printing Office (12 storeys—one of the few tall office-buildings in the city); the City Hall or District Court House; and to the west on Pennsylvania avenue, the District building (1908), another building of the local government. On the height north of Georgetown is the U.S. Naval Observatory, one of the best-equipped institutions of its kind; from it Washington time is telegraphed daily to all parts of the United States. North-east of the Naval Observatory is the Bureau of Standards. Near Rock creek, east of Georgetown, is the headquarters of the U.S. Weather Bureau.

In the Mall are the buildings of the Department of Agriculture, the Smithsonian Institution (*q.v.*), the National Museum (1910), the Army Medical Museum and the Bureau of Fisheries. South of the Mall and facing Potomac park is the home of the Bureau of Engraving and Printing, in which the U.S. paper money and postage stamps are made. Along 17th street, framing the grounds south of the White House are several notable semi-public buildings: the Pan-American building (1910; Kelsey and Cret architects), the D.A.R.'s Continental Hall (1910; E. P. Casey, architect), the Red Cross Building (1917; Trowbridge and Livingstone, architects), and the Corcoran Gallery of Art (1894–97; architect, Ernest Flagg), housing a collection of paintings (especially American portraits) and statuary; the gallery was founded and endowed in 1869 by William Wilson Corcoran (1798–1888) "for the perpetual establishment and encouragement of the Fine Arts." The Public Library, a gift of Andrew Carnegie, is a white marble building in Mt. Vernon square, at the intersection of Massachusetts and New York avenues. The old Ford's theatre, in which President Lincoln was assassinated, was on Tenth street N.W. between E and F. The house in which Lincoln died is on the opposite side of the street, and contains relics of Lincoln mostly collected by O. H. Oldroyd.

Monuments.—Foremost among the city's many monuments is that erected to the memory of George Washington. It is a plain obelisk of white Maryland marble, 55 ft. square at the base and 555 ft. in height; it was begun in 1848, but the work was abandoned from 1855 to 1877. It was completed in 1884 at a cost of $1,300,000. The site is said to have been chosen by Washington himself—Congress had planned a marble monument in 1783. In 1833 the Washington National Monument Society was formed and a popular subscription was taken. The obelisk was designed by Robert Mills, whose original plan included a "Pantheon" 100 ft. high with a colonnade and a colossal statue of Washington. After 1877 the work was carried on by an appropriation made by Congress under the direction of Col. Thomas L. Casey, Corps of Engineers. Among statues of Washington are the half-nude seated figure (1843) by Greenough in the Smithsonian Institution, and an equestrian statue (1860) of Washington at the Battle of Princeton by Clark Mills in Washington circle. At the foot of Capitol hill and the east end of the Mall is an equestrian statue of Gen. Grant (1922) with decorative side groups (by H. M. Shrady) and near-by an allegorical monument to Gen. G. G. Meade (by Charles Grafly).

Among the other prominent statues are: the equestrian statue (1908) of Gen. Philip H. Sheridan in Sheridan circle, by Gutzon Borglum; an equestrian statue of Gen. Sherman near the Treasury building, by Carl Rohl-Smith; a statue of Frederick the Great (by T. Uphues; presented to the United States by Emperor William II. of Germany) in front of the Army War college at the mouth of the Anacostia river; a statue of Gen. Nathanael Greene (by H. K. Brown) in Stanton square; statues of Gen. Winfield Scott in Scott square (by H. K. Brown) and in the grounds of the Soldiers' Home (by Launt Thompson); a fountain (by Daniel C. French) in memory of Rear-Admiral S. F. Du Pont in Du Pont circle; statues (by J. E. Fraser) of Alexander Hamilton on the Treasury steps and of John Ericsson in west Potomac park; of Rear-Admiral D. G. Farragut (by Vinnie Ream Hoxie); an equestrian statue of Gen. George H. Thomas (by J. Q. A. Ward), erected by the Society of the Army of the Cumberland; one of Gen. George B. McClellan, by Frederick MacMonnies; and statues of Lincoln, by Scott Flannery (in Lincoln park), by Thomas Ball and (in the Lincoln memorial) by Daniel C. French, of Joseph Henry (by W. W. Story) in the grounds of the Smithsonian Institution, of John Marshall (by Story) on the west terrace of the Capitol, of Gen. Andrew Jackson (by Clark Mills) and, in Lafayette square, of the Marquis de Lafayette (by Falguière and Mercié), of the Comte de Rochambeau (by F. Hamar) and of Baron von Steuben. A white marble memorial to Columbus (by D. H. Burnham) stands in front of the Union station. In Pennsylvania avenue, at the foot of Capitol hill, is a "Monument of Peace" (by Franklin Simmons) in memory of officers, seamen and marines of the U.S. navy killed in the Civil War.

Cemeteries.—On the opposite side of the Potomac, in Virginia, and adjoining Ft. Myer, a military post (named in honour of Gen. Albert James Myer [1827–1880], who introduced in 1870 a system of meteorological observations at army posts) with reservation of 186 ac., is Arlington, a national cemetery (of 408·33 ac.), in which lie buried 21,106 soldiers killed in the Civil War and in the war with Spain; and 5,140 of those killed in the World War; among the distinguished officers buried here are Gen. Philip H. Sheridan, Admiral David D. Porter, Gen. Joseph Wheeler and Gen. Henry W. Lawton. The cemetery also contains the tomb of the Unknown Soldier of the World War; there is a Spanish War Monument; the grounds are noted for their natural beauty, and on the brow of a hill commanding a magnificent view of the city is Arlington House (1802), the residence of George Washington Parke Custis (1781–1857), grandson of Martha Washington, and afterwards of Gen. Robert E. Lee, Custis's son-in-law; the estate was seized by Federal troops early in the Civil War, and was bought by the United States in 1864 at a delinquent tax sale but the title was not cleared until 1884 when the U.S. Government paid G. W. Custis Lee $150,000 for his claim to the property. There was a military hospital here throughout the Civil War. Adjoining the grounds of the Soldiers' Home (3 m. N. of the Capitol) is a national military cemetery containing the graves of 7,220 soldiers. On the bank of the Anacostia river, east of the Capitol, is the Congressional cemetery containing the graves of many members of Congress. North of Georgetown is Oak Hill cemetery, and in the vicinity of the Soldiers' Home are Rock Creek, Glenwood, Harmony, Prospect Hill and St. Mary's cemeteries. A crematorium was completed in 1909, and cremation instead of interment has since been urged by the District commissioners.

Charities, etc.—The National Soldiers' Home (1851), founded by Gen. Winfield Scott, comprises five buildings, with accommodations for 800 retired or disabled soldiers, and 512 ac. of beautiful grounds. The charitable and correctional institutions of the District of Columbia are the following Government institutions, under the control of the United States or of the District of Columbia: Freedmen's hospital (1862), U.S. Naval hospital (1866), U.S. Army hospital, Gallinger Municipal hospital, Tuberculosis hospital; St. Elizabeth's hospital (for insane) on the east bank of the Anacostia river, Industrial Home school (1872), a municipal lodging house (1892), a Soldiers' and Sailors' Temporary home (1888), workhouse, District of Columbia Reformatory, Washington asylum and jail, National Training School for Girls (one for whites and one for negroes), District Training school, Industrial Home School for Coloured Children, Home for the Aged and Infirm.

Among many semi-private and private institutions are the Washington City Orphan asylum; Lutheran Eye, Ear and Throat infirmary; Garfield Memorial hospital; Episcopal Eye, Ear and Throat hospital; Central dispensary and Emergency hospital; Providence hospital (Sisters of Charity); George Washington University hospital; Georgetown University hospital; Columbia Hospital for Women; Children's hospital; Eastern Dispensary and Casualty hospital; Washington Hospital for Foundlings; Children's Temporary home (for negroes); a German Orphan asylum; Washington Home for Incurables; Home for the Aged; the National Lutheran home; the Methodist home and Baptist home; National Training School for Boys; Florence Crittenden home; Southern Relief Society; Columbia Polytechnic Institute

for the Blind. A "non-support law," which came into effect in 1906, enacts that a man who refuses to provide for his family when able to do so shall be committed to the workhouse for hard labour, and that 50 cents a day shall be paid to his family. An act of June 22, 1916, provides for allowances to mothers for the home care of dependent children under 16 years of age. A juvenile court has extensive jurisdiction over dependent and delinquent children, and a general supervision of all charities and corrections is vested in a board of public welfare consisting of nine members appointed by the commissioner of the District of Columbia.

Education.—Washington is one of the leading educational centres of the United States. It is here that the Army War college is situated. The public school system, under the control of a board of education of six men and three women appointed by the supreme court judges of the District of Columbia, embraces kindergartens, primary, grammar, junior high, high, a business high school, manual training, normal and night schools. The schools are open 9 months in the year, and all children between 8 and 14 years of age are required to attend some public, private or parochial school during these months unless excused because of some physical or mental disability. The Army Medical school is situated here. George Washington university, in the vicinity of the White House, is a non-sectarian institution (opened in 1821 under the auspices of the Baptist General Convention as "The Columbian College in the District of Columbia"; endowed by W. W. Corcoran in 1872, organized as the Columbian university in 1873, organized under its present name in 1904), and comprises Columbian college of arts and sciences with a graduate department (1893), a college of the political sciences (1907), Washington college of engineering, divisions of architecture and education (1907), a department of law (first organized in 1826; closed in 1827; reorganized in 1865), a department of medicine (1821; since 1866 in a building given by W. W. Corcoran), with several affiliated hospitals, a department of dentistry (1887), the national college of pharmacy (united with the university in 1906) and a college of veterinary medicine (1908). Georgetown university (organized 1789) is in Georgetown. In 1926 it had 231 instructors and 2,322 students.

The Catholic University of America (incorporated 1887; opened 1889), with buildings near the Soldiers' Home, stands at the head of Roman Catholic schools in America. Although designed especially for advanced theological studies, it comprises schools of the sacred sciences, philosophy, letters, physical sciences, biological sciences, social sciences, jurisprudence, law and technological sciences. In 1926 its faculty numbered 112 and its students 863. A Franciscan convent, Dominican, Paulist and Marist houses, and Trinity college for girls are affiliated with the Catholic university. The American university (chartered 1893 as a graduate school), under Methodist Episcopal control, has a campus of 94 ac. at the north-west end of the city and in 1926 had 55 instructors and 308 students. Howard university (1867), for the higher education of negroes, is situated south-west of the Soldiers' Home; it was named in honour of Gen. Oliver O. Howard, one of its founders and (in 1869–73) its president; it has a small endowment, and is supported by Congressional appropriations which are administered by the secretary of the Interior; it comprises an academy, a college of arts and sciences, a teachers' college, schools of theology, law and medicine, a pharmaceutic and a dental college, a school of manual arts and applied sciences and a commercial college; in 1926 it had 152 instructors and 2,137 students.

The Columbia Institution for the Deaf and Dumb, on Kendall Green, in the north-eastern part of the city, is composed of Kendall school (a secondary school) and of Gallaudet college (called in 1864–93 the National Deaf Mute college; the present name is in honour of Dr. T. H. Gallaudet); it was the first institution to give collegiate courses to the deaf, and it has received Congressional appropriations, though it is a private foundation. Washington has also several academies, seminaries and small colleges. Among the latter are St. John's college (Roman Catholic, 1870), Washington Christian college (non-sectarian, 1902), Catholic Sisters' college (1911), National university (1869), Trinity college (1900), U.S. College of Veterinary Surgeons (1894), Washington College of Law (1896), Washington Missionary college (1904). The Washington College of Law (1896) is an evening school especially for women. A school of art is maintained in the Corcoran Gallery of Art. There are also the National School of Fine and Applied Art, Washington School of Art, Arts and Crafts school, Critcher-Hill School of Art, Abbott School of Fine and Commercial Arts, Livingston academy and Columbia School of Draughting.

The Carnegie Institution of Washington, founded by Andrew Carnegie in 1902 and endowed by him with $22,000,000 ($10,000,000 in 1902; $12,000,000 later), is designed "to encourage in the broadest and most liberal manner, investigation, research and discovery, and the application of knowledge to the improvement of mankind; and in particular to conduct, endow and assist investigation in any department of science, literature or art, and to this end to co-operate with governments, universities, colleges, technical schools, learned societies and individuals; to appoint committees of experts to direct special lines of research; to publish and distribute documents; and to conduct lectures, hold meetings and acquire and maintain a library." It is under the control of a board of 24 trustees, vacancies in which are filled by the remaining members.

In 1908 ten departments had been organized: botanical research, with a "desert laboratory" (1903) at Tucson, Ariz.; economics and sociology (1904); experimental evolution, with a station (1904) at Cold Spring Harbor, N.Y.; geophysical research, with a laboratory (1906–07) at Washington—investigations have been carried on by the U.S. Geological Survey and at McGill university, Montreal; historical research (1903); marine biology, with a laboratory (1904) at Tortugas, Fla.; meridian astrometry (1906; work is carried on especially at Dudley observatory, Albany, N.Y.); research in nutrition, with a laboratory (1906) at Boston, Mass.—investigations (since 1904) have been carried on at Yale and Wesleyan universities; solar physics, with observatory (1905) on Mt. Wilson, Calif., and workshops at Pasadena, Calif., and terrestrial magnetism (1903; headquarters in Washington); the institution began to assist Luther Burbank in his horticultural experiments in 1905; has published the *Index Medicus* since 1903; and makes occasional grants for minor research and tentative investigations.

The learned societies of Washington are to a large degree more national than local in their character; among them are: the Washington Academy of Sciences (1898), a "federal head" of most of the societies mentioned below; the Anthropological Society (founded 1879; incorporated 1887), which has published *Transactions* (1879 *seq.*, with the co-operation of the Smithsonian Institution) and *The American Anthropologist* (1888–98; since 1898 published by the American Anthropological Association); the National Geographic Society (1888), which since 1903 has occupied the Hubbard Memorial building, which sent scientific expeditions to Alaska, Mt. Pelée and La Souffrière, and which publishes the *National Geographic Magazine* (1888 *seq.*), *National Geographic Monographs* (1895) and various special maps; the Philosophical Society of Washington (1871; incorporated 1901), devoted especially to mathematical and physical sciences; the Biological Society (1880), which publishes *Proceedings* (1880 *seq.*); the Botanical Society of Washington (1901); the Geological Society of Washington (1893); the Entomological Society of Washington (1884), which publishes *Proceedings* (1884 *seq.*); the Chemical Society (1884); the Records of the Past Exploration Society (1901), which publishes *Records of the Past* (1902 *seq.*); the Southern History Association (1896), which issues *Publications* (1897 *seq.*); the Society for Philosophical Inquiry (1893), which publishes *Memoirs* (1893 *seq.*); the Society of American Foresters (1900), which publishes *Proceedings* (1905 *seq.*); and the Cosmos club. The libraries and scientific collections of the Federal Government and its various bureaux and institutions afford exceptional opportunities for students and investigators.

The Library of Congress contains more than 3,726,502 books and pamphlets, 1,000,000 manuscripts, 1,420,367 maps, 1,330,515

pieces of music and 469,062 prints. In the library of the State Department are 125,000 volumes of documents. The library of the surgeon-general's office of the army contains 850,000 volumes, and is the largest medical library in the world. Besides these there is a vast amount of material in the collections of the Bureau of Education, the Bureau of Ethnology, the Smithsonian Institution, the National Museum, the House of Representatives, the War College, the Public Health Department, the Patent Office, the Department of Agriculture, the Botanic Gardens, the Bureau of Fisheries, the Naval Observatory, the Geological Survey and the Coast and Geodetic Survey. The Public Library contains about 325,183 volumes in the main and seven branch libraries.

Communications.—Seven railways enter the city: the Pennsylvania, the Baltimore and Ohio, the Southern, the Chesapeake and Ohio, the Washington, Baltimore and Annapolis, the Washington Southern and the Washington, Alexandria and Mt. Vernon. Steamboats ply daily from the foot of Seventh street to Alexandria, Mt. Vernon, Old Point Comfort and Norfolk, and at Old Point Comfort there is connection with boats for New York. At irregular intervals there are boats direct to Baltimore, Philadelphia, New York and Boston. The street railways, underground trolley in the urban district and overhead trolley in the suburbs, and buses connect at several points with inter-urban railways in Maryland and Virginia.

Industries.—The city's manufactures and commerce are of little importance in proportion to its population. Only Government manufactures and manufactures for local consumption are at all large. In 1925 the Government's printing and publishing cost $11,532,954; its ordnance and ordnance stores (in the navy yard on the bank of the Anacostia river), $9,586,898; and its engraving and plate printing, $10,410,457.

Government.—Washington is the seat of the U.S. Federal Government and as such is not self-ruled, but governed by the Federal Congress. The city was chartered in 1802, with a mayor appointed annually by the president and an elective council of two chambers. The mayor was elected by the council from 1812 to 1820, and by the people (biennially) from 1820 to 1871. In 1871 the Federal Congress repealed the charters of Washington and Georgetown and established a new government for the entire District, consisting of a governor, secretary, board of public works, board of health and a council appointed by the president with the concurrence of the Senate, and a house of delegates and an elected delegate to the national House of Representatives.

In 1874 Congress substituted a government by three commissioners appointed by the president with the concurrence of the Senate, and in 1878 the government by commissioners was made permanent. Two of the commissioners must be residents of the District, and the third must be an officer of the Corps of Engineers of the U.S. army. The residents of the District have no voice in its government, have no representation in Congress and do not vote for the president of the United States. The District commissioners are the chief executive officers. Congress and the commissioners legislate for the District; the president, the commissioners and the supreme court of the District appoint the administrative officers and boards; and the president appoints the judges of the District courts, viz., a court of appeals, supreme court, municipal court, police court, probate court and juvenile court. About three-quarters of the expenses of the government of Washington are paid by the District of Columbia and about one quarter by the United States. The revenue of the District, which is derived from real estate and personal property taxes and from various licences, is paid into the U.S. Treasury; appropriations, always specific and based on estimates prepared by the commissioners, are made only by Congress; and all accounts are audited by the Treasury Department. The government owns the waterworks, by which an abundant supply of water is taken from the Potomac at the Great falls, conducted for 12 m. through two aqueducts one 9 ft. in diameter and the other horseshoe shape 79 sq.ft. in area (aqueducts interconnected) and filtered through two sand filtration plants. The government of the District has been in recent years uniformly excellent, and the laws therefor have been modern in their tendency.

History.—During the Revolutionary War Philadelphia was the principal seat of the Continental Congress, but it was driven thence in 1783 by mutinous soldiers, and for the succeeding seven years the discussion of a permanent site for the national capital was characterized by sectional jealousy, and there was a strong sentiment against choosing a State capital or a large city lest it should interfere with the Federal Government. The Constitution, drafted in 1787, authorized Congress "to exercise exclusive legislation in all cases whatsoever, over such district (not exceeding 10 sq.m.) as may, by cession of particular states, and the acceptance of Congress, become the seat of government of the United States." Virginia and Maryland promised such a cession; President Washington was known to be in favour of a site on the Potomac, and in July 1790 Alexander Hamilton, in return for Thomas Jefferson's assistance in passing the bill for the assumption of the State war debts by the Federal Government, helped Jefferson to pass a bill for establishing the capital on the Potomac, by which the president was authorized to select a site anywhere along the Potomac between the Eastern Branch (Anacostia) and the Conococheague river, a distance of about 80 m., and to appoint three commissioners who under his direction should make the necessary surveys and provide accommodations for the reception of Congress in 1800.

The commissioners—Thomas Johnson (1732–1819), Daniel Carroll (1756–1829) of Maryland and Dr. David Stuart of Virginia—gave the city its name; Maj. L'Enfant drew its plans and Maj. Andrew Ellicott laid it out. When in 1800 the Government was removed to Washington it existed principally on paper, and the magnificence of the design only served to emphasize the little progress made in its execution. One wing of the Capitol and the president's house were nearly completed, but much of the land surrounding the Capitol was a marsh; there were no streets worthy of the name, the roads were very bad, and the members of Congress were obliged to lodge in Georgetown. For many years such characterizations as "Wilderness City," "Capital of Miserable Huts," "City of Streets without Houses," "City of Magnificent Distances" and "A Mudhole almost Equal to the Great Serbonian Bog" were common. Resolutions were frequently offered by some disgusted member of Congress for the removal of the capital. In 1814, during the second war with Great Britain, the British, after defeating on Aug. 24, an American force at Bladensburg, Prince George county, Md., about 6 m. north-east of Washington, occupied the city and burned the Capitol, the president's house, some of the public offices and the navy yard. In the following year when a bill appropriating $500,000 for rebuilding was before Congress it met with formidable opposition from the "capital movers."

The question of removal was again to the front when, in 1846, the Virginia portion of the District was retroceded to that State in response to the appeal of Alexandria, which had suffered from the neglect of Congress. The lethargy of the nation toward its capital suddenly vanished at the outbreak of the Civil War. At the close of the first day's bombardment of Ft. Sumter (April 12, 1861) Leroy P. Walker (1817–84), the Confederate secretary of War, boasted that before May 1, the Confederate flag would float over the Capitol. The North, alarmed at the threat, speedily transformed Washington into a great military post in accordance with the plans of Maj. Gen. J. G. Barnard and protected it on all sides with strong earthworks.

Throughout the war it was the centre of the military operations of the North: here the armies were officered and marshalled, from here they marched on their campaigns against the South, here was the largest depot of military supplies, and here were great hospitals for the care of the wounded. Although several times threatened by the South, Washington was never really in danger except in July 1864 when Gen. Jubal A. Early advanced against it with 12,000 veterans, defeated Gen. Lew Wallace with about 3,500 men at Monocacy Bridge on the 6th, and on the 11th appeared before the fortifications, which were at the time defended by only a few thousand raw troops; the city was saved by the timely arrival of some of Grant's veterans. In the city, on May 23–24, 1865, President Andrew Johnson reviewed the

returning soldiers of the Union army.

The population of Washington increased from 61,122 to 109,199 or 78·6% in the decade, 1860 to 1870. The city had been founded on too elaborate and extensive a plan to be left to the initiative and unaided resources of its citizens. But under the new form of government which was instituted in 1871 a wonderful transformation was begun under the direction of Alexander R. Shepherd (1835–1902), the governor of the District and president of the board of public works. Temporary financial embarrassment followed, but the Federal Government took upon itself half the burden and established the economic administration of the commissioners. A national capital park and planning commission was instituted in 1926 with the duty of co-ordinating the efforts of the various Federal and municipal authorities.

WASHINGTON, a city of south-western Indiana, U.S.A., on Federal highway 50, near the White river; county seat of Daviess county. Population (1920) 8,743 (97% native white); estimated locally at 10,000 in 1928. The city was founded in 1816 and chartered in 1870.

WASHINGTON, a city of south-western Pennsylvania. Pop. (1920) 21,480 (83% native white; the remaining 17% about equally divided between negroes and foreign-born white); 1928 local estimate 25,000, with 5,000 more in contiguous suburbs. Washington lies among beautiful surroundings, at an altitude of 1,156 ft., in a fertile region, rich in bituminous coal (still largely unmined) and still producing oil and gas. It has important manufacturing industries, with an output in 1927 valued at $26,013,100. Among the leading products are annealing boxes, baby and doll carriages, brooms, cathedral glass, table glassware, plate and wire glass, glass containers, ferro-alloys, tin and terne plate, steel plates and tungsten. It is the seat of Washington and Jefferson college and of Washington seminary for girls (1836). The college is a consolidation (1865) of Washington college, founded in 1787 as an academy formed by the union of three schools established within 10 m. of Washington in 1780, 1781 and 1785, by three Presbyterian ministers, and Jefferson college, founded as an academy at Canonsburg in 1794. On South Main street, stands a house built in 1788, which was the headquarters of David Bradford, leader of the Whiskey Insurrection, in 1794. The site of Washington was part of a tract bought in 1771 by David Hoge, and was at first called Catfishes Camp, then for brief periods Dandrige Town and Bassett Town. In 1781 Hoge laid out a town, and gave lots (now part of the college campus and the site of the First Presbyterian church) to George and Martha Washington. The National road (first proposed by George Washington and urged by him throughout his life) was authorized by Congress in 1806, and the right of way was given in 1807 by Pennsylvania on condition that it should pass through the town of Washington, along the route of George Washington's first expedition into the west. The first crematory in the United States was established in Washington in 1876 by Francis Julius Le Moyne (1798–1879), the son of a French refugee. Through his ardent sympathy for the abolition movement he was influential in making Washington an important "station" on the "underground railroad." The town was incorporated in 1810 and became a city in 1924.

WASHINGTON, MOUNT, a peak of the White mountains in New Hampshire, alt. 6,293 ft. The Presidential range is about 20 m. in length, and contains nine other peaks exceeding 5,000 ft. in height. The sides of Mt. Washington are cut deep with ravines which offer some of its wildest scenery. Above the ravines (5,000–5,500 ft.) are comparatively level areas called "lawns"; from these rises the rounded bare-rock summit. The tree-line, which extends up its sides to an elevation of about 3,850 ft., gives away for the next 1,000 ft. of altitude to dwarf spruce, balsam and birch. This is followed by the real Alpine zone which extends to the summit. The flora of this region is chiefly Alpine flowers, sedges and lichens. The winter weather is very severe. Official weather records show temperatures as low as 60° below zero and storm winds exceeding 100 m. per hour. The region is plentifully supplied with water which finds its way into three rivers, the Androscoggin, the Connecticut and the Saco. Near the summit are two rock-rimmed and clear bodies of water known as the "Lakes of the Clouds."

The peak was first sighted from the ocean in 1605, and was first ascended in 1642 by Darby Field accompanied by two Indian guides. The mountain was given its present name by the Rev. Manasseh Cutler, who, with several companions, made a scientific trip to the summit in 1784. The Crawford path, which approaches from the south-west, was finished in 1821, and a few years later was made a bridle path to the summit. The carriage road, which was constructed during the years 1855–61, follows the prominent north-east ridge from Glen House to the summit. This makes it possible to climb the peak by automobile. The cog railway, which follows the westerly spur, was started in 1866 and completed in 1869. It operates between the Base station and the Summit house. Numerous trails and shelters are maintained, chiefly by the Appalachian mountain club.

See W. C. O'Kane, *Trails and Summits of the White Mountains* (1925) and *Guide to Paths in the White Mountains* (6 ed., 1925) published by the Appalachian mountain club.

WASHINGTON CONFERENCE. Preliminary invitations to a Conference at Washington on the limitation of national armament "in connection with which Pacific and Far Eastern questions could also be discussed" were issued by President Harding in July 1921, to Great Britain, France, Italy and Japan. On Aug. 11, formal invitations were sent to these Powers, to China and later to Belgium, the Netherlands and Portugal, President Harding having been authorised by Congress on July 11, 1921, to arrange for the Conference. As American delegates Mr. Harding designated Secretary of State Hughes, Elihu Root, Senators Lodge and Underwood; the British Empire was represented by Mr. Balfour (as he then was), Lord Lee of Fareham, Sir Auckland Geddes and Sir Robert L. Borden, as principal delegates; France by M. Briand, M. Viviani, M. Sarraut and M. Jusserand; Italy by Signor Schanzer and Signor Ricci; Japan by Prince Tokugawa, Admiral Kato and Ambassador Shidehara; China by Mr. Wellington Koo and Mr. Sze. The conference assembled on Nov. 12, 1921, was addressed by Mr. Harding, and elected Mr. Hughes as its chairman. The latter at once placed the American proposals on naval disarmament before the gathering. Mr. Hughes proposed that there should be a naval "holiday": "for a period of not less than 10 years there shall be no further construction of capital ships." He then presented a definite plan for the scrapping of certain of the older capital ships and of capital ships under construction, and the restriction of capital ship replacements by an agreed maximum of tonnage.

In the plenary session of Nov. 21 the subject of military armament was introduced by Mr. Hughes, but the attitude of France established the impracticability of discussing any definite plan for the limitation of armies. A sub-committee was appointed, however, to consider the question of aircraft, poison gases and the rules for the conduct of war.

The agenda of the conference were dealt with by two committees of the whole, one composed of the delegates of the five principal Powers to deal with limitation of armament, the other composed of delegates of all nine Powers to deal with matters affecting the Pacific and the Far East.

Meetings of these committees and their sub-committees were not open to the public; their results were reported formally at the

open plenary sessions, of which six were held. The decisions reached were in regard to navies, including submarines; poison gases; the Pacific Ocean and its islands; and Chinese affairs.

The Question of Capital Ships.—The committee on armament discussed fully the maximum tonnage and ratio of capital ships to which each Power should restrict itself; and on Dec. 20 a provisional agreement was reached. Japan maintained (Dec. 20) that 60% of the quota proposed for the United States and Great Britain was insufficient for her defensive needs, and asked that it be increased to 70%; her delegates were especially unwilling to sacrifice the "Mutsu," a new capital ship (in large measure paid for by popular subscription), which, under the Hughes plan, would have to be scrapped. This obstacle was overcome by permitting Japan to retain the "Mutsu," on condition that an older ship, the "Setsu," should be scrapped. This change gave Japan two post-Jutland ships and an increased capital ship tonnage, to offset which it was agreed that the United States should complete two ships still in process of construction, and that Great Britain should construct two new vessels not to exceed 35,000 tons each. In replacement tonnage the ratio was to stand thus: United States and Great Britain 525,000 tons each and Japan 315,000 tons—a ratio of 5–5–3. This agreement was stated to be contingent upon a suitable arrangement for France and Italy, who had been offered a replacement tonnage of 175,000 each. But M. Sarraut, representing France, held out for an aggregate of 350,000 tons, to be constructed on a replacement basis from 1925 onwards. The controversy was finally laid before M. Briand, who had returned to France; he agreed to accept for France the maximum of 175,000 for capital ships, but made his consent conditional on the obtaining of a larger proportion of auxiliary craft and submarines, which were regarded by France as purely defensive weapons.

The Question of Submarines.—The French reply settled the problem of capital ships, but a warm controversy was provoked over submarines. Mr. Balfour proposed their complete abolition. Mr. Hughes proposed a reduction of submarine tonnage for the United States and Great Britain to 60,000 apiece, and approximately the *status quo* for France, Japan and Italy (31,500 for the first two, 21,000 tons for the last). But the French delegates refused to accept less than 90,000 tons for submarines and 330,000 for cruisers and auxiliary craft. Mr. Balfour then made it plain that, failing action against the submarine itself, Great Britain could accept no limitation for anti-submarine craft.

As a result, the treaty, as finally agreed upon by the five major Powers, did not include limitation of total tonnage of submarine or auxiliary craft. Limits, however, were placed upon the total tonnage of aircraft carriers and upon individual tonnage of capital ships and cruisers, as well as upon the calibre of guns carried.

The failure of the British attempt to abolish the submarine was mitigated by the passage of a series of resolutions presented by Mr. Root and later embodied in a treaty. As accepted, they stated the rules of international law as to "visit and search" on the high seas, and declared that belligerent submarines are not exempt from these rules. They invited the adherence of all civilised Powers to this statement. In the third place, they recognised that the use of submarines as commerce destroyers was practically impossible without violation of these rules, and that prohibition of such use should be accepted as a law of nations; they declared the assent of the contracting Powers to such prohibition, and invited that of all other nations. No definition of a merchant ship was adopted. In the fourth place, they declared that commanders of all ships transgressing international rules should be subject to punishment for piracy. Aircraft limitation was rejected by the conference, after a technical report of the subcommittee had declared limitation to be impracticable, but an inquiry commission was appointed. The abolition of the use of poison gas in international warfare, on the other hand, was advocated by the Naval Committee Jan. 7 1922, on the motion of Mr. Hughes, and prohibition of poison gas was embodied in a treaty.

Problems of the Pacific.—In respect of the problems of the Pacific a new treaty was drafted and presented at the plenary session, Dec. 10 1921, between the United States, Great Britain, France and Japan. It pledged each to respect the rights of the others in relation to their insular possessions and insular dominions in the Pacific, to accept mediation in case of controversy over these possessions and to open frank discussions if their rights were threatened by any other Power. The treaty was to remain in force for 10 years, and upon its ratification the Anglo-Japanese Alliance was automatically to be terminated. A reservation accompanied the treaty embodying provisions to the effect that it should not be deemed an assent on the part of the United States to "mandates" granted in the Pacific under the Peace Treaty of Versailles, and should not preclude agreements relative to mandated islands. (*See* SINGAPORE.)

The reservation also excepted from arbitrable controversies questions lying within domestic jurisdiction of the contracting Powers. To the treaty was later appended a second agreement, defining the phrase "insular possessions and insular dominions" in such a way as to exclude Japan proper from its scope. The representatives of the United States and Japan also signed a treaty regarding Yap, according to which the United States was to have free access there on a footing of entire equality with Japan in all that related to cable and radio service, and received certain privileges and exemptions in relation to electrical communications. Subject to various conditions the United States consented to the administration by Japan of the mandated islands in the Pacific north of the equator.

Attitude Towards China.—Chinese problems were presented (Nov. 16 1921), by Mr. Sze in the form of 10 points, which the conference was asked to adopt. (*See* CHINA.) They called for recognition of the territorial integrity and political and administrative independence of China, the "open door" neutrality and the complete removal of all political, jurisdictional and administrative restrictions upon the Chinese Republic. The general attitude of the conference towards China was crystallised (Nov. 21) when four resolutions presented by Mr. Root were adopted. They declared the intention of the Powers to respect the sovereignty, the independence and the territorial and administrative integrity of China, their desire to maintain the principle of equal opportunity for the commerce and industry of all nations and their agreement not to seek special rights or privileges. Details of specific arrangements to be enforced led to long discussions. A resolution was adopted (Dec. 24) providing for the voluntary withdrawal of foreign post-offices from China Jan. 1 1923, on condition that China should maintain efficient service and continue the supervision of the foreign co-director-general. The problem of extraterritorial rights could not be settled definitely, but it was referred to an international committee for intensive study and report within a year. The demand for the withdrawal of foreign troops from China was referred to a sub-committee, and finally it was agreed that, while the principle of withdrawal was accepted, the issues raised should be made the subject of inquiry, in order to determine the conditions upon which withdrawal must depend.

On the other hand, the Powers passed a resolution urging China to reduce the large military forces maintained by the military governors. The relinquishment of foreign leaseholds in China was not actually secured (though Great Britain announced her readiness in this respect if other countries would join her); but China's fight for "open diplomacy" was virtually won when a resolution was passed (Dec. 8) pledging the nine Powers not to enter into any agreement that might impair the force of the four Root resolutions. As regards the customs tariffs, the demand of China for complete autonomy was not granted, nor the request made, in view of the nation's financial necessities, that her quota be raised from 5% to 12½%. It was decided, however, that China's customs revenue should be increased by $46,000,000 silver annually, through an advance to 5% effective, a surtax of 2½% and a surtax not exceeding 5% on luxuries. The treaty provided for the convening of a Tariff Revision Commission at Shanghai, the opening of which was delayed until Oct. 1925, owing to the internal troubles of China. Other resolutions included agreements that foreign radio stations should transmit

only Government messages, that there should be no unfair discrimination in railway rates, an expression of hope that the railway system might be unified under Chinese Government control, and an agreement for the establishment of a board of reference for Far Eastern questions.

Shantung.—The question of the Japanese occupation of Shantung entailed long negotiations which at times seemed to reach a dead-lock, especially those relating to the Tsingtao-Tsinan-fu Railway. Largely through the mediation of Mr. Hughes and Mr. Balfour, a separate agreement was finally reached between Japan and China and signed Feb. 4. It provided for the return to China of the former German leasehold and 50-km. zone in Shantung, and the withdrawal of Japanese troops and gendarmes; China was to purchase the Tsinan-fu Railway for $30,000,000, but, before complete redemption, there were to be appointed a Japanese traffic manager subject to the direction of the Chinese managing director, a Japanese accountant and a Chinese accountant of equal rank. Japan renounced all rights to foreign assistance stipulated in the Chinese-German Treaty of 1898, and relinquished the maritime customs at Tsingtao and former German public properties. As to Siberian problems, Baron Shidehara made a full statement to the effect that it was "the fixed and settled policy" of Japan to respect the territorial integrity of Russia.

The Treaties.—The decisions taken by the conference were embodied in seven treaties and various supplementary resolutions. For particulars regarding the terms of the *Five-Power Treaty Limiting Naval Armaments see* WASHINGTON TREATY.

By June 9 1923, all the signatory Powers except France had ratified the Five-Power Treaty in relation to the use of Submarines and Noxious Gases in Warfare, the Nine-Power Treaty relating to Principles and Policies to be followed in Matters concerning China, and the Nine-Power Treaty relating to Chinese Customs Tariff. France ratified the last two on July 20 1925, but had not, up to Apr. 1929, ratified the treaty in relation to the use of Submarines and Noxious Gases, apparently because of its objection to the provision on the use of submarines and not because of the restrictions upon the use of poison gases. The French Government ratified the Geneva Poison Gas Protocol of June 1925. By July 28, 1923, all the signatory Powers had ratified the Five-Power Treaty limiting Naval Armaments; also the Four-Power Treaty relating to Insular Possessions and Insular Dominions in the Pacific Ocean, the Declaration accompanying this treaty, and the treaty supplementary thereto.

Norway adhered on Sept. 23 1925, to the treaty relating to Chinese Customs Tariff; and on Nov. 13 1925, to the treaty relating to Principles and Policies concerning China. Denmark and Sweden signified their adherence to the treaty relating to Chinese Customs Tariff on Aug. 27 1925 and Sept. 11 1925.

WASHINGTON COURT HOUSE, a city of Ohio, U.S.A., the county seat of Fayette county; on Paint creek, 40 m. S.W. of Columbus, at an altitude of 970 feet. Pop. (1920) 7,962. The city was laid out in 1810 and chartered in 1888.

WASHINGTONIA, in botany, a genus of the palm family (Palmae), named in honour of George Washington, comprising three handsome species, natives of southern California, Arizona and adjacent Mexico.

WASHINGTON TREATY (LIMITATION OF NAVAL ARMAMENTS). A treaty for the limitation of naval armaments was concluded at Washington, U.S.A., on Feb. 6, 1922. The contracting parties were the United States of America, the British empire, France, Italy and Japan.

Provisions of the Treaty.—The following are the essentials of the agreement come to under the treaty.

(1.) The Contracting Powers agree to limit their respective naval armament as provided in the treaty.

(2.) The Contracting Powers may retain respectively the capital ships specified in the treaty; all other capital ships, built or building, of the United States, the British empire and Japan to be disposed of.

(3.) Subject to the foregoing, the Contracting Powers abandon their respective capital ship building programmes, and no new capital ships shall be constructed or acquired by any of them except replacement tonnage as specified below. Ships replaced shall be disposed of.

(4.) The total capital ship replacement tonnage of each of the Contracting Powers shall not exceed in standard displacement, for the United States, 525,000 tons; for the British empire, 525,000 tons; for France, 175,000 tons; for Italy, 175,000 tons; for Japan, 315,000 tons.

(5.) No capital ship exceeding 35,000 tons' standard displacement shall be acquired by, or constructed by, for, or within the jurisdiction of, any of the Contracting Powers.

(6.) No capital ship of any of the Contracting Powers shall carry a gun with a calibre in excess of 16 inches.

(7.) The total tonnage for aircraft carriers of each of the Contracting Powers shall not exceed in standard displacement, for the United States, 135,000 tons; for the British empire, 135,000 tons; for France, 60,000 tons; for Italy, 60,000 tons; for Japan, 81,000 tons.

(8.) The replacement of aircraft carriers shall be effected only as prescribed below, provided, however, that all aircraft carrier tonnage in existence or building on Nov. 12, 1921, shall be considered experimental, and may be replaced, within the total tonnage limit prescribed above without regard to its age.

(9.) No aircraft carrier exceeding 27,000 tons' standard displacement shall be acquired by, or constructed by, for or within the jurisdiction of, any of the Contracting Powers. However, any of the Contracting Powers may, provided that its total tonnage allowance of aircraft carriers is not thereby exceeded, build not more than two aircraft carriers, each of a tonnage of not more than 33,000 tons' standard displacement, and in order to effect economy any of the Contracting Powers may use for this purpose any two of their ships, whether constructed or in course of construction, which would otherwise be scrapped. The armament of any aircraft carriers exceeding 27,000 tons' standard displacement shall be in accordance with the requirements stated below, except that the total number of guns to be carried in case any of such guns be of a calibre exceeding 6 in., except anti-aircraft guns and guns not exceeding 5 in., shall not exceed eight.

(10.) No aircraft carrier of any of the Contracting Powers shall carry a gun with a calibre in excess of 8 inches. Without prejudice to the foregoing provisions, if the armament carried includes guns exceeding 6 in. in calibre the total number of guns carried, except anti-aircraft guns and guns not exceeding 5 in., shall not exceed 10. If alternatively the armament contains no guns exceeding 6 in. in calibre, the number of guns is not limited. In either case the number of anti-aircraft guns and of guns not exceeding 5 in. is not limited.

(11.) No vessel of war exceeding 10,000 tons' standard displacement, other than a capital ship or aircraft carrier, shall be acquired by, or constructed by, for, or within the jurisdiction of, any of the Contracting Powers. Vessels not specifically built as fighting ships nor taken in time of peace under Government control for fighting purposes, which are employed on fleet duties or as troop transports or in some other way for the purpose of assisting in the prosecution of hostilities otherwise than as fighting ships, shall not be subject to this limitation.

(12.) No vessel of war of any of the Contracting Powers, hereafter laid down, other than a capital ship, shall carry a gun with a calibre in excess of 8 inches.

(13.) Except as provided in Article IX., no ship designated in the treaty to be scrapped may be reconverted into a vessel of war.

(14.) No preparations shall be made in merchant ships in time of peace for the installation of warlike armaments for the purpose of converting such ships into vessels of war, other than the necessary stiffening of decks for the mounting of guns not exceeding 6-in. calibre.

(15.) No vessel of war constructed within the jurisdiction of any of the Contracting Powers for a non-Contracting Power shall exceed the limitations as to displacement and armament prescribed by the treaty for vessels of a similar type which may be constructed by or for any of the Contracting Powers; provided, however, that the displacement for aircraft carriers constructed for a non-Contracting Power shall in no case exceed 27,000 tons' standard displacement.

(16.) If the construction of any vessel of war for a non-Contracting Power is undertaken within the jurisdiction of any of the Contracting Powers, such Power shall promptly inform the other Contracting Powers of the date of the signing of the contract and the date on which the keel of the ship is laid; and shall also communicate to them particulars of the ship.

(17.) In the event of a Contracting Power being engaged in war, such Power shall not use as a vessel of war any vessel of war which may be under construction within its jurisdiction for any other Power, or which may have been constructed within its jurisdiction for another Power and not delivered.

(18.) Each of the Contracting Powers undertakes not to dispose by gift, sale or any mode of transfer of any vessel of war in such a manner that such vessel may become a vessel of war in the navy of any foreign Power.

(19.) The United States, the British empire and Japan agree that the *status quo* at the time of the signing of the treaty, with regard to fortifications and naval bases, shall be maintained in their respective territories and possessions specified hereunder:—

1. The insular possessions which the United States now holds or may hereafter acquire in the Pacific ocean, except (*a*) those adjacent to the coast of the United States, Alaska and the Panama Canal Zone, not including the Aleutian islands, and (*b*) the Hawaiian islands;

2. Hong Kong and the insular possessions which the British empire now holds or may hereafter acquire in the Pacific ocean, east of the meridian of 110° east longitude, except (*a*) those adjacent to the coast of Canada, (*b*) the Commonwealth of Australia and its territories and (*c*) New Zealand;

3. The following insular territories and possessions of Japan in the Pacific ocean, to wit: the Kurile islands, the Bonin islands, Amami-Oshima, the Loochoo islands, Formosa and the Pescadores, and any insular territories or possessions in the Pacific ocean which Japan may hereafter acquire.

The maintenance of the *status quo* under the foregoing provisions implies that no new fortifications or naval bases shall be established in the territories and possessions specified; that no measures shall be taken to increase the existing naval facilities for the repair and maintenance of naval forces, and that no increase shall be made in the coast defences of the territories and possessions above specified. This restriction, however, does not preclude such repair and replacement of worn-out weapons and equipment as is customary in time of peace.

Replacement.—The replacement of capital ships and aircraft carriers shall take place according to the following rules.

(1.) Capital ships and aircraft carriers 20 years after the date of their completion may, except as otherwise provided, be replaced by new construction, but within the limits prescribed in Article IV. and Article VII. The keels of such new construction may, except as otherwise provided, be laid down not earlier than 17 years from the date of completion of the tonnage to be replaced, provided, however, that no capital ship tonnage, with the exception of ships specified in the treaty, shall be laid down until ten years from Nov. 12, 1921.

(2.) Each of the Contracting Powers shall communicate promptly to the others the following information:

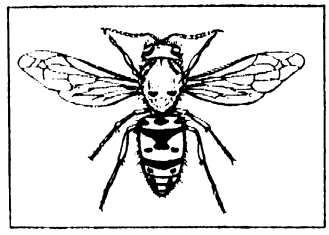
(*a*) The names of the capital ships and aircraft carriers to be replaced by new construction; (*b*) the date of governmental authorization of replacement tonnage; (*c*) the date of laying the keels of replacement tonnage; (*d*) the standard displacement in tons and metric tons of each new ship to be laid down, and the principal dimensions, namely, length at waterline, extreme beam at or below waterline, mean draft at standard displacement; (*e*) the date of completion of each new ship and its standard displacement in tons and metric tons, and the principal dimensions.

(3.) In the case of loss or accidental destruction of capital ships or aircraft carriers, they may immediately be replaced by new construction subject to the tonnage limits prescribed in Articles IV. and VII. and in conformity with the other provisions of the treaty, the regular replacement programme being deemed to be advanced to that extent.

(4.) No retained capital ships or aircraft carriers shall be reconstructed except for the purpose of providing means of defence against air and submarine attack, and subject to the following rules: The Contracting Powers may, for that purpose, equip existing tonnage with bulge or blister or anti-air-attack deck protection, providing the increase of displacement thus effected does not exceed 3,000 tons' displacement for each ship. No alterations in side armour, in calibre, number or general type of mounting of main armament shall be permitted except: (*a*) In the case of France and Italy, which countries within the limits allowed for bulge may increase their armour protection and the calibre of the guns carried on their existing capital ships so as not to exceed 16 in. and (*b*) the British empire shall be permitted to complete, in the case of the "Renown," the alterations to armour that have already been commenced but temporarily suspended.

Definitions.—For the purpose of the treaty, a capital ship, in the case of ships hereafter built, is defined as a vessel of war, not an aircraft carrier, whose displacement exceeds 10,000 tons' standard displacement, or which carries a gun with a calibre exceeding 8 inches.

An aircraft carrier is defined as a vessel of war with a displacement in excess of 10,000 tons' standard displacement, designed for the specific and exclusive purpose of carrying aircraft. It must be so constructed that aircraft can be launched therefrom and landed thereon, and not designed and constructed for carrying a more powerful armament than that allowed to it under Article IX. or Article X. as the case may be.



The standard displacement of a ship is the displacement of the ship complete, fully manned, engined, and equipped ready for sea, including all armament and ammunition, equipment, outfit, provisions and fresh water for crew, miscellaneous stores and implements of every description that are intended to be carried in war, but without fuel or reserve feed water on board.

Miscellaneous Provisions.—If during the term of the treaty the requirements of the national security of any Contracting Power in respect of naval defence are, in the opinion of that Power, materially affected by any change of circumstances, the Contracting Powers will, at the request of such Power, meet in conference with a view to the reconsideration of the provisions of the treaty and its amendment by mutual agreement.

In view of possible technical and scientific developments, the United States, after consultation with the other Contracting Powers, shall arrange for a conference of all the Contracting Powers which shall convene as soon as possible after the expiration of eight years from the coming into force of the present treaty to consider what changes, if any, in the treaty may be necessary

to meet such developments.

Whenever any Contracting Power shall become engaged in a war which in its opinion affects the naval defence of its national security, such Power may after notice to the other Contracting Powers suspend for the period of hostilities its obligations under the present treaty other than those under Articles XIII. and XVII., provided that such Power shall notify the other Contracting Powers that the emergency is of such a character as to require such suspension. The remaining Contracting Powers shall in such case consult together with a view to agreement as to what temporary modifications, if any, should be made in the treaty as between themselves. Should such consultation not produce agreement, duly made in accordance with the constitutional methods of the respective Powers, any one of the said Contracting Powers may, by giving notice to the other Contracting Powers, suspend for the period of hostilities its obligations under the present treaty, other than those under Articles XIII. and XVII. On the cessation of hostilities the Contracting Powers will meet in conference to consider what modifications, if any, should be made in the provisions of the present treaty.

BY COURTESY OF H.M. STATIONERY OFFICE AND THE MINISTRY OF AGRICULTURE AND FISHERIES

FIG. 1.—WASP (VESPA RUFA), ONE OF THE SEVEN SPECIES MET WITH IN BRITAIN

The present treaty shall remain in force until Dec. 31, 1936, and in case none of the Contracting Powers shall have given notice two years before that date of its intention to terminate the treaty, it shall continue in force until the expiration of two years from the date on which notice of termination shall be given by one of the Contracting Powers, whereupon the treaty shall terminate as regards all the Contracting Powers. Within one year of the date on which a notice of termination by any Power has taken effect, all the Contracting Powers shall meet in conference.

The present treaty remains deposited in the archives of the Government of the United States, and duly certified copies thereof have been transmitted to the other Contracting Powers.

WASP, the ordinary name for a well-known kind of stinging insect belonging to the order Hymenoptera (*q.v.*). At least 10,000 species of wasps are known and unlike bees, they are primarily predacious in habit, feeding their young mainly upon other insects. They form two great groups, Sphecoidea and Vespoidea, with the vast majority of the species solitary in habit. Most of these solitary kinds are known as fossorial or digging wasps, from the fact that so many of them make receptacles for their young by excavating burrows in the ground or tunneling in wood or in stems of plants. The true wasps form a separate section of the Vespoidea and were formerly grouped into a single division—the Diploptera, in allusion to the fact that the fore wings are longitudinally folded when at rest. They are further distinguished from other wasps by the posterior lateral angles of the pronotum, which end above the tegulae. They include three families, one of which, the Vespidae, consists of social species and includes the wasps most familiar to the ordinary observer: for these *see* SOCIAL INSECTS. The Eumenidae are solitary wasps and the best-known genera are *Eumenes* and *Odynerus*. These insects have the curious habit of suspending their eggs by slender threads from the roofs of the cells in which they are laid. Each cell is commonly provisioned with several caterpillars previously paralysed by stinging. In *Eumenes* the abdomen is joined to the thorax by a slender petiole or stalk: they are potter wasps making neat vase-like cells attached to stems or other objects. In *Odynerus* the petiole is wanting and the cells are made on walls, in wood, or in the ground; some species utilize key holes or even deserted cells of other wasps. Both genera occur in Great Britain and North America. The third family, or Masaridae, is chiefly tropical and remarkable because its cells are provisioned with a paste of honey and pollen. The species are all solitary and have the wings either incapable of being folded or imperfectly plicate.

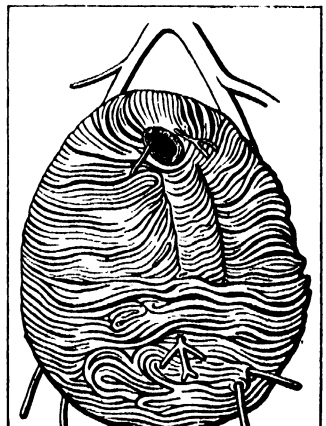


FIG. 2.—NEST OF THE TREE WASP, (VESPA SYLVESTRIS)

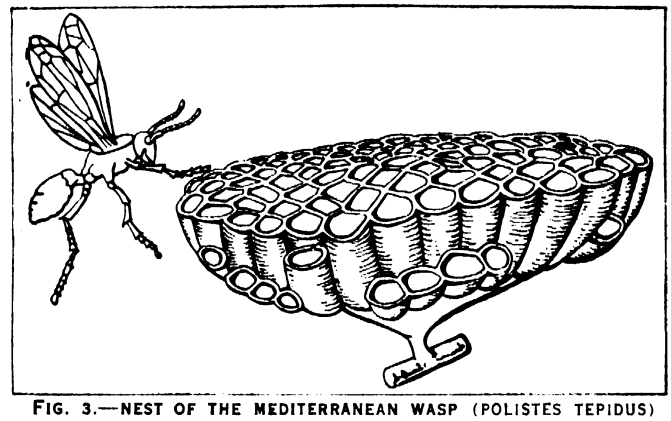

FIG. 3.—NEST OF THE MEDITERRANEAN WASP (POLISTES TEPIDUS)

See E. Saunders, *Hymenoptera Aculeata of the British Islands* (1896); P. and N. Rau, *Wasp Studies Afield* (Princeton, N.J., 1918); G. W. and E. G. Peckham, *Wasps, Solitary and Social* (Boston and New York, 1905); E. Berland, "Hymenoptères Vespiformes," *Faune de France*, vol. x. (1925). (A. D. I.)

WASSAIL, the ancient form of "toasting" (O.E. *waes hál*, "be whole"), the term being applied later to the Christmas feasting and revelries and particularly to the bowl of spiced ale or wine which was a feature of the mediaeval Christmas. At the reception of King Vortigern by Hengist, Rowena "came into the king's presence, with a cup of gold filled with wine in her hand, and making a low reverence unto the king said, 'Waes hael hlaford Cyning,' which is 'Be of health, Lord King.'" In Henry VII.'s reign the steward on Twelfth Night cried "wassail" three times on entering with the bowl. Wassailing was as much a custom in the monasteries as in laymen's houses, the bowl being known as *poculum Caritatis*.

WASSERMANN, AUGUST VON (1866–1925), German professor of medicine, was born Feb. 21, 1866, at Bamberg, in Bavaria. He studied in Erlangen, Munich, Strasbourg and Vienna, and in 1888 began to practise as a physician in Strasbourg. He was then engaged as an assistant to the Robert Koch institute for Infectious Diseases, Berlin, where, from 1906, he directed the department of experimental therapy and serum research. In 1913 he became director of the Kaiser Wilhelm institute in Berlin-Dahlem. Wassermann achieved international fame by his discovery (1907) of sero-diagnosis in syphilis—the so-called Wassermann Reaction—which enables both past infection and the activity of the process of the disease to be ascertained. He died in Berlin on March 15, 1925.

His works include "Allgemeine Einleitung zur Lehre von den Infektionskrankheiten" in Ebstein and Schwalbe's *Handbuch der praktischen medegia: Influenza, Immunität und Serumtherapie* and *Hämolysine, Zytotoxine und Präzipitine* (1910).

WASSERMANN REACTION. The Wassermann, or, perhaps more correctly, the Bordet-Wassermann test of the blood serum and of the spinal fluid for active syphilis was elaborated in 1906 by Wassermann, Neisser and Bruck. It depends on the fact well-known to bacteriologists that foreign organic substances, *e.g.*, disease germs in the body, stimulate the formation of compounds (which appear in the blood) designed to destroy the foreign organic substances or germs (*see* IMMUNITY). These anti-bodies effect their purpose with the aid of a substance present in practically all blood sera and known as complement. Bordet and Gengou, by devising a simple test for complement, showed that,

in the process, complement was put out of action.

Wassermann, Neisser and Bruck adapted the Bordet-Gengou phenomenon to the purpose of detecting anti-syphilitic substance in the blood serum. They found that, in a mixture of (a) extract of liver of an infant dead of syphilis (which they regarded as extract of the germs of syphilis—*Spirochaeta pallida*—with which the liver was stuffed), (b) fresh serum of a guinea-pig—complement—, and (c) serum (previously heated to destroy its natural complement) of a syphilitic person, the complement was put out of action, and that this did not occur when serum of a normal person was substituted for that of a syphilitic. Thus they demonstrated, as they thought, anti-spirochaeta-pallida substance in the blood of the syphilitic person and inferred from this that a similar phenomenon in any serum would prove syphilitic infection.

Later discoveries showed that extract of such an organ as normal heart of any animal would serve in the test as well as syphilitic liver, and it is now believed that the test does not discover anti-spirochaeta-pallida substances, but anti-bodies to tissue cells which have degenerated in consequence of the action of *Sp. pallida* and act as foreign organic substances. The reliability of the test can best be described in the words of a committee of the Medical Research Council as follows:

> There is no process of biochemical diagnosis that gives more trustworthy information or is liable to a smaller margin of error than the Wassermann test when it is performed with completeness and with proper skill and care.

The percentages of cases of syphilis which give positive reactions to the Wassermann test vary with different pathologists, who have modified the original technique considerably—in the preparation of the extract, the proportions of the different reagents to one another and the periods during which they are allowed to interact, but broadly the reaction is negative for the first fortnight after appearance of the primary syphilitic lesion, and is positive in almost 100 per cent of cases by the end of a month or six weeks. In older cases with outward signs of active syphilis the percentage is almost as high, but in those with no obvious signs (latent syphilis) it is rather lower. Treatment in the early stages usually converts the reaction to negative in a few weeks, but in later stages a persistently positive reaction is very common. A negative reaction does not prove cure or absence of the disease, and suspension of treatment when the reaction first disappears is commonly followed by relapse, a fact which the general public often does not realise. The reaction may be negative in the blood serum but positive in the spinal fluid, and vice versa.

Other Serum Tests for Syphilis.—The great complexity of the Wassermann test has stimulated research to discover a simpler, and there are now a number, of which the chief are the Sachs-Georgi, the Meinicke, the Sigma, the Vernes and the Kahn. They differ considerably in technique and quality, but all depend on the fact that, when a syphilitic serum is brought into contact with an extract of heart, flocculi appear sooner or later in the mixture, or it becomes more turbid. The reliability of these flocculation tests and their value in comparison with one another are not yet decided, but the better of them are practically as reliable as the Wassermann and give higher percentages of positive reactions in syphilis. Since, however, a syphilitic serum may give a positive reaction to the Wassermann but negative to a flocculation test, and vice versa, it is now a common practice to test every specimen of serum by the Wassermann and by one or more of the flocculation methods. (L. W. H.)

WASTE, a term used in English law in several senses, of which four are the most important. (1) "Waste of a manor" is that part of a manor subject to rights of common, as distinguished from the lord's demesne (*see* COMMONS, MANOR). (2) "Year, day, and waste" was a part of the royal prerogative, acknowledged by a statute of Edward II., *De Prærogativa Regis*. The king had the profits of freehold lands of those attainted of felony and petit treason, and of fugitives, for a year and a day with a right of committing waste in sense (3) thereon. After the expiration of a year and a day the lands returned to the lord of the fee. This species of waste was abolished by the Corruption of Blood Act 1814 (*see* FELONY, TREASON). (3) The most usual signification of the word is "any unauthorized act of a tenant, for a freehold estate not of inheritance, or for any lesser interest, which substantially alters the permanent character of the thing demised (i.) by diminishing its value, (ii.) by increasing the burden on it, (iii.) by impairing the evidence of title and thereby injuring the "inheritance" (*West Ham Charity Board* v. *East London W.W.*, 1900, 1 Ch. 624, 637; *cf.* Pollock on *Torts*, 357).

Waste in sense (3) is either *voluntary* or *permissive*. Voluntary waste is by act of commission, as by pulling down a house, wrongfully removing fixtures (*q.v.*), cutting down timber trees, *i.e.*, oak, ash, elm, 20 years old, and such other trees, *e.g.*, beech, as by special custom are counted timber in the district, opening new quarries or mines (but not continuing the working of existing ones), or doing anything which may—for this is the modern test—alter the nature of the thing demised, such as conversion of arable into meadow land. Although an act may technically be waste, it will not as a rule constitute actionable waste, or be restrained by injunction, in the absence of some prohibitive stipulation if it is "ameliorating," *i.e.*, if it improves the value of the land demised (see *Meux* v. *Cobley*, 1892, 2 Ch. 253, 263). In the case of "timber estates" upon which trees of various kinds are cultivated solely for their produce and the profit gained from their periodical felling and cutting, the timber is not considered as part of the inheritance but as the annual fruits of the estate, and an exception arises in favour of the tenant for life (see *Dashwood* v. *Magniac*, 1891, 3 Ch. 306). Under the Settled Land Act 1925, a tenant for life may grant building, mining, forestry and other leases for the prescribed terms "for any purpose whatever, whether involving waste or not" (s. 41) and is also protected as regards waste, in the execution and repair of improvements (s. 89). *Permissive* waste is by act of omission, such as allowing buildings to fall out of repair. A "fermor"—a term which here includes "all who held by lease for life or lives, or for years by deed or without deed" by the statute of Marlborough (1267)—may not commit waste without licence in writing from the reversioner.

Acts of equitable waste were, before 1875, not cognizable in courts of common law. However, by the provisions of the Law of Property Act 1925 (s. 135) an equitable interest for life without impeachment of waste does not confer upon the tenant for life any right to commit equitable waste, unless an intention to confer such right expressly appears in the instrument creating the equitable interest. A copy-holder may not commit waste unless allowed to do so by the custom of the manor. The penalty for waste is forfeiture of the copy-hold; *Galbraith* v. *Poynton*, 1905, 2 K.B. 258 (*see* COPY-HOLD). The Agricultural Holdings Act 1923, by reason of provisions giving compensation for improvement as regards the holdings to which it applies, overrides some of the old common law doctrines as to waste.

(4) "Waste of assets" or *"devastavit"* is a squandering and misapplication of the estate and effects of a deceased person by his executors or administrators (*see* EXECUTORS AND ADMINISTRATORS, and Administration of Estates Act 1925, s. 29). Executors and administrators may now be sued in the county court for waste of assets (County Courts Act 1888, s. 95).

Remedies for Waste.—The landlord is entitled to compensation for deterioration in the value of a holding by the failure of the tenant to cultivate according to the rules of good husbandry or the contract of tenancy (s. 10). *See* also Landlord and Tenant Act 1927 (s. 11). Proceedings may be taken either by action for damages, or by application for an injunction, or by both combined, and either in the king's bench or in the chancery divisions. *See* Supreme Court of Judicature (Consolidation) Act 1925, s. 45.

The law of waste as it affects ecclesiastical benefices will be found under DILAPIDATIONS.

Scotland.—In Scots law "waste" is not used as a technical term, but the respective rights of fiar and life-renter are much the same as in England. As a general rule, a life-renter has no right to cut timber, even though planted by himself. An exception is admitted in the case of coppice wood, which is cut at regular intervals and allowed to grow again from the roots. Grown timber is also available to the life-renter for the purpose of keeping up the estate or repairing buildings. Before making use of mature

timber for estate purposes, the life-renter should give notice to the fiar. He is also entitled to the benefit of ordinary windfalls. Extraordinary windfalls are treated as grown timber. Life-renters by "constitution" (*i.e.*, by grant from the proprietor) as opposed to life-renters by "reservation" (where the proprietor has reserved the life-rent to himself in conveying the fee to another) have, as a rule, no right to coals or minerals underground if they are not expressed in the grant or appear to have been intended by a testator to pass by his settlement, for they are *partes soli*. Where coals or minerals are expressed in the grant, and also in cases of life-rent by "reservation," the life-renter may work any mine which had been opened before the beginning of his right, provided he does not employ a greater number of miners, or bring up a greater quantity of minerals, than the unburdened proprietor did. All life-renters are entitled to such minerals as are required for domestic use and estate purposes.

British Possessions.—French law (u. i.) is in force in Mauritius, and has been followed in substance in the civil codes of Quebec (art. 455) and St. Lucia (art. 406). In most of the other colonies the rules of English law are followed, and in many of them there has been legislation on the lines of the English Settled Land Acts. In India the law as to waste is included to some extent in the Transfer of Property Act (No. IV. of 1882) and its amendments. Section 108 deals with the liabilities of lessees for waste, which may be varied by the terms of the lease or by local usage. The liabilities for waste of persons having under Hindu or Mohammedan law limited interests in reality depend in the main upon those laws, not on Indian statutes.

United States.—Following the general principle that the common law was applicable only in so far as it served American needs, American courts adapted the common law doctrine of waste to the requirements of a continuously expanding country. The application of the English law of waste was thus restricted to stimulate the development of the land by the tenant in possession. Good husbandry upon his part was the criterion by which the character of his acts as waste was determined. The conversion of meadow and wood land into arable land was thus permissible. In view of the quantity of land available for use by simply clearing away the timber, cutting timber for the purpose of cultivating the soil was not regarded as waste. With the disappearance of pioneer conditions, except in the far western States, a tendency toward greater stringency in the application of the doctrine of waste is apparent. This is particularly noticeable in such highly industrialized States as those of the northern Atlantic seaboard. The difference, however, lies largely in a change in the character of what good husbandry demands, rather than a change in the legal principle. The remedy for waste lies either by an action at law for damages due to waste or by an injunction to restrain further waste and to compel an accounting for the waste done. Few cases in which the old common law action for forfeiture of the tenancy because of waste are to be found in the American reports.

Europe.—The French Civil Code provides (art. 591) that the usufructuary may cut timber in plantations that are laid out for cutting, and are cut at regular intervals, although he is bound to follow the example of former proprietors as to quantity and times. This provision is in force in Belgium (Civil Code, art. 591). Analogous provisions are to be found in the civil codes of Holland (art. 814), Spain (art. 485), Italy (art. 486), and *cf.* the German Civil Code, art. 1036.

WATCHES. The word watch by derivation means that which keeps observation. It is thus the term for the body of persons who patrolled the streets, called the hours, and performed the duties of the modern police. The application of the term to a period of time is due to the military division of the night by the Greeks and Romans into watches marked by the change of sentries; similarly, on shipboard, time is also reckoned by watches, and the crew is divided into two portions, the starboard and port watches, taking duty alternately.

The invention of portable timepieces dates from the end of the 15th century, and the earliest manufacture of them was in Germany. They were originally small clocks with mainsprings enclosed in boxes; sometimes they were of a globular form and were often called "Nuremberg eggs." Being too large for the pocket they were frequently hung from the girdle. The difficulty with these early watches was the inequality of action of the mainspring. An attempt to remedy this was provided by a contrivance called the stack-freed, which was little more than a sort of rude auxiliary spring. The problem was solved about the years 1525–40 by the invention of the fusee. By this contrivance the mainspring is made to turn a barrel on which is wound a piece of catgut, which in the latter part of the 16th century was replaced by a chain. The other end of the catgut band is wound upon a spiral drum, so contrived that as the spring runs down and becomes weaker, the leverage on the axis of the spiral increases, and thus gives a stronger impulse to the works (fig. 1).

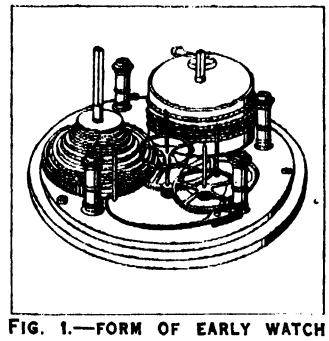

FIG. 1.—FORM OF EARLY WATCH FROM 16TH CENTURY ONWARDS, SHOWING GOING BARREL AND FUSEE

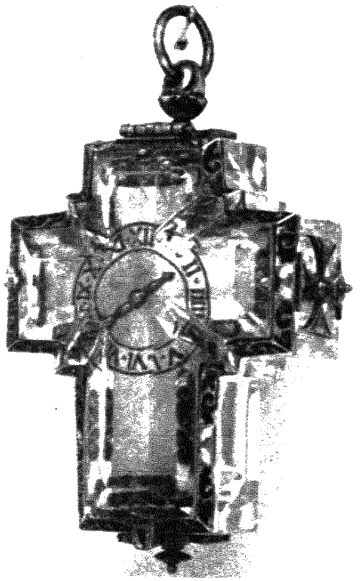
In early watches the escapement was the same as in early clocks, namely, a crown wheel and pallets with a balance ending in small weights. Such an escapement was, of course, very imperfect, for since the angular force acting on the balance does not vary with the displacement, the time of oscillation varies with the arc, and this again varies with every variation of the driving force. An immense improvement was therefore effected when the hair-spring was added to the balance, which was replaced by a wheel. This was done about the end of the 17th century. During the 18th century a series of escapements were invented to replace the old crown wheel, ending in the chronometer escapement, and though great improvements in detail have since been made, yet the watch, even as it is to-day, may be called an 18th-century invention.

The watches of the 16th century were usually enclosed in cases ornamented with the beautiful art of that period. Sometimes the case was fashioned like a skull, and the watches were made in the form of octagonal jewels, crosses, purses, little books, dogs, seashells, etc., in almost every instance being finely engraved. Queen Elizabeth was very fond of receiving presents, and a number of the gifts presented to her were jewelled watches.

The man to whom watch-making owes perhaps the most was Thomas Tompion (1639–1713), who invented the first dead-beat escapement for watches. But a defect remained, namely, the influence of temperature upon the hair-spring of the balance-wheel. Many attempts were made to provide a remedy. But the best solution of the problem was ultimately proposed by Pierre le Roy (1717–85) and perfected by Thomas Earnshaw (1749–1829). This was to diminish the inertia of the balance-wheel in proportion to the increase of temperature, by means of the unequal expansion of the metals composing the rim.



Invention in watches was greatly stimulated by the need of a good timepiece for finding longitudes at sea, and many successive rewards were offered by the Government for watches which would keep accurate time and yet be able to bear the rocking motion of a ship. The difficulty ended by the invention of the chronometer, which was so perfected towards the early part of the 19th century as to have even now undergone but little change of form. In fact the only great triumph of later years has been the invention of watch-making machinery, whereby the price is so lowered that an excellent watch (in a brass case) can now be purchased for about £2, and a really accurate timekeeper for about £18.

WATCHES, 16TH–18TH CENTURIES

1. Table watch of gilt metal, Nuremberg, Germany, 16th century, one of the earliest watches in existence. 2. Silver dome-shaped clock watch, made by Bartholomew Nusam, *c.* 1560, England. 3. Maltese cross-shaped watch of rock crystal, black and blue enamel and gilt metal, by Conrad Kreizer, *c.* 1610, Strasbourg. 4. Oval watch, Limoges enamel panels and gilt metal, movement signed by David Ramsey, *c.* 1610–25, England. 5. Hourglass-shaped watch of gold, enamel and crystal, to be set on head of walking-stick; movement signed by Jean Hubert, *c.* 1645–70, Rouen, France. 6. Engraved silver watch with original fob; movement signed by Edward East, 1640–60, London. 7. Clock watch belonging to a knight of the Order of St. Stephen. 8. Italian leather case for (7), with crimson cord and tassel

THE MODERN WATCH

A modern watch consists of a case and framework containing the four essential parts of every timepiece, namely, a mainspring and apparatus for winding it up, a train of wheels with hands and a face, an escapement and a balance-wheel and hair-spring.

The Mainspring.—As has been said, the mainspring of an old-fashioned watch was provided with a drum and fusee so as to equalize its action on the train. An arrangement was provided to prevent over-winding, consisting of a hook which, when the chain was nearly wound up, was pushed aside so as to engage a pin, and thus prevent further winding (*see* fig. 1). Another arrangement for watches without a fusee, called a Geneva stop, consists of a wheel with one tooth affixed to the barrel arbour, working into another with only four or five teeth. This allows the barrel arbour only to be turned round four or five times.

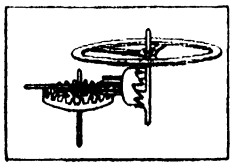

FIG. 2.—WATCH WITH EARLY CROWN WHEEL ESCAPEMENT

The going barrel, which is fitted to most modern watches, contains no fusee, but the spring is delicately made to diminish in size from one end to the other, and it is wound up for only a few turns, so that the force derived from it does not vary very substantially. The unevenness of drive is sought to be counteracted by the construction of the escapement and balance-wheel.

Watch Escapements.—The escapements that have come into practical use are—(1) the old vertical escapement, now disused; (2) the lever, very much the most common in English watches; (3) the horizontal or cylinder, which is equally common in foreign watches, though it was of English invention; (4) the duplex, which used to be more in fashion for first-rate watches than it is now; and (5) the detached or chronometer escapement, so-called because it is always used in marine chronometers.

The vertical escapement is simply the old verge adapted to the position of the wheels in a watch and the balance, in the manner exhibited in fig. 2. As it requires considerable thickness in the watch, is inferior in going to all the others and is no cheaper than the level escapement, it has gone out of use.

The lever escapement, as it is now universally made, was adopted late in the 18th century by Thomas Mudge. (Fig. 3.)

Figure 4 is a plan of the horizontal or cylinder escapement, cutting through the cylinder, which is on the verge of the balance, at the level of the tops of the teeth of the escape-wheel; the triangular pieces, A, B, are not flat projections in the same plane as the teeth, but are raised on short stems above the plane of the wheel; and still more of the cylinder than the portion shown at ACD is cut away where the wheel itself has to pass. The author of this escapement was G. Graham. The Swiss watches have almost universally the horizontal escapement. It is found that—for some reason which is apparently unknown, as the rule certainly does not hold in cases seemingly analogous—a steel scape-wheel acts better in this escapement than a brass one, although in some other cases steel upon steel, or even upon a ruby, very soon throws off a film of rust, unless they are kept well oiled, while brass and steel or stone, will act with scarcely any oil at all, or none.

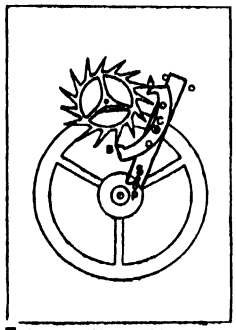

FIG. 3.—THE LEVER ESCAPEMENT

The chronometer or detached escapement is shown in fig. 5 in the form to which it was brought by Earnshaw, and in which it has remained ever since. The early history of escapements on this principle does not seem to be very clear. They appear to have originated in France; but there is no doubt that they were considerably improved by the first Arnold (John), who died in 1799. Earnshaw's watches, however, generally beat his in trials.

In fig. 5 the small tooth or cam V, on the verge of the balance, is just on the point of unlocking the detent D T from the tooth T of the scape-wheel; and the tooth A will immediately begin to give the impulse on the pallet P, which in good chronometers, is always a jewel set in the cylinder; the tooth V is also a jewel. This part of the action is so evident as to require no further notice. When the balance returns, the tooth V has to get past the end of the detent, without disturbing it; for, as soon as it has been unlocked, it falls against the banking-pin E, and is ready to receive the next tooth B, and must stay there until it is again unlocked. It ends, or rather begins, in a stiffish spring, which is screwed to the block D on the watch frame, so that it moves without any friction of pivots, like a pendulum. The passing is done by means of another spring V T, called the passing spring, which can be pushed away from the body of the detent towards the left, but not the other way without carrying the detent with it.

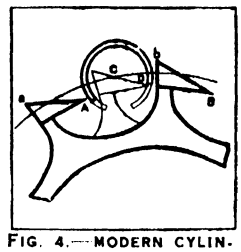

FIG. 4.—MODERN CYLINDER ESCAPEMENT

The Balance-wheel and Hair-spring.—This consists of a small wheel, usually of brass, to which is affixed a spiral, or in chronometers a helical spring. This wheel swings through an angle of from 180° to 270° and its motions are approximately isochronous. The time of the watch can be regulated by an arm to which is attached a pair of pins which embrace the hair-spring at a point near its outer end, and by the movement of which the spring can be lengthened or shortened. The first essential in a balance-wheel is that its centre of gravity should be exactly in the axis, and that the centre of gravity of the hair-spring should also be in the axis of the balance-wheel. True isochronism is disturbed by variations in the driving force of the train or by variations in temperature, and also by variations in barometric pressure. Isochronism is produced in the first place by a proper shape of the spring and its overcoil. It is usual to time the watch's going when the mainspring is partly wound up, as well as when it is fully wound up, and then by removing parts of the hair-spring to get such an adjustment that the rate is not influenced by the lesser or greater extent to which the watch has been wound. The variations in length and still more in elasticity caused in a hair-spring by changes of temperature were for long not only a trouble to watchmakers but a bar to the progress of the art. A pendulum requires scarcely any compensation except for its own elongation by heat; but a balance requires compensation, not only for its own expansion, which increases its moment of inertia just like the pendulum, but far more on account of the decrease in the strength of the spring under increased heat. E. G. Dent, in a pamphlet on compensation balances, gave the following results of some experiments with a glass balance, which he used for the purpose on account of its less expansibility than a metal one: at 32° F, 3,606 vibrations in an hour; at 66°, 3,598·5; and at 100°, 3,599. It, therefore, it had been adjusted to go right (or 3,600 times in an hour) at 32° it would have lost 7½ and 8½ seconds an hour, or more than three minutes a day, for each successive increase of 34°, which is about 15 times as much as a common wire pendulum would lose under the same increase of heat; and if a metal balance had been used instead of a glass one the difference would have been still greater.

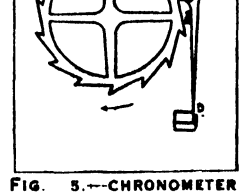

FIG. 5.—CHRONOMETER ESCAPEMENT

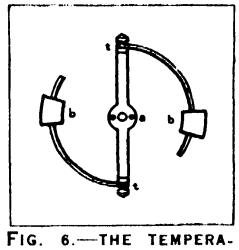
The necessity for this large amount of compensation having arisen from the variation of the elasticity of the spring, the first attempts at correcting it were by acting on the spring itself in the manner of a common regulator. Harrison's compensation consisted of a compound bar of brass and steel soldered together, having one end fixed to the watch-frame and the other carrying two curb pins which embraced the spring. As the brass expands more than the steel, any increase of heat made the bar bend; and so, if it was set the right way, it carried the pins along the spring, so as to shorten it. This contrivance is called a compensation curb; and it has often been reinvented, or applied in a modified form. But there are two objections to it: the motion of the curb pins does not correspond accurately enough to the variations

in the force of the spring, and it disturbs the isochronism, which only subsists at certain definite lengths of the spring.

Compensation Balance.—The compensation which was next invented left the spring untouched, and provided for the variations of temperature by the construction of the balance itself. Fig. 6 shows the plan of the ordinary compensation balance. Each portion of the rim of the balance is composed of an inner bar of it, and carrying the weights *b*, *b*, which are screwed to it. As the steel with an outer one of brass soldered, or rather melted, upon temperature increases, the brass expanding must bend the steel inwards, and so carries the weights farther in, and diminishes the moment of inertia of the balance, the decrease of rate being inversely as the diameter of the balance-wheel. The metals are generally soldered together by pouring melted brass round a solid steel disk, and the whole is afterwards turned and filed away till it leaves only the crossbar in the middle lying flat and the two portions of the rim standing edgeways. The first person to practise this method of uniting them appears to have been either Thomas Earnshaw or Pierre le Roy.



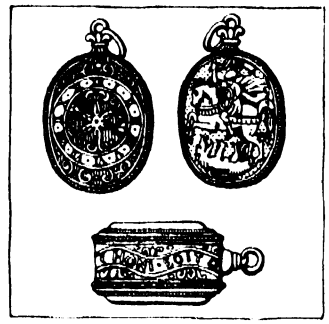


FIG. 6.—THE TEMPERATURE COMPENSATION BALANCE

The adjustment of a balance for temperature compensation can only be done by trial, and requires a good deal of time. It must be done independently of the compensation for time. It is effected by shifting the weights, because the nearer they are to the crossbar the less distance they will move over as the rim bends with them. The timing is done by screws with heavy heads (*t*,*t*, fig. 6), which are just opposite to the ends of the crossbar, and consequently not affected by the bending of the rim; other screws are also provided round the rim for adjusting the moment of inertia and centre of gravity of the balance-wheel. The compensation may be done approximately by the known results of previous experience with similar balances; and many watches are sold with compensation balances which have never been tried or adjusted, and even with a sham compensation balance, not cut through.

A few chronometers have been made with glass balance-springs, which have the advantage of requiring very little primary and no secondary compensation, on account of the very small variation in their elasticity, compared with steel or other metal.

Use of Invar.—One of the most important and interesting attempts to correct the temperature errors of a hair-spring by a series of corresponding temperature changes in the moment of inertia of the balance-wheel has been made by means of the use of the nickel-steel compound called invar, which, on account of its very small coefficient of expansion, has been of great use for pendulum rods. In a memoir published in 1904 at Geneva, Dr. Charles Guillaume, the inventor of invar, shows that in order to get a true secondary compensation what is wanted is a material having the property of causing the curve of the rim of the wheel to change at an increasing rate as compared with changes in the temperature. This is found in those specimens of invar in which the second coefficient of expansion is negative, *i.e.*, which are less dilatable at higher temperatures than at lower ones. It is satisfactory to add that such balance-wheels have been tried successfully on chronometers, and notably in a deck watch by Paul Ditisheim of Neuchâtel, who has made a chronometer with a tourbillon escapement and an invar balance-wheel, which when made held the highest record ever obtained by a watch of its class.

FIG. 7.—THE WATCH WHICH LOUIS XIII OF FRANCE PRESENTED TO CHARLES I OF ENGLAND, SHOWING OBVERSE, REVERSE AND SIDE APPEARANCE

It is obvious that in order that a watch may keep good time the centre of gravity of the balance-wheel and hair-spring must be exactly in the axis; for if this were not the case, then the wheel would act partly like a pendulum, so that the time would vary according as the watch was placed in different positions. It is exceedingly difficult to adjust a watch so that these "position errors" are eliminated. Accordingly it has been proposed to neutralize their effect by mounting the balance-wheel and hair-spring upon a revolving carriage which shall slowly rotate, so that in succession every possible position of the balance-wheel and spring is assumed, and thus errors are averaged and mutually destroy one another. This is called the tourbillon escapement. There are several forms of it, often contributing to excellent time.

Stop Watches.—Stop watches or chronographs are of several kinds. In the usual and simplest form there is a centre seconds hand which normally remains at rest, but which, when the winding handle is pressed in, is linked on to the train of the watch and begins to count seconds, usually by fifths. A second pressure arrests its path, enabling the time to be taken since the start. A third pressure almost instantaneously brings the seconds hand back to zero, this result being effected by means of a heart-shaped cam which when a lever presses on it instantaneously flies round to zero position. The number of complete revolutions of the seconds hand, *i.e.*, minutes, is recorded on a separate dial.

FIG. 8.—THE SILVER GILT SKULL WATCH OF MARY QUEEN OF SCOTS

Calendar work on watches is, of course, fatal to great accuracy of time-keeping, and is very complicated. A watch is made to record days of the week and month, and to take account of leap years usually by the aid of star-wheels with suitable pauls and stops. The type of this mechanism is to be found in the calendar motion of an ordinary grandfather's clock.

Watches have also been made containing small musical boxes and arranged with performing figures on the dials. Repeaters are striking watches which can be made at will to strike the hours and either the quarters or the minutes, by pressing a handle which winds up a striking mechanism. They were much in vogue as a means of discovering the time in the dark before the invention of lucifer matches, when to obtain a light by means of flint and steel was a troublesome affair. A very beautiful watch of this type is shown in the plate. It contains a minute barrel fitted with pins which as the barrel rotates strike or rather flip across the teeth of a minute comb. The whole thing is a marvellous specimen of hand skill. Minute work of this sort is now not much in use. It used to be thought that it ruined the eyes of the workmen. But it appears that fine work of all sorts can be done without injury to the eyes, if only proper magnifying glasses are used.

FIG. 9.—THE BOOK-SHAPED WATCH BELONGING TO BOGISLAUS XIV, DUKE OF POMERANIA BEARING THE DATE, 1627

A watch shown in the plate is an example of early 18th-century work. It has only one hand but two dials on the face. It is enclosed in a separate case as was usual with early watches. It has a crown escapement. These crown escape wheels were abandoned and replaced by the more accurate "lever." On the same plate is also shown a clock with an enamelled painted dial and a windmill with movable arms.

MODERN WATCH MAKING

From what has been said it will be seen that for many years the form of escapements and balance-wheels has not greatly altered. The great improvements which modern science has been able to effect in watches are chiefly in the use of new metals and in the employment of machinery, which, though they have altered the form but little, have effected an enormous revolution in the price. The cases of modern watches are made sometimes of steel, artificially blackened, sometimes of compounds of aluminium and

copper, known as aluminium gold. Silver is at present being less employed than formerly. The hair-springs are often of palladium in order to render the watch non-magnetizable. An ordinary watch, if the wearer goes near a dynamo, will probably become magnetized and quite useless for time-keeping. One of the simplest cures for this accident is to twirl it rapidly round while retreating from the dynamo and to continue the motion till at a considerable distance. The use of invar has been already noticed.

The forms given to watches have exercised the ingenuity of the most splendid artists. They have been enclosed in fanciful cases representing deaths' heads and all sorts of sacred emblems. They have been ornamented by movable figures and in some of them little chimes have been inserted, but the tendency of modern days is rather in favour of utility than beauty. One of the most interesting centres of watch-making is to be found at Neuchâtel in Switzerland. There on a ridge of mountains overlooking the valley is a row of watch-making factories. They are provided with water-power during the summer and in winter they use gas-engines. A large amount of the work is done by industries in the homes. The people have been watch-makers for generations. To them it is a family trade. A visit to this interesting locality would show how possible it is to unite work done with the highest scientific appliances and happy family life. Splendid schools are provided where the engineering of watch-making is thoroughly taught and inspection of the factories will show how effectively scientific engineering can be made applicable to factory work.

The use of jewelled bearings for watch pivots was introduced by Nicholas Facio about the beginning of the 18th century. Diamonds and sapphires are usually employed and pierced either by diamond drills or by drills covered with diamond dust. Rubies are not a very favourite stone for jewels, but as they and sapphires can now be made artificially for about two shillings a carat the difficulty of obtaining material for watch jewelling is met.

Watches have also been fitted with machinery whereby electric contacts are made by them at intervals, so that if wires are led to and away from them, they can be made to give electric signals and thus mark dots at regular intervals on a moving strip of paper.

Watch Testing.—As in the case of clocks, the accuracy of going of a watch is estimated by observation of the variations of its mean daily rate. In Great Britain, this is officially done at Kew Observatory, near Richmond, and also for admiralty purposes at Greenwich. At Richmond watches are divided into two classes, A and B. For an A certificate the trials last for 45 days, and include tests in temperatures varying from 40° to 90° F, going in every position with dial vertical, face up and face down. The average daily departure from the mean daily rate, that is the average error due to irregular departures from the average going rate, must not exceed 2 seconds a day except where due to position, when it may amount to 5 seconds. The error should not increase more than 0·3 second a day for each 1° F. The trial for the B certificate is somewhat similar but less severe. Chronometers are put through trials lasting 55 days, and their average error from mean rate is expected not to exceed 0·5 second per diem. The fees for these tests are various sums from two guineas downwards. In estimating the timekeeping qualities of a watch or clock, the error or rate is of secondary consequence. It is due to the time-keeper going too fast or too slow, and this can easily be corrected. What is wanted for a good watch is that the rate, whatever it is, shall be constant. The daily error is of less account provided it is a uniform daily error and not an irregular one. Hence the object of the trials is to determine not merely the daily rate but the variations of the daily rate, and on the smallness of these the value of the watch as a time-keeper depends.

Machine-made Watches.—Briefly that every part is stamped out of metal. The stamped pieces are then finished by cutters and with milling machinery. Each machine as a rule only does one operation, so that a factory will contain many hundreds of different sorts of machines. The modern watchmaker, therefore, is not so much of an art craftsman as an engineer. The effect of making all the parts of a watch by machinery is that each is interchangeable, so that one part will fit any watch. It is not an easy thing to secure this result, for as the machines are used the cutting edges wear down and require regrinding and resetting. Hence a tool is not allowed to make more than a given quantity of parts without being examined and readjusted, and from time to time the pieces being put out are tested with callipers. The parts thus made are put in groups and sorted into boxes, which are then given over to the watch-adjusters, who put the parts together and make the watch go. The work of adjustment for common watches is a simple matter. But expert adjusters select their pieces, measure them and correct errors with their tools. The finest watches are thus largely machine-made, but hand-finished. The prejudice against machine-made watches has been very strong in England, but is dying out—not before much of the trade has been lost to the country. A flourishing watch industry exists in Switzerland in the neighbourhood of Neuchâtel. A watch in a stamped steel case can now be made for about five shillings.

When one considers that watch and clock-making is capable of affording employment to thousands of artisans, that it is healthy, and above all that a considerable part of the work can be done by girls without any interruption to their home life, and again when one thinks of the millions of labourers over the world who have not got watches but who now can afford to purchase them, it seems very desirable that every effort should be made to encourage this industry. One of the wisest acts done by Voltaire was when he introduced watch-making into Switzerland, for a nation in which there are men and women trained to dexterity with the fingers, possesses an asset that may be very valuable in view of the ever increasing demand for delicate mechanisms.

Watch Imports Into United Kingdom.—The importation of watches into the United Kingdom is very large, although it was severely hit by an import duty of 33⅓%. In 1925 the British importation of watches and parts of watches was valued at £2,161,000; in 1926 it fell to a value of £961,000. The export of British-made watches is negligible, amounting in 1925 to a value of £13,000 and in 1926 to £24,000. (H. H. C.)

MASS PRODUCTION OF WATCHES

The use of duplicating machinery for watchmaking began in America with Henry Pitkin of Hartford, Conn., in 1838, but with no stress on interchangeability. The American Waltham Watch-Company early in 1853, in Boston, produced watches in quantity. This was the parent organization of some 30 odd American factories, of which, in 1928, only the Elgin, Hamilton, Illinois, Howard and South Bend factories existed, producing from about 100 to some 4,000 watches each, or a total of 8,000 to 10,000 per day, over 3,000,000 per year. The present-day automatic machinery has been developed by many inventors and designers among whom are Sherwood, Webster, Marsh, Stratton, Moseley, Woerd, Hart, Church, Ohlson and Gabriel.

Modern Methods.—There have been two rather different routes to mass production of watches; (1) following the making of the conventional watch; and (2) making little clocks smaller and smaller, but essentially along lines developed in mass production of clocks (*q.v.*). The pioneer unit of mass production in cheap watches was the Waterbury watch (about 1890), but it had a short-lived popularity because of the greater amount of time required in winding its 8 ft. mainspring. The production of these watches exceeded 500,000 per year.

The New Haven Clock Company then began making a clock wound from the back, small enough to be carried in the pocket, and this was followed by a smaller one by the Waterbury Clock Company. It was due, however, to the merchandising genius of Robert H. Ingersoll that enormous production has come into being. His business passed in 1922 to the Waterbury Clock Company. Other companies followed and of those in America continuing in 1928 the Western Clock Manufacturing Company, the Ingraham Company, the New Haven Clock Company and the Ingersoll Watch Company, each produce daily from 5,000 to 14,000 watches or a total of about 10,000,000 per year. The size of the cheap watch has been reduced from an 18 to a 12 and even to a 6 size. An 0 size wrist watch has been manufactured. (The sizes of movements are designated by 30ths of an inch over the 0 size which is $1\frac{5}{30}$ inches.)

Recent Improvements.—Many improvements have been made in the design of cases, by chromium plating and luminous dials. While each factory has its own processes in detail, the example from one factory in which there are 117 pieces is described here as being fairly typical. Forty of these pieces are made on screw machines, 38 in presses and 39 on forming or heading machines. The frame plates are blanked from sheet brass at the rate of 25,000 to 50,000 per day per machine, pierced 15,000 to 16,000, reamed 2,000 to 3,500 and finished 12,000 to 14,000. The wheels stamped finished from sheet brass by compound sub press dies come through at a rate of 50,000 to 100,000 per day. In this press the holes are pressed downward and the wheel upward simultaneously, the severed parts coming back in original position so that the sheet may be pushed onward for duplications. The small toothed wheels (pinions), are produced in three ways: (1) by milling the teeth from a solid blank in a screw machine; (2) by turning down for arbor and pivots from pinion rod (which has been produced by a drawing process giving the proper shape of teeth); and (3) the lantern pinion, in which two brass collets on the arbor carry into proper holes short steel wires as teeth.

A screw machine will produce from 800 to 1,500, and a pinion milling machine from 500 to 3,000 per day. In the lantern pinions the arbor of wire of proper size has pivots turned on it by an automatic screw machine at a rate of 2,000 to 3,000 per day. The collets will then produce from 3,000 to 5,000 partly finished pinions. These go from a hopper to an automatic drilling machine which drills through one collet and partially through another the circle of holes for the short wires at 3,000 to 5,000 per day.

Dials are punched from sheet brass, buffed, plated, wire-brushed and lacquered. The numerals are applied by a rubber roller taking ink from multiple electros and with this press two operators will produce from 5,000 to 8,000 dials per day. Hands made from steel or from nickel silver for holding luminous material, are progressively pierced for the centre hole, swaged for the socket and blanked in a press capable of producing over 100,000 per day. The blueing is done in an appropriate furnace.

Time of Manufacture.—Taking another example to give a more concrete conception of rapidity with which operations are performed, the following outline, covering nearly all the steps in the making of "a mass production watch," gives the equivalent time of manufacture of one individual watch in seconds:

The back plate, involving 17 operations by 25 hands for 103 seconds; front plate, 12 operations by 7 hands, 29; barrel, 10 operations, boring, levelling, turning, sizing, punching hook for spring, assembling spring, fitting arbor and testing, 69; centre pinion pivoted, 29; other pinions pivoted, each 40; wheels stamped, 0·3; staking centre wheel on pinion, 4; staking third and fourth wheels on pinion, each 7; fitting centre arbor, 4; staking escape wheel on pinion, 7; making brass screws, 1·25; making steel screws, 2·5; making winding stem, 15; grinding balance staff, 3·6; fitting balance and pinning hairspring, 51·4; drilling for impulse pin, 4·1; staking impulse pin, 4·5.

Putting in balance staff, 4·8; truing wheel in press, 4·1; lining up, 4·5; putting on roller, 5·5; general inspection, 4; spinning, 4·3; poising balance, 18·9; assembling movement, 72; washing movement, 4; oiling train parts, 20·5; fitting stem and winding wheel, winding with lever not in, 4; lever put in, inspection for end shake and winding, 45; putting on hairspring, 4·5; truing hairspring, 17; vibrating hairspring, 91·1; setting balance to beat, 7·2; putting hour hand on hour wheel, 2·4; putting on dial and hour wheel, 17; putting on minute and seconds hands, 17; putting in case, shaping hands, driving three screws and putting on temporary back, 117; oiling and winding, 42·3; timing, comprising four 24 hour runs with dial down for interference of hands, pendant up with two-minute tolerance and another run with permanent back and bezel on, 170; putting on permanent back and bezel, 14·4; inspection and packing, 18·2. The making of the case involves 16 operations, ranging from four-tenths seconds to nine and seven-tenths seconds; total, 36 seconds.

(P. M. C.)

WATER, considered chemically, is an oxide of hydrogen having the composition H_2O (*see* below), but naturally occurring waters all contain impurities in varying degrees. Most water is derived directly or indirectly from the ocean by evaporation, condensation in clouds and precipitation, as, for instance, in the form of rain, after which, it reappears in rivers, springs, lakes, etc. In evaporation the salts contained in the ocean are left behind, and rain water is therefore free from these; but it acquires traces of ammonium salts and various gases from the air, and traces of sulphuric acid derived from the burning of sulphur in coal, in the neighbourhood of towns. Lake waters are relatively pure, especially in mountainous districts where pollution from animal, agricultural or industrial sources is minimised, but they may contain considerable quantities of suspended mineral or peaty matter. River waters acquire a variety of impurities from soils which they traverse, from drainage of fields, and from factory and sewage effluents, and shallow well waters are frequently vitiated from the first two of these causes. Spring waters and deep well waters have usually undergone a prolonged process of filtration which tends to clarify them from suspended matter, and to purify them from dangerous contamination, but at the same time they acquire considerable quantities of dissolved salts.

The nitrogenous organic matter in waters is a useful indication of contamination. Certain bacteria break down this material into ammonia, which is slowly oxidised to nitrites and nitrates by other bacteria. By Wanklyn's method of water analysis it is possible to find, (1) the amount of "free or saline" ammonia, and (2) the amount of "albuminoid" ammonia, which is a rough index of the organic matter still undecomposed. Although the free ammonia itself is harmless, it is an almost certain indication of former pollution. A consideration of these two quantities, in conjunction with the source and history of the water, is of great value in determining its suitability for human consumption. So many factors are involved that it is useless to give definite figures, but it may be said that if either type of ammonia (and especially the second) exceeds 0·005 parts per 100,000, the water is open to suspicion, and if they exceed 0·010 parts, it is probably dangerous. Further, the presence of nitrites in water is an almost certain indication of recent sewage contamination, otherwise nitrates and not nitrites would be found. Prolonged aeration tends to destroy the organic matter on which harmful bacteria thrive, and boiling almost invariably renders waters safe for consumption.

The saline constituents of a water have some effect on its potability but are more important in connection with industry. The dissolved salts are largely those of calcium and magnesium, which are retained in solution owing to the presence of carbon dioxide (*see* CALCIUM). These salts cause "hardness," *i.e.*, they hinder the lathering of soap. When hard water is boiled, the carbon dioxide is expelled, and calcium carbonate is deposited as a "fur" or boiler crust; the hardness due to this cause is therefore called "temporary," whereas that due to other salts (magnesium and calcium chlorides and sulphates) which are not thus deposited is called "permanent." In determining "hardness" successive small quantities of a standard soap solution are added to a known volume of water in a bottle which is shaken after each addition. After a time a lather forms which has only a transitory existence, but at a certain stage it will persist for some minutes. The volume of soap solution necessary to secure this condition is noted, and the hardness can then be calculated. The soap solution is usually standardised to give hardness as parts of calcium carbonate per 100,000 parts of water, or sometimes (as in Clark's solution) in grains per gallon (1 part in 70,000). Roughly, it may be said that a "hard" water shows more than 15 parts (or degrees) and a "soft" water less than 5 degrees.

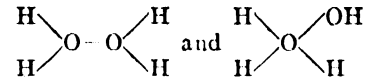
A water with much temporary hardness can be softened by adding just sufficient milk of lime to combine with the excess of carbon dioxide, whereby all the chalk is precipitated. Many water softeners are marketed under various names, *e.g.*, "Sofnol," "Permutite"; the latter is a natural or artificial zeolite (*q.v.*) which exchanges sodium for calcium when a hard water is passed over it, and which is "revived" by contact with brine. The purest water ordinarily obtainable is procured by distillation (*q.v.*) which leaves all solid impurities in the still.

Pure Water.—Absolutely pure water is probably unknown.

"Chemically pure" water of the laboratory is extremely difficult to prepare. Ordinarily pure water is used as a standard for many weights and measures. Thus, a gallon is defined as the volume at 62° F of 10lb. of water when weighed in air at 30in. barometric pressure and at 62° F. Similarly, the original kilogram was supposed to be the mass of 1 cu.dm. of water at 4° C. (It is now known that the kilogram is not strictly what it was supposed to be; consequently, it has to be redefined as the mass of a particular standard—the "kilogramme des archives." This means that the litre, which is based on the kilogram, is not strictly 1,000 cu.cm. and the tendency is to use the *millilitre* instead of the cubic centimetre for very accurate work: 1 ml. = 1·000027 cu.cm.) The fixed points on thermometric scales are based on the melting point of ice (0° C; 32° F) and the boiling point of water (100° C at 760mm. pressure; 212° F at 30in. pressure). Specific heats are usually referred to that of water as unity, because the unit of heat is based on the heat capacity of water. The specific heat of water (which is about 1% greater at 0° and at 100° than at 25°) is greater than that of almost all other liquids (liquid ammonia is the chief exception); it is owing to this property of water that insular climates are subject to less extreme changes of temperature than continental climates.

Another remarkable property of water is its increasing density, on being cooled, to a maximum at 4° C, after which further cooling causes it to expand, and on freezing it expands rapidly. The following are the figures of this change in density:—

Water at 10° C=0·99973
Water at 100° C=0·9585
Ice at 0° C=0·9175
Water at 0° C=0·99987
Water at 4° C=1·00000 (by definition of kilogram).



The significance of this is dealt with in the article ICE.

On conversion into steam at 100°C, one volume of water expands about 1,700 times under ordinary pressure and absorbs 538 calories per gram as "latent heat of vaporisation." Its critical temperature is 370° C—whatever the pressure, it cannot be liquefied above this temperature. The peculiar ability of water to initiate or to facilitate (*i.e.*, to "catalyze") chemical reactions is described in the article DRYNESS, CHEMICAL; it is ascribed by H. E. Armstrong to its dissolution of traces of the reactants or of "impurities" to form conducting solutions.

Constitution.—In former times, water was regarded as an "element," and even when this term acquired its present usage the idea was not abandoned, although water had been decomposed in various ways. It was not until Cavendish prepared pure hydrogen and burnt it in air to form water that it came to be recognized as a compound. He further showed it to be formed from 2·014 vols. of hydrogen and 1 vol. of oxygen, and it was only many years later that the researches of E. W. Morley, A. Scott, Leduc, Lord Rayleigh and others showed that this slight deviation from the theoretical ratio (2:1) is due to the two gases showing slight deviations from Boyle's law at ordinary pressures (*see* STOICHIOMETRY). The gravimetric composition is 2·0154 parts of hydrogen to 16·000 parts of oxygen.

It seems probable that liquid water is a mixture of several types of molecules $(H_2O)_3$ and especially $(H_2O)_2$ predominating. Many of its physical properties point to such a conclusion (*see* ASSOCIATION); thus, the latent heats of fusion and vaporisation (*vide supra*) are much higher than those of most other liquids, and this is attributed to the heat absorbed in breaking down complex into simpler molecules. The ice molecule—possibly $(H_2O)_3$—is undoubtedly bulky (witness the low density of ice, *q.v.*), and the occurrence of a point of maximum density of water is probably due to the normal expansion of the liquid being outweighed by the contraction due to these $(H_2O)_3$ molecules, which have persisted in the liquid, breaking down to less bulky $(H_2O)_2$ molecules.

The foregoing ideas have been variously expressed by different chemists. Thus, I. Traube postulated the existence of "gasogenic" (simple H_2O) molecules, and "liquidogenic" (complex) molecules; and A. W. C. Menzies (1921) confirmed that steam at 100° C contains only H_2O molecules. W. Sutherland, from a consideration of all the physical properties of ice, water and steam, assigned values for these properties to each of the molecular species $(H_2O)_3$, $(H_2O)_2$ and H_2O, and calculated that water at 0°C contained 37·5% of "trihydrol" and 62·5% of "dihydrol." H. E. Armstrong believes that, among other molecules in water, the H_2O_2 molecules are of at least two types:

dihydrone (inactive) and hydronol (active), respectively. Finally, A. Hantzsch believes water to be a basic anhydride $[H_3O]_2O$ of the oxonium hydroxide $H_3O{\cdot}OH$ in conformity with oxonium salts such as $H_3O{\cdot}Cl$ and the so-called "hydrogen ion," which is possibly H_3O^+ (*see* ACIDS). (A. D. M.)

WATER-BOATMAN, an aquatic hemipterous insect of the family *Notonectidae*, of which the best-known species (*Notonecta glauca*) is common in the ponds of Great Britain. The technical name, *Notonecta* ("back-swimmer"), alludes to the habit of the insect of swimming upside down, the body being propelled through the water by powerful strokes of the hind legs, which are fringed with hair and, when at rest, are extended laterally like a pair of sculls in a boat. This insect is predaceous, feeding on aquatic larvae or worms. The body is provided with special hairs which serve to retain bubbles of air for respiration when the insect is submerged. The eggs are laid in the stems of water plants.

WATERBUCK, a large South African antelope (*Cobus ellipsiprymnus*) of the subfamily *Cervicaprinae*, characterized by the white elliptical ring on the buttocks and the general reddish grey colour of the long coarse hair. They have heavily fringed necks and tufted tails; long sub-lyrate, ringed horns are carried by the bucks only. The name is extended to include the sing-sing (*C. defassa*), a widespread species, without the white ring. Both species equal the red deer in size. (*See* ANTELOPE.)

SING-SING (COBUS DEFASSA)
This animal is a species of waterbuck found in West and Central Africa

WATERBURY, a city of western Connecticut, U.S.A., one of the county seats of New Haven county; on the Naugatuck river, 21 m. N.N.W. of New Haven. Pop. (1920) 91,715 (33% foreign-born white); local estimate 107,400 in 1928. It is the centre of the brass industry of the country. Other products are clocks and watches, silverware, files, recording instruments, machinery, chemicals and acids.

The city's assessed valuation was $164,828,901. The town of Waterbury (settled in 1677) was set off from Farmington and incorporated in 1686. The city was chartered in 1853, and in 1901 city and town were consolidated. The brass industry dates from 1802, when the manufacture of brass buttons was begun. Sheet brass was first made in 1830. Iron buttons covered with silver had been made about 1760; block tin and pewter buttons about 1800. Tall wooden clocks were made here in the latter part of the 18th century. The manufacture of cheap watches was begun in 1879; these were long distinctive of Waterbury, and were often called "Waterbury watches." Broadcloth was first made here in 1833.

WATER CHINQUAPIN (*Nelumbium luteum*), a North American aquatic plant of the water-lily family (Nymphaeaceae), called also American nelumbo or lotus, rare and local in ponds and slow streams from Connecticut to Michigan and southward to Florida and Louisiana. It is a stout plant, rising from a horizontal tuber-bearing rootstock, with large shield-shaped leaves, 1 to 2 ft. across, some floating but mostly rising high out of the water, and solitary pale-yellow flowers, 4 to 10 in. broad, borne on long stalks usually higher than the leaves. The edible tubers and farinaceous seeds were used for food by the Indians, who probably introduced it into the eastern States. It is sometimes grown in water-gardens for its ornate foliage. (*See* WATER-LILY.)

WATER-COLOUR PAINTING. The art of water-colour has passed through a renaissance since about 1890 and has again assumed a recognized place among the mediums of artistic expression. For many years the medium had been looked down upon and considered unimportant, and of use only in young ladies' "finishing schools." The 20th century has seen this most spontaneous of all mediums regain its eminence and vital beauty. A small group in England, the United States and France kept the use of water-colour alive until the present awakening, and great water-colour societies have now grown up and become of national and international importance.

HISTORY

Ancient Chinese Art.—Water-colour in its various forms constitutes one of the finest and most permanent records of art that has come down to us, reaching back into the 3rd century of Chinese art, and it was also used both by the Japanese and the East Indian artists in various forms. We find in the Chinese art a great use of clear water-colour and some use of tempera (*q.v.*). Brushes for the very fine work were as a rule made of sable hair; selected pig bristles were used for coarse textures. An elaborate and adroit handling of the brush was cultivated, the result being a delicate and exquisite line; design was ranked above colour in most of the early work. It is interesting to note that water-colour was always used in the East to a much greater degree than oil, being more delicate and of greater flexibility.

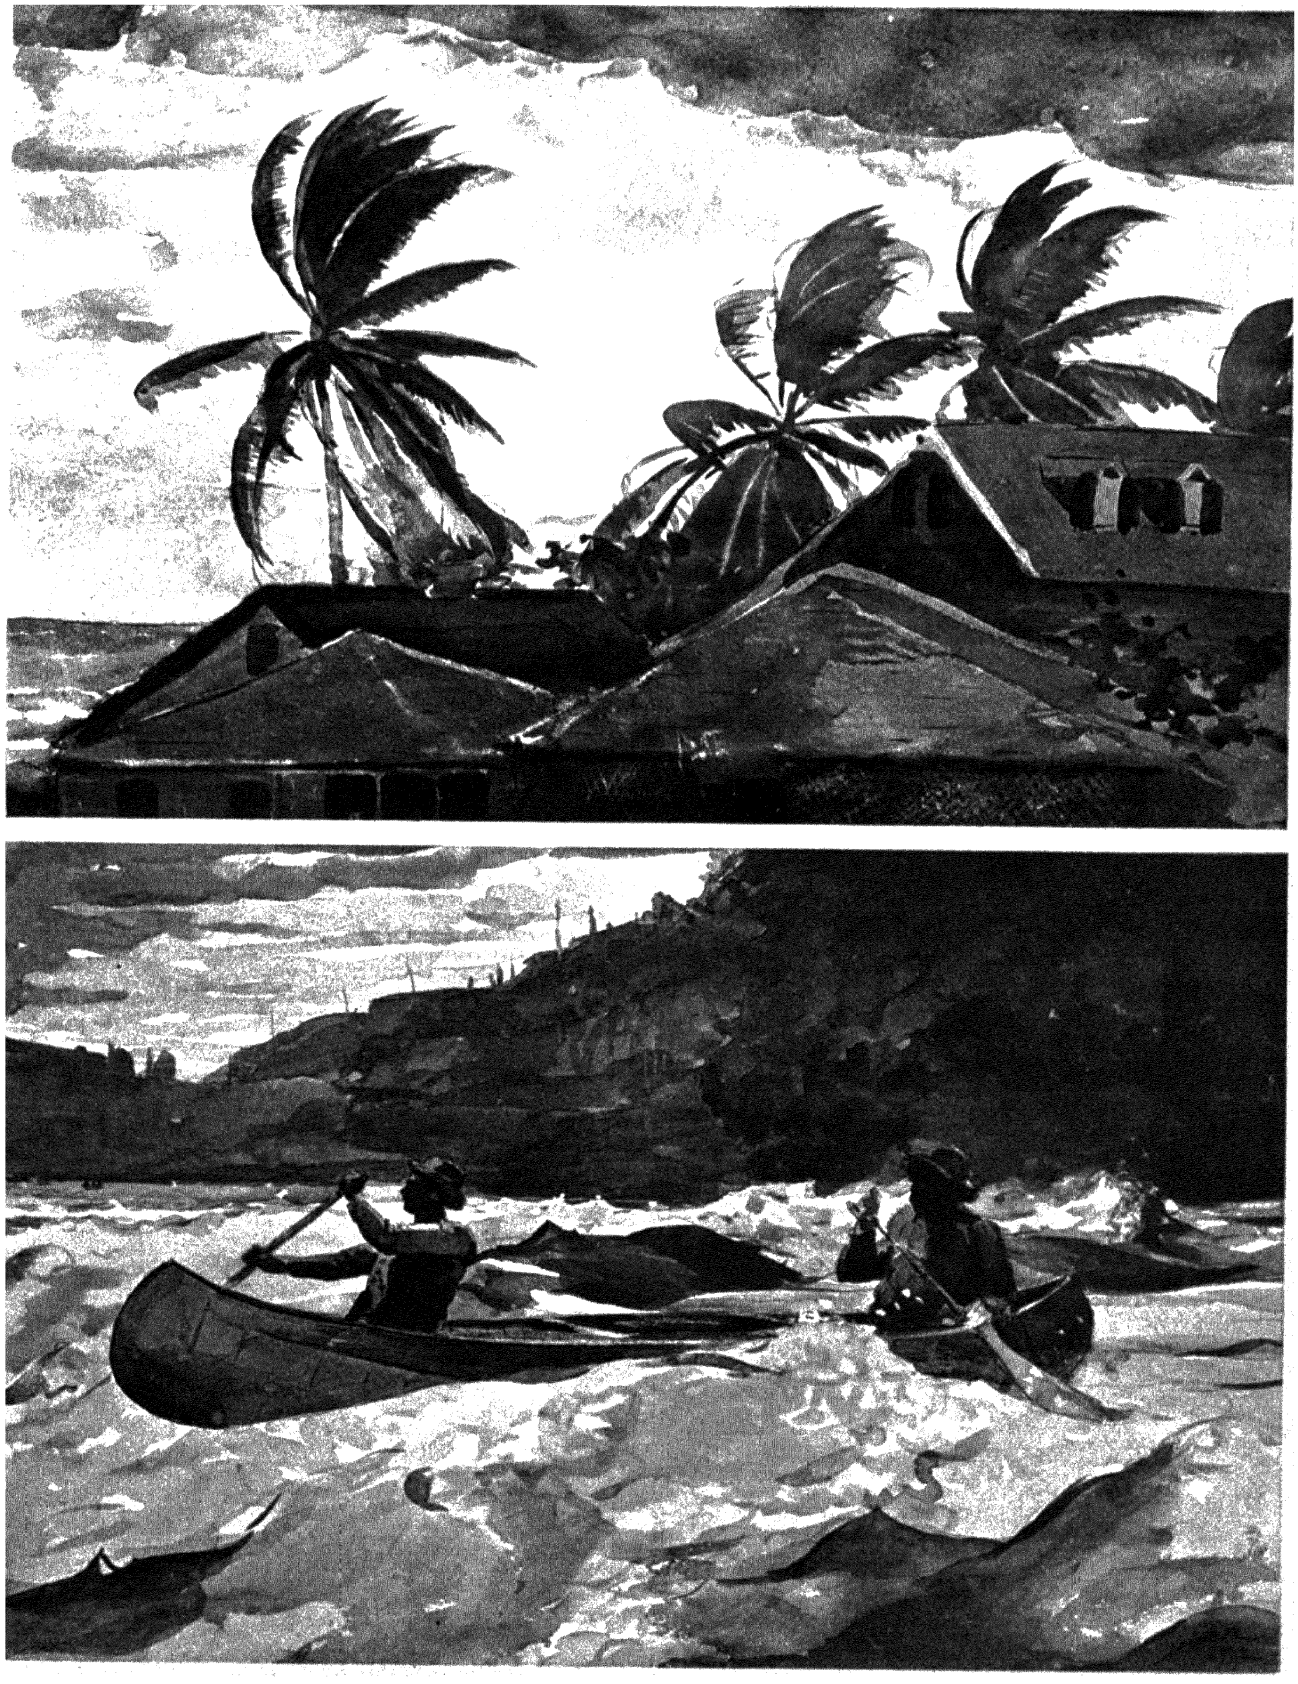
Paper and silk were the surfaces used. Paper of wood bark came first, and then silk was made into a kind of paper but it was found too glossy; then came a tough rice-paper. Silk was mounted on paper and glued down to hold the colour intact and keep it from spreading. The backing was built up by placing layers of paper on successively, and it is said that the silk was moistened and stretched, which seems reasonable since we stretch our fine rag papers to-day. The ink, of course, went through, onto the backing, making two pictures. Black ink was frequently the only colour used, though dark brown, or sepia, appears. The most interesting impressions were done in ink by the masters of the Sung dynasty and by the Japanese of the 15th century. (*See* ART: *Far Eastern Methods;* CHINESE PAINTING; JAPANESE PAINTING AND PRINTS.)

Rich colour and much use of gold dominate the Buddhist pictures. The masterpieces of the religious painters contain a fine rhythm of design, which gives them a fundamental character, exquisite subdued colour, and is also found in the flower designs and birdpieces. Poetic suggestion, and not representation, was the most important part of the Ming art, and helped to explain the great use of water-colour. In the Sung dynasty, lampblack began to be used, mixed with a glue made from donkey hides boiled in water. The glue obtained is the colour of amber, glossy and odourless, and is mixed with black made from soot which is obtained from imperfect combustion in the burning of dry pine or fir. This was used to the end of the Yuan dynasty, notably by Tung Chi-Chang, Wu Wei and Fu Shan. This depth of colour and glossiness was lacking in the Ming ink as used by Shên Chau, T'ang Yin, Weu Cheng-Ming and Ch'in Ying. In the Sung work (*see* Plate I.; figs. 1 and 2), no attempt was made at modelling; consequently there was no trace of light and shade. The figures stand in a flat light. Of course, this enhances the decorative effect greatly. The following artists of the Sung dynasty (A.D. 960–1280) are the outstanding ones as far as known: Wen Tung, Tung Chi-Ch'ang, Wu Wei, Fu Shan, Shen Chan, T'ang Yin, Wen Chêng-Ming, Ch'in Ying, and Kuo Chung-Shu.

Japanese Art.—From the 6th century the development of painting may be shown as follows: (1) middle of 6th to middle of 9th century: naturalization of Chinese and Chino-Buddhist Art; (2) middle of 9th to middle of 15th century: establishment of great native schools under Kose no Kanaoka and descendants—pure Chinese school falling into neglect; (3) 15th to latter part of 17th century: revival of Chinese style; (4) latter part of 17th to latter part of 18th century: popular school; (5) 18th to 19th century: introduction of European influence—naturalistic school—acme and decline of popular school; (6) 1875 to present: a period of transition.

Painting began in the 5th century, brought by Nawrin from China. By the middle of the 6th century a real art of painting, of which Buddhism was the main theme, had begun. The art was thereafter carried out under Korean and Chinese immigrants. Toward the end of the 9th century, two exotic styles of painting flourished, and on these a native style had been founded which featured landscape of a romantic kind, animal life, trees, flowers and designs representing legends of olden times. The exotic Buddhist style brought a change. Of Indian origin or influence, it was brilliant and decorative, with a lavish use of gold, and confined to representations of sacred personages and places. The principal painters of this period, extending into the succeeding centuries, were of the Kose, Takuma and Kasuga lines, descending from Kanaoka, Takuma Tameuji, and Fujiwara respectively. Last and greatest was Meicho, or Chō Densu, who died in 1427.

The beginning of the 11th century shows adaptations of Chinese canons to motives selected from poetry, court life, and legends of Old Japan. This art was characterized by a lightly touched outline and tinted with flat and bright body-colour. Verdigris-green dominated the schemes. Important names are Fujiwara no Motomitsu (11th century), Nobuzane and Tsunetaka (13th century), Mitsunobu (15th and 16th centuries), Sishu (1421–1509), Shūbun and Kano Masanobu (1424–1520), Mitsushige and Mitsuōki (17th century).



A popular period began with the establishment of a school of art by Hishigawa Moronobu (1646–1713). He created a progressive and trustworthy life about him, expanding his followers' artistic natures. After this came a development of realistic art, which compares in time with the European style. This manner has its importance in the great harm it did to Japanese art. It attempted to reproduce nature and all forms exactly, combining European chiaroscuro and linear perspective with the Japanese style. Glass, tapestry and furniture suffered as well as pictures. Except for the existence of water-colour painting, the loss would have been still greater. (*See* JAPANESE ART.)

Persian Artists.—During the 8th century, Turkistan princes sent into China for their artists and in the conventionalization of certain forms and flat treatment of figures, a trace of Chinese influence is discernible. The few surviving paintings of the Mongol period are in the Persian manuscripts of the "History of Ghenghis Khan and Family," and are the most important, dating back to A.D. 1314. Here the Mongol types and fashion of drapery are manifested. At Herat, the most famous of the Persian masters, Bihzad, who founded a National School of Painting, changed the course of the native art. Bihzad illustrated manuscripts of the two most famous poets, Sadi and Nizami. The Sultan, Mahmed, worked in Mirak's studio and Mirak, who was born A.D. 1500, was a pupil of Bihzad.

The most important contribution of Persian art, and to it the Indian is closely allied, is its charm of colour. As the school matures, it shows a weakening of design, becomes less coherent, and conventions become dominant; vitality is lost and expressiveness of drawing is smothered. But the gem-like colour and refined luxury give a marvelous atmosphere of sensuousness and beauty. Figure work was not done from living models. The painters recreated the entire scene in their mind and in putting colour on material suggested such detail only as was essential to the depicting of the tale. This lack of realism gave a splendid feeling of all-over pattern (*see* Plate I.—Persian Art; Plate I., fig. 3—Water-Colour Painting). Chiaroscuro and modelling were not important in painting, and third dimension was sedulously avoided; decorative effects in two dimensional space were aimed at. (*See* PERSIAN ART, PAINTING AND CALLIGRAPHY.)

Indian Technique and Materials.—The earliest material used in painting was a red haematite which was mixed with an animal fat. The outlines were made with a pointed stock, brushes being of such poor quality that it was not possible to bring them to a point; they were probably made of vegetable fibre at first. White was obtained from an earth substance, possibly a clay or lime; black was obtained from dried astringent prune-like fruit.

Frescoes.—The Buddhist frescoes were painted over a roughly

WATER COLOURS BY WINSLOW HOMER

Top, "Tornado—Bahamas." Bottom. "Shooting the Rapids." Winslow Homer (1836–1910), an American artist well known as a painter of landscape and genre pictures in oil, was equally distinguished for his water colours, of which two are here reproduced. They are good examples of his sure, vigorous brush work, and the directness and economy of his method

excavated wall, first prepared with a coating made of a mixture of clay, camel dung, and trap rock, to the thickness of ⅛ to ¼ inches. This surface was then coated with a thin layer of white plaster and the painter was ready to paint frescoes in water-colour. The method used is open to difference of opinion. True fresco was done on wet plaster. If a part of the design did not suit the artist, he had to cut out that section and apply a fresh coat of wet plaster. The other method (*fresco secco*) is a combination of fresco and tempera. The plaster ground is allowed to dry before painting. True fresco is favoured but much more difficult because a design cannot be changed except as mentioned above.

The *Rajput* painting was a mural in design but done on a small scale. Paper was used instead of a wall-surface. The Mogul miniatures were painted on a paper composed of bamboo, jute and cotton. The surface was carefully rubbed smooth with a rounded agate. Later English painters took rough paper, painted their figures on it, but rubbed the surface smooth where the heads were to be. A fine texture was acquired in this way.

These various processes of clear colour, fresco, tempera and combined methods of water-colour and inks, paved the way for the development in southern and western Europe. Italy took what was best suited for its climate, tempera; fresco for wall-surfaces, and the mixed methods of tempera and ink for book illumination scrolls, and later for studies to be developed in larger oil painting, as oil became better understood during the Middle Ages. Water-colour slipped lower down the scale of artistic and popular appreciation. The return to active use of water-colour now heralds a real awakening of art and promises tremendous progress in the near future. Beauty of colour and dignity of design will strip the old ugliness of things from our everyday lives and prevent the return of naturalistic abominations. (*See* INDIAN AND SINHALESE ART AND ARCHAEOLOGY.)

DEVELOPMENT OF WATER-COLOUR PAINTING

The methods and achievements of the great water-colour painters have apparently modified the modern technique of oil painting. The looser handling of modern oil paint, and the lightening of its colour scheme by the elimination of some of those darker pigments to which the older works owed so much of their massive solidity and gloomy grandeur, seem to be due, at least in part, to the example set by water-colour painting.

This modification of the aims and practice of oil painting by the example of water-colour may be regarded as merely a reversion to type, for water-colour painting is by far the older method. The paintings in the caves of Altamira and Perigord (said to date from some 10,000 or 12,000 years before the Christian era), the paintings on the walls of the tombs of the Egyptian kings (1700–1400 B.C.), the frescoes in the Palace of Cnossus (1600 B.C.), in the buildings of Pompeii and the Catacombs, the illuminated manuscripts and wall-decorations of the Middle Ages, were all wrought with pigments in a state of fine powder, mixed with gum or some other binding vehicle which is soluble in water. Water-colour painting may thus be considered as the universal form of pictorial art, the substitution or addition of various other liquid vehicles than water (such as oils, varnishes, wax, the juice of figs, size, the white or yolk of eggs), producing the subordinate distinctions of oil painting, encaustic, fresco, true fresco, tempera, etc. But during the 16th, 17th, and 18th centuries, oil painting reigned supreme in Europe, and water-colour painting was looked upon as an inferior, or at least as a subordinate or antiquated form of art.

The water-colour mediums, however, were far too useful to the artist to be abandoned, even when oil painting was in the height of its favour with the public. Water-colour dries more quickly than oil paint, and therefore is more suitable for use in works which require rapidity of execution; it is also handier and more easily carried about. It therefore remained the favourite medium with artists for what may be termed their private work, *i.e.*, for recording their first ideas of a composition, and for making preliminary studies. Rembrandt's and Claude's pen and ink drawings with washes of sepia, India ink or bistre, for the shadows or darker tones, may be regarded as typical of much of this private or preliminary work. A number of brightly coloured landscape studies by Dürer (1471–1528), Rubens (1577–1640), and Van Dyck (1599–1641), may be mentioned, also figure subjects by Jordeans (1593–1678), Adrian van Ostade (1610–1685), and Cornelius Dusart (1660–1704). Such drawings, and the mass of work of which they stand as examples, belong to the sphere of the artist's private or studio practice.

GREAT BRITAIN

Renaissance of Water Colour Painting.—Water colour painting was a forgotten art until about the year 1700, when English artists began using this medium. Previous to this period, water colour was used only to tint pen and pencil sketches. Pen and ink, both black and brown, with superimposed tints of sepia and blue were first used. These tints of colour suggested the warm and cool masses. Monochrome also came into general use at this period. Monochrome lacked range and sequence and was soon superseded by the above-mentioned addition of colour.

During those early years three forms of water colour painting came into use in England:

First, colour and water were mixed and used on white paper, often with the addition of fine pen lines to strengthen the drawing. Rubbing or scrubbing the colour after it had been laid on the paper darkened and dimmed the lustre just as it does in the modern day method of painting in water colour.

Second, the employment of opaque, gouache, or body colour. This form comprised opaque colour mixed with solid opaque white. This method is rather harsh and raw. The mixture often would clot up and become unmanageable, creating ridges of colour. It was used mostly on soft gray or tinted papers. Interesting textures were obtained with this form.

Third, a combination of transparent colour and opaque white. This is a most interesting form to use. Shadows are kept transparent and the light masses loaded. Clever handling and the accidental quality of clear water colour is present in this method.

These three methods are in active use to-day. Clear water colour painting seems capable of expressing more in the way of sheer beauty, atmosphere and power than the other forms.

Figure studies and decorative motives by Albrecht Dürer (1471–1528), Rembrandt, and Claude are important landmarks in the development of the early periods of water colour; also Peter Paul Rubens (1577–1640); Cornelius Dusart (1660–1704); Francis Barlow (1626–1702); and Honoré Daumier (1808–1879).

This type of drawing formed the basis and beginning of the great art of water colour painting in England, both by nature and climate adapted to this form of artistic expression.

First Period—(1725–1780).—The early period of British water colour development can be dated from 1725–1780. Within this time progress was made and many artists destined to become great were born. The work done during these years was carefully topographical and painstaking. Pen and tint drawings represented their range. Landscape was beginning to be used as a theme in pictorial art, though in a tentative and monochromatic form. Real colour was not understood or used. Colour makers had not appeared on the scene and artists using this medium were obliged to grind and prepare their own colour. When one considers the modern artist and his absolute lack of knowledge of what his colour is made, and how it is prepared, all praise must be accorded to the artists of that time who made almost every kind of material for themselves.

Paul Sandby (1725–1809) laid the foundations of landscape painting in England. His early drawings carried a fine, closely drawn line around the objects used in his compositions. Then an India tint was imposed over parts of this picture. As he gained in knowledge, varied colour was used and the outlines were softened to effect a chiaroscuro. He gradually began to add more and more colour through superimposing hue upon hue, timidly perhaps at first, but building solidly and in advance of his time.

When water colour first emerged from the early monochromatic state, artists of this period sensed its possibilities and began a series of experiments that was destined to restore this medium to its rightful place as a great means of art expression. Samuel Scott (1710–1772), Michael Angelo Rooker (1743–1801) and Thomas

Malton (1748–1804) were eminent exponents of water colour. Malton painted architectural subjects with great distinction. John Alexander Gresse (1741–1794), William Pars (1742–1782) and Francis Wheatley (1748–1801) are representative of the fine art of this time.

Second Period—(1780–1850).—This second stage of development brought forth the real force of water colour and cemented the foundations laid by the earlier painters, developing from pen and wash or tinted drawings into water colour painting of great quality and power. In the beginning of this period a number of colours were already being made by a rapidly growing gild of colour makers.

John Robert Cozens (1752–1797) produced work of a high order, romantic and imaginative, possibly influenced by Claude, but striking boldly into an undeveloped realm of landscape composition and showing the way to many young artists of this period.

William Blake, Thomas Girtin and J. M. W. Turner were outstanding painters of this period. Blake and Turner were romantic and highly imaginative, leaving the common highway to delve into unexplored phases of painting. In each existed the impulse to subordinate reality and seek romance in colour and design. Blake delved farthest into that unknown world, while Turner roamed in a world of colour, making colour his servant and slave. Girtin painted landscape with a splendid feeling for scale, mass, and atmosphere, holding that simplicity was great art. He was friendly with and undoubtedly influenced many of his younger contemporaries. Turner and Cotman both profited by their association with Girtin.

These painters, each in his way and manner, left a great impress on the art in England, not only on water colour painting, but on the medium of oil. Girtin's impress extends over this entire period and helped to create the modern school of water colour painting. Cotman excelled in clear, limpid, flowing colour.

Peter De Wint (1784–1849) used a rich palette, saturated his paper and while it was wet brushed the colour into it. In this manner he maintained, or avoided disturbing, the bloom which is one of the beauties of water colour, and which accounts for the transparency of his tones. Superimposed colour almost always deadens brilliancy and makes it look sodden.

De Wint, and also Cox, obtained a beautiful quality in their sketches. De Wint obtained fine colour effects in his broad rough way, using the brush vigorously and with interesting suggestiveness, not bothering with, nor caring for the naturalistic, but creating an impression of air and wind, and solid things. Cox's sketches took the form of notes, design not playing much of a part, but his loose handling and reminiscent colour imparted a great charm to his work.

Dayes used water colour in an architectural manner, choosing subjects possessing great detail and handling these compositions in a large way. While he was inclined toward colour and experimented freely with that method of expression, yet he never fully accepted it. Dayes' influence on Turner's early work was unquestioned.

Girtin profited also to a large extent through Dayes' experiments in warm and cool colour. By the last years of the 18th century Turner and Girtin had surpassed Dayes in quality and colour. Turner may be classed as the most important colourist of this period. Another note of interest is that Turner's water colour practice exerted a very strong influence upon his oil painting. He was able to experiment quickly and easily in this medium and to obtain the effect of clarity and richness. He realized that the transparency and fluidity of the lighter medium would tend to lift oil out of its heavy dull manner, as it was practised at that time. This was a matter of evolution, of one medium flowing into another. Water colour has a verve and spirit all its own and the painters of this period realized its value both as an individual art, and as a helpmate in reclaiming oil from its sloth of dullness.

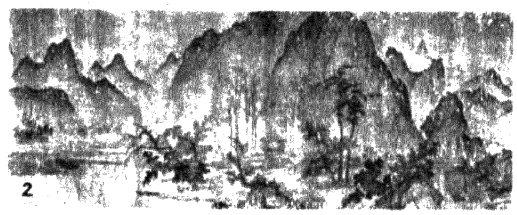
Lustreless blues and browns gave way rapidly to Turner's swift and fresh sense of colour. It is an extremely noteworthy fact that sketches, tinted drawings and water colour paintings reveal the spontaneous artistic soul of an artist. He seems freer and less bound by convention and an academic view of Art. Turner, through the use of water colour, vitalized his oil painting and developed its brilliancy.

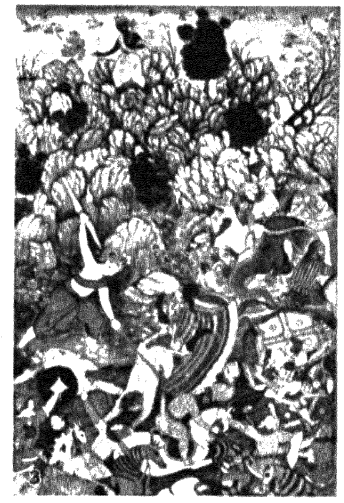
John Sell Cotman used water colour with great freedom and simplicity. His pattern and form show a fine judgment in selection. He did not clutter up his composition by useless detail. He held the masses of his picture clear and strong.

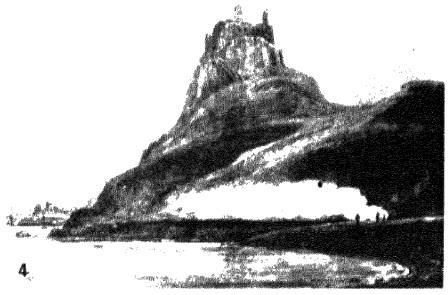
The Society of Water Colour Painters was formed in London in 1804 and its first exhibition was held in Brook Street on April 22, 1805. Most of the distinguished water colour painters exhibited their work in this society excepting Turner, who was never a member. Among the noted water colourists of this period were William Blake (1757–1827); E. Dayes (1763–1804); Thomas Walmsley (1763–1806); Francis Towne (1740–1816); John White Abbott (1763–1851); J. M. W. Turner (1775–1851); John Constable (1776–1837); Thomas Girtin (1775–1802); John Varley (1778–1842); Cornelius Varley (1781–1873); William Fleetwood Varley; John Sell Cotman (1782–1842) and David Cox (1783–1859); A. V. Copley Fielding (1787–1855); Peter De Wint (1784–1849); G. F. Robson (1790–1833); William Hunt (1790–1864).

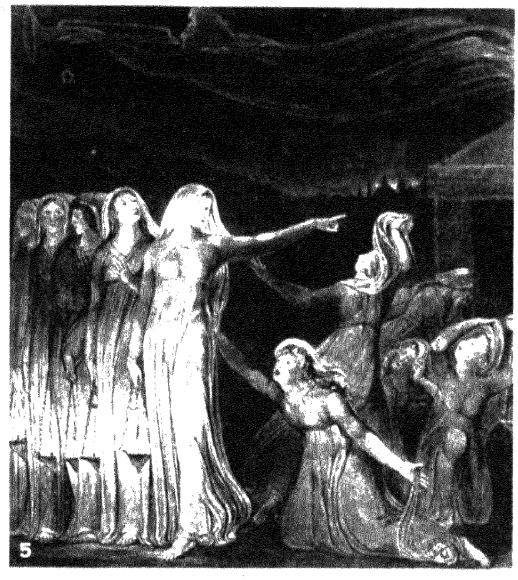
Third Period—(1850–).—By this time a number of exhibitions were being held and the painters were afforded the opportunity of showing their work to advantage. For many years past the water colour exhibitions have been important artistic and social events in England. In addition to these advantages the finest paper and colour is now preferred and sold by colour makers. The only difficulty is that too many hues and tints are made to-day. The beginner in this interesting form of art becomes confused and is liable to select a complicated and impossible palette. Simplicity still rules the world of art.

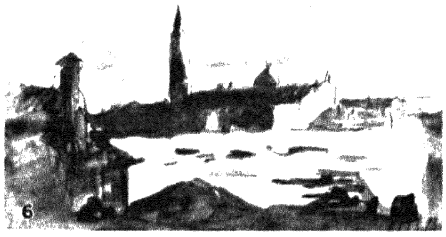
Among the many outstanding water colour painters of this period may be mentioned Sir Edward Burne-Jones (1833–1898), and Dante Gabriel Rossetti (1828–1882). They had a great deal in common. Their work was decorative and colourful. Burne-Jones used water colour in designing many stained glass windows.

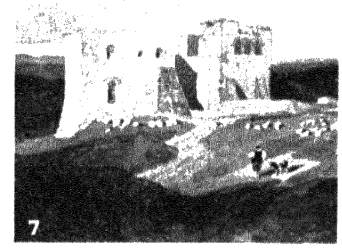












More recent was the rich and dramatic art of J. D. Innes (1887–1914). Among others who in the first quarter of the 20th century produced excellent work were Sir W. Orpen, A. M. McEvoy, J. Holland, S. Palmer, J. F. Lewis, W. Callow, T. Shotter Boys, B. Foster, A. W. Hunt, E. M. Wimperis, T. Collier, E. B. Lintott, A. J. Munnings, Arminell Morshead, P. W. Steer, W. Tryon and Sir F. Brangwyn.

THE UNITED STATES

The first water-colour societies in America were formed by small coteries of workers who appreciated the need for this medium. Then came the formation of the American Water Color Society in New York on December 5th, 1866. Some years later, Philadelphia and Boston formed groups and in 1890 the New York Water Color Club was organized. These societies endeavoured to foster and develop the art of water-colour painting early in the 19th century. Most American artists worked in oil, and water-colour was not a part of their general training. It was thought necessary to study in Paris and water-colour has never assumed a very important niche in French art. This practice of study continued until about 1890. There were exceptions to this, as Winslow Homer, George Inness and a few other painters developed their art in their own country and are called self-taught by many writers on art. Painters who have used this medium successfully find it of great value in advancing their oils; experiments may be made easily, and colour values established.

Three Stages.—The first stage of development resulted in a meticulous kind of workmanship, rather dry and not rich in

6. "The Sardine Captain" by Sigurd Skou (1877–)
7. "Sheep at the Gate" by John E. Costigan (1888–)

colour, following closely the English school and showing small promise of what it was destined to become a half-century later. The water-colour painting did not develop until after the 60's. The second stage began about 1850 and extended to 1890. It saw the rise of a number of great water-colourists who were destined to save the medium from death by dry rot, and encourage the present generation to renewed activity and progress.

The third and last stage (1890–1929) shows a combination of knowledge acquired from the preceding schools of painting and a keen analysis of what the art of water-colour is capable of giving the student in this medium. Over-modeled forms are being eliminated and design is valued at its proper worth. Colour takes a great place in rhythmic masses and naturalistic interpretation and meticulous workmanship is giving place to a finer conception of emotional feeling, and painters are becoming sensitized to the horrors of unintelligent imitation.

Such men as E. Leutze (1816–1868), T. P. Rossiter (1817–1871), John F. Kensett (1818–1873), S. R. Gifford (1823–1880), J. O. Eaton (1829–1875) and Thomas Hicks (1823–1890), represented a few of the well-known workers of this period. From 1850 a strongly marked development began. The artists of America saw the need of a fluent, rapid medium which could be used to gather material and as a means of study. This period saw a great development, with highlights here and there among the artists; Wordsworth Thompson (1840–1896), J. H. Dolph (1835–1903), Robert C. Minor (1840–1904), Eastman Johnson (1824–1906), Daniel Huntington (1816–1906), Thomas B. Craig (1849–1924).

1850–1890.—The period of 1850 can be called the dividing line between the older or representative form of water-colour drawing and the beginning of water-colour painting. Accurate drawing was the important quality to be obtained and this was accomplished much in the manner of the contemporary English school prior to 1850. The period between 1850 and 1890 records the birth and development of many painters of genius, with a decided flair for clear water-colour painting. This method of laying on colour directly and achieving deep, rich tones at the first stroke sadly upset the older and more conservative manner of building up contrasts by stages. The direct handling of flashing contrasts forced the opaque water-colour from the important exhibitions. The use of Chinese-white lowered the brilliance and purity of water-colour, giving it a chalky dull effect.

John La Farge (*q.v.*), famous for his decorative work, used water-colour to make his designs for stained glass, mosaic and mural painting. His drawings and water-colour paintings done in the South Seas added much to the art of this country. Other painters who have left their impression on the art of America and whose work is appreciated were Edwin A. Abbey (1852–1911), who used the medium in planning many large decorations; Robert Blum (1857–1903), Carleton T. Chapman (1860–1925), Harry Chase (1853–1890), Wm. M. Chase (1849–1916), William Hart (1823–1894), Francis C. Jones (b. 1857), Arthur I. Keller (1867–1924), George H. McCord (1849–1909), F. D. Millet (1846–1912), J. Francis Murphy (1853–1921), who painted beautiful water-colours, mostly landscapes, subtle and atmospheric; Edward H. Potthast (1857–1927), whose work was clear and fresh, won many prizes during his lifetime and took a great interest in water-colour; Walter Shirlaw (1838–1909), noted in his day; William T. Smedley (1858–1920); F. Hopkinson Smith (1838–1915), who was an engineer, artist and author, self-taught in the art of water-colour painting. Besides being an artist of note, he built the foundations for the "Statue of Liberty" and many other engineering works of importance. H. Vance Swope (1879–1925), used a mixed medium, almost opaque water-colour. His work had power and design. George H. Hallowell (1871–1927) used a scrub method and achieved delightful texture and colour. His life and work were centred around Boston.

Winslow Homer (1836–1910). In tracing the work of Homer (*q.v.*) through his early drawings and sketches, one is impressed with his steady advance from drawing in water-colour into the finer art of painting in this medium. Masses became more simple and colour cleaner. His water-colours were always well in advance of his oils, which makes it clear that water-colour is the most distinguished of all mediums and requires the most complete knowledge of the master artist.

John Singer Sargent (1856–1925) was born at Florence, Italy, of American parentage, and while he was educated in Europe and lived a good part of his life there, his work, and especially his water-colours, has exerted a great influence on the art of this generation in America. His clear and brilliant quality of painting offered encouragement to other painters and helped keep the medium alive. He is quoted as saying that water-colour was his best medium and capable of greater artistic expression than oil. (*See* Sargent, John Singer.)

Horatio Walker was born at Listowel, Ont., Canada (1858), and is a strong and vigorous painter who uses water-colour with fine distinction. His work shows atmosphere and quality and he uses the every-day life of farm and countryside for his subjects and understands its character, investing this life with a quaint and romantic air. While he works largely in Canada, most of his work is exhibited in the United States and especially in New York.

John Ward Dunsmore was born in 1856 near Cincinnati, Ohio. The work of this artist, while careful in detail, shows a rich quality of tone and colour. It is largely historical, with much material used from the American Revolution; he produced large groups of figures, well composed and fine in spirit. He has held his way undisturbed, reflecting little of the modern day manner. Dunsmore received his training in France and returned to America to organize the Detroit Art Museum and School. As president of the American Water Color Society for many years, he has given freely of his time to bring the Society to its present high plane.

Henry B. Snell has contributed largely to the art of water-colour painting. His work is beautiful in tone and composition. He most always uses a scrub method for which he is largely responsible, being its leading exponent both in England and in America. His work has great depth of colour and reflects a luminous feeling of light; edges are softened, thereby regaining the decorative sense of paint which was lost in a hard rendering of objective things. Snell was born in Richmond, England, in 1858. He has taught painting for many years and has had a great influence on the artist of the present time. He was one of a younger group of painters who broke away from the American Water Color Society to form the New York Water Color Club.

Arthur B. Davies (1862–1928), and Frank W. Benson were born in the same year; Davies in Utica, N.Y., and Benson in Salem, Mass. Both of these painters have impressed a fine and spontaneous art on this country. Davies' work carries a mystery and romance, not realistic, but filled with atmosphere and beauty of design. Both his landscape and figure groups are noteworthy. He uses nude figures set in a romantic landscape, decorative and with rich, fine colour. Frank W. Benson uses most mediums, but his water-colours have a direct charm and a spontaneity of handling, crisp and rich, and luscious in colour, which is direct water-colour painting at its best.

Childe Hassam (b. 1859) is a painter of many moods and mediums. Water-colour has been his vehicle of spontaneous expression from the beginning of his artistic career, covering a period of forty years. Breadth of colour and an impressionistic manner, broken colour closely tied together and washes beautifully spotted in, tend to give a fine sparkle to his pictures. He was the first president of the New York Water Color Club, organized in 1890, serving six years.

Dodge MacKnight (b. 1860) is noted for his broad treatment and brilliant colouring. He has had a strong influence over Boston painters, tending to loosen the tightness of the Boston school of water-colourists. Reds and violet blues have been dominant notes in his work, running sometimes almost to monochrome, but always saved by a compliment, giving his pictures a brilliant quality.

William Ritschel, born in 1864, in Nuremberg, Germany, has worked through many phases from the older methods of superimposed tone on tone to get depth, to a direct and sparkling wash of broken colour.

Maurice Prendergast (1861–1924) belongs to the same period but his work has been developed and relates to the Persian rather than the Chinese manner, direct in handling but highly imaginative patterns backed by high colour suggesting mosaic glass.

Sigurd Skou, Gifford Beal, Rockwell Kent, John E. Costigan and John R. Koopman have much in common; they use a fast and direct method and are interested in design first and colour second. Possibly Beal thinks more of tonality than the others. George Elmer Browne enters this same group, but with a broader handling of swift, wet colour used simply. Browne has taught painting for many years and has had a decided influence on young American painters. He was educated in Paris. Kent has the most striking sense of design in this group, while Koopman, subjecting colour to a decorative treatment rhythm, plays a strong part in creating this feeling. He paints and draws in water-colour and treats of broken pattern and colour, design translated to pattern, very fresh and rich in handling. Costigan achieves beautiful water-colour handling daringly on smooth paper, with a surety of touch.

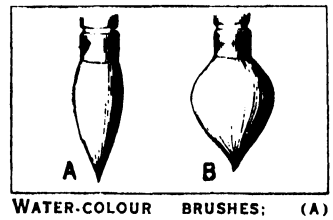
John Marin started from a very conservative form of painting and steadily developed a swift and subjective manner in his late work. Objective things have little place in his scheme. This intense effort to throw off the representative type so dominant for many years and work inward, not outward, causes one to wonder what the ultimate answer will be.

Chauncey Ryder presents another phase, not exactly realistic but rather decorative and free, treating mountains and trees in an extremely simple manner.

Other water-colourists who are enriching the art of the present time are Emerton Heitland, a modern painter in water-colour, brilliant in style; Frank Hazell, who used tempera with force and freedom; J. Scott Williams, who uses clear water-colour with effect; and John Alonzo Williams, who illustrates and paints in a rich manner. John Goss, Emil J. Bistran, Paul Gill and Edward Hopper work in a direct and characteristic way, putting down their impressions with power, keenly observing the salient points of interest and never becoming commonplace. Harley Perkins achieves pattern and colour in an extremely modern way. William J. Aylward, Arthur Beaumont, Roy Brown, Julius Delbos, Lloyd C. Griscom and Frank Tenney Johnson present work of distinction. Charles W. Hawthorne uses water-colour with liquid flowing effects.

George (Pop) Hart and Eugene Higgins search out the heavy, gloomy feeling in life, both painting in a dark, strong manner. Walter Farndon views water-colour as a helper to his oils, sketchy and rather light in colour. Oscar Julius, Wayman Adams, Charles S. Chapman, Alpheous P. Cole, E. Irving Conse, Frederick K. Detwiller, Jonas Lie, George Lawrence Nelson, G. Glenn Newell, Raymond Perry, Arthur E. Powell, Ernest D. Roth, W. Granville Smith, Stanley W. Woodward, Cullen Yates, Frank N. Wilcox, J. Lars Hoftrup and Howard Giles, Gordon Grant and Herbert B. Tschudy represent a few of the many water-colourists of note. Armin Hansen (b. 1886) paints the sea with fine feeling. Ezra Winter uses water-colour to plan and design the decorations which he finally paints in oil or fresco. His work has excellent mural quality; formal design holds a strong place in his field. He uses one of the methods employed by the Pompeians.

William J. Whittemore is a landscape and figure painter who has for many years been a devotee of this medium. His recent work is free and colourful, and has a fine quality. William Starkweather, a vigorous painter, spares no trouble in finding interesting motives, unusual and rich in colour. He is a personage in this field. Harry Vincent, another water-colourist, uses the sea and boats as material to create luscious and fluid combinations of colour. George Walter Dawson, professor of drawing at University of Pennsylvania, is widely known as a water-colourist. J. Olaf Olson and Felicie Waldo Howell are among the younger artists who have shown the great possibilities of water-colour.



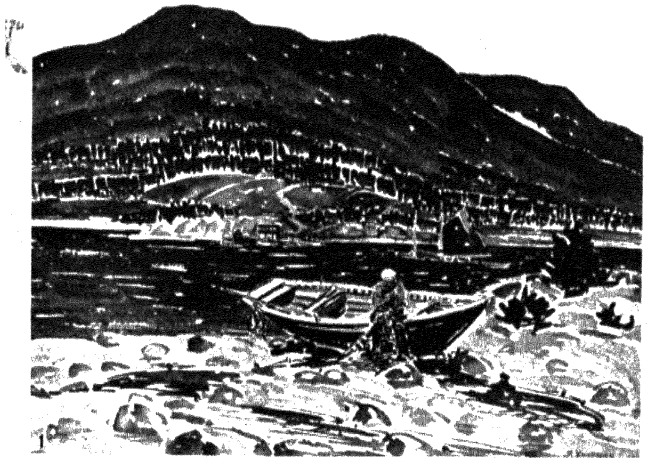
TECHNIQUE

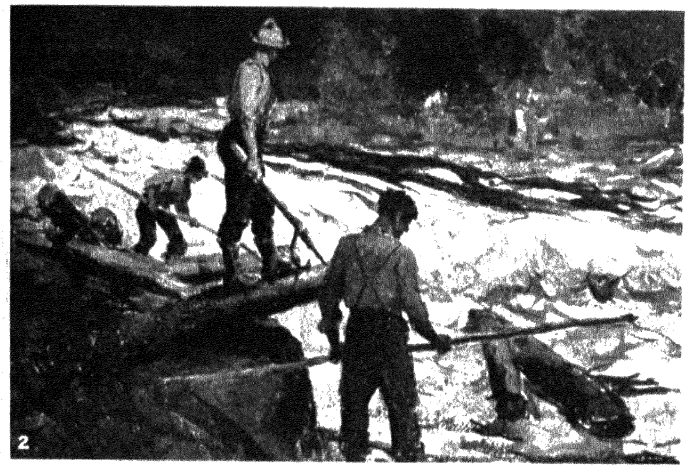
The materials used in painting in water-colour become of prime importance if the richness and purity of colour is to be achieved. This calls for a short but brilliant palette. Seven or eight colours suffice to give the greatest range and flexibility of handling, making it possible for the painter to force the key at any desired area on his paper. The medium must be liquid and free to gain beauty and texture. The artists of the Sung dynasty carried much of the same fresh directness that is being achieved to-day, and they took great care and trouble in the making of their materials. The artist of the present time uses a much more brilliant palette; consequently his troubles increase, as it is doubly important to have all materials of the best.

To begin with, a box to hold the colour is an important matter. It should be convenient, not too large to handle, and be both palette and colour container; it should be a folding box, having preferably two lids, one flat which folds over the first, and then the outer cover which should contain three or four wells or sinks where one can mix colour or gather a pool if there is a large surface to cover.

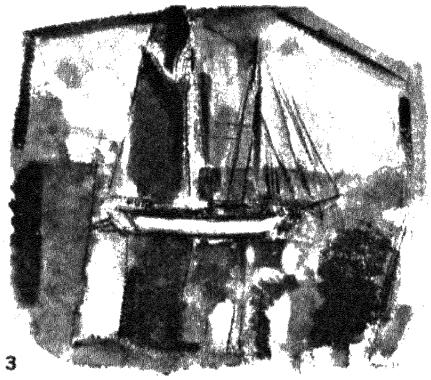
It is wise to procure a separate holder for the brushes and pencil, and to carry the tubes of paint separately. Tube colour is better than pans of colour, because it can be squeezed out as needed and the colour is always fresh, one of the most important factors in this difficult art. With the exception of vermilion, which must have time to set, otherwise it runs throughout the box, the various colours used can be put out when ready to work. So-called pan colour is of little use and is almost always dried out when bought. Tube colour is much more economical, keeps better, and if the cap is put on tight, will not dry out.

The Use and Care of Brushes.—One large brush, red sable, will do the work of five small ones. One No. 10 or No. 12 brush will do the finest or broadest kind of work. It is well to wash the sable in warm water and soap at various times, as the paint rots the hairs. Dip the brush in water and see if it tapers to a fine point, wedge-shaped, almost straight from tin to point, and not curved (*see* figure). A fat, curved brush seldom acts well in handling, and does not last. It becomes a club after the point wears down. Some water-colour artists use three or four different-sized brushes, but the mastery of one brush means considerable progress. The wedge-shaped brush will spread as well as the curved brush, and can be controlled much better. The curved brush kicks up edges and sometimes needlessly separates. The mere matter of holding a brush is very important to the novice in water-colour painting (*see* Plate V.). The Chinese spent years in cultivating the use of their brushes, how to hold them, acquiring a dexterity of handling far beyond that of many of our modern artists. They wrote with the brush and also painted with it, painting with the greatest breadth or with the most exacting minuteness (*see* ART: *Far Eastern Methods*).



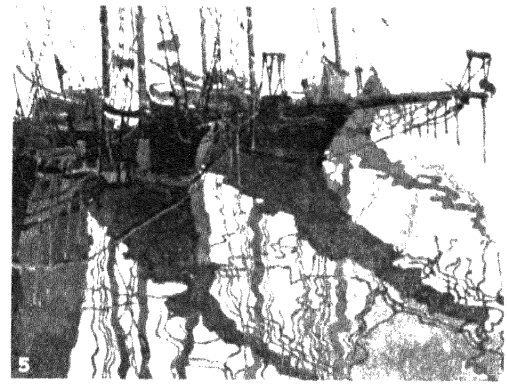


WATER-COLOUR BRUSHES: (A) CORRECT SHAPE, (B) INCORRECT SHAPE



In holding the brush, it is necessary to use not only the fingers but the entire arm and wrist, taking care not to choke the brush by grasping it down close to the tin. When it is held in such a manner, only the fingers operate; the rigid arm means a loss in freedom. The brush should be held as far from the hair as possible, and kept as nearly at a right angle to the paper as possible. This makes for great variety, flexibility, and carries the colour to the paper with dexterity. In taking up colour from the box a charged brush is of supreme importance, whether the colour be pale or of the deepest intensity. A full brush means depth; a thin brush means a tint, and tinting is not, in the fullest meaning of the term, water-colour painting.

A flooded colour, light or dark, has a much greater beauty and vibration. Dark detail can be struck over a lighter mass with a charged brush, without wiping up the colour underneath or disturbing it; when colour is used thinly it loses lustre. The paper should not be held flat, as colour will puddle and not flow as it does when held at a 45° angle; flood-colour helps to give variation and texture, and also better represents light. Just as will be observed in fine stained-glass, the upper edge will be light in colour and the lower edge rich and glowing. The colour should really flow from the brush onto the paper and be luminous, not thin and pasty.



Selection of Colours.—This subject is extensive and full of pitfalls. Naturally, the dealer desires to sell as many different

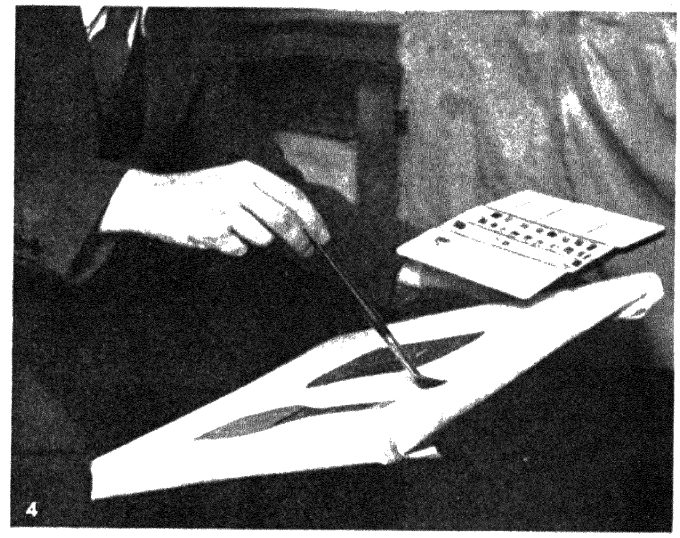
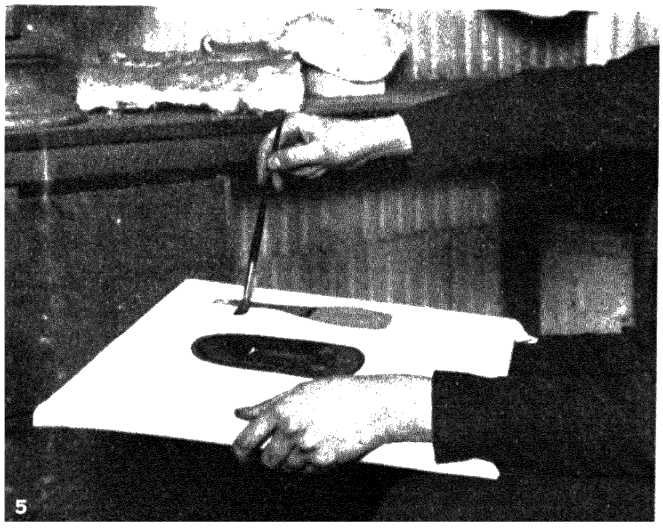
NINETEENTH-CENTURY WATER COLOURS OF EUROPEAN MASTERS



1. Water colour view of Blackburn canal, by Sir Charles John Holmes (1868–); showing interesting structure and composition acquired directly. English
2. "French Landscape," water colour by Henri Harpignies (1819–1916); a delicate and effective treatment involving a certain amount of drawing with the brush. French
3. "Bath of Venus" by Sir Edward Burne-Jones (1833–98); a treatment inappropriate for water-colours. Its necessarily careful modelling loses its spontaneity. English
4. "Don Quixote and Sancho Panza" by Honoré Daumier (1808–79). Masterful example of direct powerful modelling. French



WATER-COLOUR PAINTING

RELATIVE POSITIONS OF PAPER, PAINT BOX AND BRUSH IN WATER COLOUR WORK

1. In applying a wash as is illustrated here, and in fact throughout water-colour painting, the brush should be full of colour which flows easily, and the arm should have a free movement in any direction. 2. In the painting in of detail a brush perpendicular to the painted surface permits movement in any direction. If the brush is slanted and the painter attempts to do a curve such as a circle, it will stutter when it is pushed forward and draw more finely when it is pulled back. 3, 4. The proper method of holding the paint-box and the paper, showing a slight canting of the brush in the direction of the stroke. 5. Some painters prefer the paper to be nearly horizontal, which permits even freer use of the perpendicular brush. Note that the hand is some distance from the ferrule. 6. Showing method of stretching water colour paper on frame

shades and hues of colour as possible. The artist's task is to select exactly the smallest number of colours which will give complete range and effect.

Three primary colours are the first necessity: red, yellow and blue. Three secondary colours complete the range: orange, violet, green. The warm colour scale is comprised in the red, yellow and orange. The complements represent the cool scale. This is the theory of warm and cool colour. If we select a rose madder for our red, an ultramarine blue and a cadmium yellow, this set of three calls for supplementary assistants. The rose madder needs a yellow red, so vermilion is added, as it helps to reach the yellow spectrum. Cobalt blue assists French ultramarine blue and a pale yellow forms the link between yellow and green. The cadmium yellow can be omitted and cadmium pale substituted in its place. Adding green deep, the artist has a complete range of colour, from deep to light and from warm to cool. Cerulean blue will also be found useful.

Water-Colour Palette

Rose Madder	*French Ultramarine Blue*
Vermilion	*Cobalt Blue*
Cadmium Pale	*Hookers Green Deep II.*
Cadmium Yellow	*Cerulean Blue* (a cold blue green)

This palette will be found clear and brilliant and will enable one to paint in a very deep, full-toned manner or in a very pale and high-keyed pitch; it also has the value of being short and easily handled. The three primary colours "carry" the picture, and the remaining colours complete the tone scale and envelop the picture.

Hooker's green, No. 2, has many advantages over other greens, since it is deep, clear, cool, and mixes readily with the other colours of this palette. It will mix with yellows without turning into mud, as most greens do. Cerulean blue melts into ultramarine and cobalt blue, and cools them. When used with vermilion it makes a beautiful grey. It is interesting to put down vermilion and then carry the cerulean to it directly from the box and mix on the paper. This gives a better variety. It also helps to make transparency in the gray, for while vermilion is inclined toward opacity, it clears when the brush is charged and flushed directly into blues. When it is desired to make rose madder flash, cerulean blue can be charged into it in the above manner, but not if the madder has dried.

Of the eight colours above mentioned, six or seven will always be in active use. The water-colourist should resist as much as possible the impulse to work over a tone. If its depth at first is questioned, he should charge the surface again, thereby increasing its weight. It is a wise practice to establish the contrast or deepest notes at the beginning of the picture, saving all light masses, as white paper, until near the finish. This makes optional the matter of holding the contrasting masses or pressing them down with tone or warm light, as the subject may require. Save or spare the whites. Do not dull them. At the finish they can be tinted.

The picture must be carefully planned, drawn as simply as possible, not modeled in pencil or shade, and designed as one would design a pattern, giving due thought to the rhythm of line and mass. When the enveloping process begins, as mentioned earlier, the main masses should be preserved, since this maintains the carrying power. Light or dark masses should not be cut up too much, as this results in chaos and gives the feeling of over-abundance in the picture. When a colour occurs in a mass, say red or blue, let the clear colour flash to the surface somewhere, as that produces light and brilliance. If a red appears in a mass, repeat it again elsewhere in a minor chord. Other colours should reach in like manner. Do not try to over-model clear tones; simply maintain them.

With due consideration for what has been done during the last forty years, it is evident that water-colour painting in its various branches and ways of handling, its brilliancy of colour and flexibility, will return to its right and proper place. (*See* PAINTING.)

Littlejohns, *Technique of Water-Color Painting* (1925); E. B. Lintott, *Art of Water-Color Painting* (1926); David Lloyd, *Water-Colour Painting, Handling, Technique.*

(G. P. E.)

WATER-CRESS (*Nasturtium officinale*), an aquatic salad-plant of the family Cruciferae, native to Europe and Asia, common in Great Britain, widely naturalized in the United States and Canada and introduced also into the West Indies and South America. It is a creeping or floating perennial, rooting in clear, cold water, with leaves composed of few to several small rounded leaflets and elongated clusters of small white flowers. Its slightly pungent flavour is due to an oil containing sulphur. Water-cress is cultivated for the market in shallow ditches, prepared in wet, low-lying meadows, provision being made for flooding at will.

WATER-DEER, *Hydrelaphus inermis*, a small member of the deer-tribe from northern China differing from all other *Cervidae* except the musk-deer (with which it has no affinity) by the absence of antlers in both sexes. To compensate for this the bucks are armed with long sabre-like upper tusks (*see* DEER); a second form, *H. kreyenbergi*, has been distinguished, from Hankow. Water-deer frequent the neighbourhood of the large Chinese rivers, where they crouch amid the reeds and grass. When running, they arch their backs and scurry away in a series of short leaps. This is one of the few deer in which there are glands neither on the hock nor on the skin covering the cannon-bone. These glands probably enable deer to ascertain the whereabouts of their fellows by the scent they leave; but the sub-aquatic habits of the present species render such a function impossible. The tail is a mere stump.

WATERFALL, a point in a watercourse where descent is perpendicular or nearly so. The beauty of a waterfall is dependent on its height rather than on the volume of water. Small but immensely deep falls are common, for a small stream has insufficient power to erode a steady slope, and thus any considerable irregularity of level in its course is marked by a fall. In mountainous districts a stream may descend into the main valley as a "hanging tributary" by way of a fall, its own valley having suffered less erosion than the main valley. The chief cause of a waterfall is a sudden and marked change in geological structure. For example, if a stream crosses a harder stratum it will be able to grade its course through the upstream or downstream soft strata more rapidly than through the intermediate hard stratum, over a ledge of which it will subsequently fall. Such barriers may be produced by the ordinary rock sequence or by an intrusive dyke of basalt, or by glacial deposits. Where a river falls over a shelf of hard rock overlying softer material there is a rapid erosion of the soft rock, with undercutting and consequent collapse of the edge of the hard shelf. In this way, the fall gradually moves upstream and a gorge occurs below it; the Niagara Falls provide an excellent illustration of this process.

WATER-FLEA, a name given by the earlier microscopists (Swammerdam, 1669) to minute aquatic Crustacea (*q.v.*) of the order Cladocera (*q.v.*), but applied also to the smaller members of other groups. The Cladocera are abundant everywhere in fresh water. One of the commonest species, *Daphnia pulex*, found in ponds and ditches, is less than one-tenth of an inch in length and has the body enclosed in a transparent bivalved shell. The head, projecting in front of the shell, bears a pair of branched feathery antennae which are the chief swimming organs and propel the animal, in a succession of rapid bounds, through the water. There is a single large black eye. In the living animal five pairs of leaf-like limbs acting as gills can be observed in constant motion between the valves of the shell, and the pulsating heart may be seen near the dorsal surface, a little way behind the head. The body ends behind in a kind of tail with a double curved claw which can be protruded from the shell. The female carries the eggs in a brood-chamber between the back of the body and the shell until hatching takes place. Throughout the greater part of the year only females occur and the eggs develop "parthenogenetically," without fertilization. When the small males appear, generally in the autumn, fertilized "winter" or "resting eggs" are produced which are cast adrift in a case or "ephippium" formed by a specially modified part of the shell. These resting eggs enable the race to survive the winter or drying of the water. (W. T. C.)

WATERFORD, a county of Ireland in the province of Munster. The area of Waterford is 458,108 acres, or about 716

sq.m. Pop. (1926), exclusive of Waterford City, 51,892. The coast line is in some parts bold and rocky, and is indented by numerous bays and inlets, the principal being Waterford Harbour; Tramore Bay, with picturesque cliffs and extensive caves, and noted for its shipwrecks on account of the rocky character of its bed, Dungarvan Harbour, much frequented for refuge in stormy weather, and Youghal Harbour, partly separating Co. Waterford from Co. Cork. The surface of the country is to a large extent mountainous, providing beautiful inland scenery, especially towards the west and northwest. The Knockmealdown Mountains, which attain a height of 2,609 ft., form the northern boundary with Tipperary. A wide extent of country between Clonmel and Dungarvan is occupied by the two ranges of the Comeragh and Monavallagh Mountains, reaching a height of 2,504 ft.

To the south of Dungarvan there is a lower but very rugged range, called the Drum Hills. The south-eastern division of the county is for the most part level. Though Waterford benefits in its communications by the important rivers in its vicinity, the only large river it can properly claim as belonging to it is the Blackwater. This river is famous for salmon fishing, and, particularly in the stretch between Cappoquin and Lismore, flows between high, well-wooded banks, contrasting beautifully with the background of the mountains. It enters the county east of Fermoy, and flows eastward to Cappoquin, the head of navigation, where it turns abruptly southward, to enter the sea at Youghal Harbour. Waterford Harbour may be called the estuary of three important rivers, the Suir, the Nore and the Barrow, but neither of the last two touches the county. The Suir reaches it about 8 m. from Clonmel, and thence forms its northern boundary with Tipperary and Kilkenny. It is navigable to Clonmel, but the traffic lies mainly on the left bank, outside the county.

Geology.—The Knockmealdown Mountains are an anticline of Old Red Sandstone, cut away at the eastern end to expose Silurian strata, which are associated with an extensive series of volcanic and intrusive rocks, often crushed by earth-movement. The impressive scarp formed by the Old Red Sandstone conglomerate above this lower ground is called the Comeragh Mountains. The moraine-dammed cirque of Lough Coumshingaun lies in these, with a precipice 1,000 ft. in height. The unconformity of the Old Red Sandstone on the greenish and yellowish Silurian shales is excellently seen on the north bank of the Suir at Waterford. Carboniferous Limestone is found in the floor of the synclinals on either side of the great anticline, that is, in the Suir valley on the north, and in the green and richly-wooded hollow of the Blackwater on the south. Rapidly repeated anticlinal and synclinal folds continue this structure across the country between Dungarvan and Youghal. Rich copper-mines were worked, mainly in the 19th century, in the Silurian area near Bonmahon, and the region remains full of mineral promise.

History.—In the 9th century the Danes landed, and afterwards made a permanent settlement. Waterford was one of the twelve counties into which King John is stated to have divided that part of Ireland which he nominally annexed to the English crown. On account of the convenience of the city as a landing place, many subsequent expeditions passed through the county. In 1444 the greater part of it was granted to James, earl of Desmond, and in 1447 it was bestowed on John Talbot, earl of Shrewsbury, who was created earl of Waterford. The county suffered severely during the Desmond rebellion, in the reign of Elizabeth, as well as in the rebellion of 1641 and during the Cromwellian period. At Ardmore, overlooking the sea from Ram Head, there is a round tower 95 ft. in height, and near it a huge rath and a large number of circular entrenchments. Lismore castle, originally erected in 1185, is in great part comparatively modern. The chief ecclesiastical remains are those of the chancel and nave of the cathedral of Ardmore, where a monastery and oratory were founded by St. Declan in the 7th century. The see of Ardmore was abolished in the 12th century. Here are also remains of a church and oratory, and a holy well. Mention should be made of the existing monastery of Mount Melleray, a convent of Trappists founded near Cappoquin in 1830, on the expulsion of the foreign members of this order from France. Schools, both free and boarding, are maintained; and there is a branch of the order at Roscrea (co. Tipperary).

Industries.—Of the 23,343 gainfully employed in 1926, 13,523 or 58% were farmers. The land is generally better for pasturage than for tillage, although there are considerable tracts of rich soil in the south-eastern districts. In 1926 13·9% of the land was ploughed, as compared with 34·6% in 1851. There were 43,391 ac. in crops, 26,391 ac. in hay and 243,026 ac. in pasture. The crop acreage has decreased from 69,360 in 1918. Of the crop acreage slightly over half was planted to corn crops, mostly oats (23,211 ac.), and slightly less than half to root and green crops. Of the latter potatoes, turnips and mangels were the most important. The size of farm holdings in the county average larger than for Ireland in general. The county ranked second among Irish counties in 1926 in the number of its cattle. The numbers of cattle, sheep and poultry increase steadily, and pigs are extensively reared. The woollen manufacture, except for home use, is practically extinct, but the cotton manufacture is still of some importance. There are a number of breweries and distilleries and also a large number of flour-mills. The deep sea and coast fisheries have their headquarters at Waterford, and the salmon fisheries of the Suir and Blackwater have theirs at Waterford and Lismore respectively. Railway communication is provided by the Great Southern railway. Waterford returns 4 members to Dáil Eireann.

WATERFORD, the chief town of co. Waterford, Ireland. Pop. (1926) 26,646. It is situated on the Suir 4 m. above its junction with the Barrow at the head of the tidal estuary called Waterford Harbour. The Suir is crossed by a wooden bridge of 39 arches, and 832 ft. long, connecting Waterford with the suburb of Ferrybank.

Anciently Waterford was called *Cuan-na-groith,* the haven of the sun. By early writers it was named Menapia. It first acquired importance under the Danes, of whom it remained one of the principal strongholds until its capture by Strongbow in 1171. In 1172 Henry II. landed near Waterford, and received here the hostages of the people of Munster. It became a cathedral city in 1096. The Protestant dioceses of Cashel, Emly, Waterford and Lismore were united in 1833. John landed at Waterford in 1185. After ascending the English throne he granted it a fair in 1204, and in 1206 a charter of incorporation. He landed at Waterford in 1210, in order to establish within his nominal territories in Ireland a more distinct form of government. The city received a new charter from Henry III. in 1232. Richard II. landed at Waterford in Oct. 1394 and again in 1399. In 1447 it was granted by Henry VI. to John Talbot, earl of Shrewsbury, who was created earl of Waterford. In 1497 it successfully resisted an attempt of Perkin Warbeck to capture it, in recognition of which it received various privileges from Henry VII.

In 1603, after the accession of James I. to the English crown, the city, along with Cork, took a prominent part in opposition to the Government and to the Protestant religion, but on the approach of Mountjoy it formally submitted. From this time, however, the magistrates whom it elected refused to take the oath of supremacy, and, as by its charter it possessed the right to refuse admission to the king's judges, and therefore to dispense with the right of holding assizes, a rule was obtained in the Irish chancery for the seizure of its charter, which was carried into effect in 1618. In 1619 an unsuccessful attempt was made to induce Bristol merchants to settle in the city and undertake its government, and in 1626 the charter was restored. The city resisted Cromwell in 1649, but surrendered to Ireton in 1650. After the battle of the Boyne James II. embarked at it for France (July 1690). Shortly afterwards it surrendered to William, who sailed from it to England. It sent two members to parliament from 1374 to 1885, when the number was reduced to one. In 1898 it was constituted one of the six county boroughs having separate county councils.

The city is built chiefly along the banks of the river, occupying for the most part low and level ground except at its western extremity. The modern Protestant cathedral of the Holy Trinity,

generally called Christ Church, occupies the site of the church built by the Danes in 1096, in the Mall. Near it are the episcopal palace and deanery. There is a Roman Catholic cathedral, and St. John's college, a training seminary for priests. The principal secular buildings are the town-hall, the county and city courts and prisons, the custom-house and the barracks. At the extremity of the quay is a large circular tower, called Reginald's tower, forming at one time a portion of the city walls, and occupying the site of the tower built by Reginald the Dane in 1003. Other remains of the fortifications, consisting of towers and bastions, are to be seen as in the Tramore railway sidings and in Castle street. The leper house, founded in the reign of King John, is now used practically as an infirmary. The town possesses breweries, salt-houses, foundries and flour mills; and there is a large export trade in cattle, sheep and pigs, and in agricultural produce. It is the headquarters of extensive salmon and sea fisheries. Waterford is second in importance to Cork among the ports of the south coast of Ireland. There is regular communication by steamer with Cork, with Dublin and Belfast, with Fishguard and with many English ports.

Waterford harbour is a winding and well-sheltered bay formed by the estuary of the river Suir, and afterwards by the joint estuary of the Nore and Barrow. Its length to the sea is about 15 miles. Its entrance is 3 m. wide, and is lighted by a fixed light on the ancient donjon of Hook Tower (139 ft. in height) and others. The natural harbour is formed by the Suir from Waterford to its confluence with the Barrow and thence to the sea, a distance of 18 miles. The entrance is 3 m. wide. The Suir is navigable to Waterford for vessels drawing 22 ft. The shores of the harbour are studded with country residences and waterside villages, of which Passage and Duncannon are popular resorts of the citizens of Waterford.

See C. Smith's *Antient and Present State of the County and City of Waterford* (1746); R. H. Ryland, *Topography and Antiquities of the County and City of Waterford* (1824); P. M. Egan, *Guide to Waterford* (1896); Power, *Parochial History of the Diocese of Waterford and Lismore* (1912); E. Downey, *The Story of Waterford* (1914).

WATERFORD, a village of Saratoga county, New York, U.S.A., on the west bank of the Hudson river, near the mouth of the Mohawk river, and about 10 miles north of Albany. The population decreased from 3,225 in 1910 to 2,637 in 1920. Waterford is served by the Delaware and Hudson railway, and is at the junction of the Erie and the Champlain divisions of the great barge canal connecting Lake Erie and Lake Champlain with the Hudson river. There was a settlement here probably as early as 1630, and Waterford was laid out in 1784, and was incorporated as a village in 1794.

WATER GAS. When steam is passed over red-hot anthracite or coke it is decomposed, and the resultant gas, consisting of a mixture of hydrogen and carbon monoxide, is termed water gas. Enriched with gas from cracked oil, it is termed carburetted water gas and is largely employed in industrial operations. It is also used mixed with coal gas for town purposes; when so employed it increases the poisonous character of the gas supply owing to the peculiarly dangerous qualities of carbon monoxide. For full details *see* GAS MANUFACTURE and FUEL.

WATER-GLASS. A common name for sodium silicate, made by fusing together in a furnace soda ash and clean sand. The name water-glass (or soluble glass) is derived from the fact that while the substance resembles glass it can be dissolved in water by prolonged exposure. The proportions of soda and silica in water-glass may be considerably varied, according to the purpose for which it is required. (*See* ALKALI.)

WATER HEMLOCK, also known as cow-bane, is botanically *Cicuta virosa,* a poisonous weed found growing at the edges of ponds, ditches and rivers in Great Britain. It is a perennial plant of the family Umbelliferae, and has large compound leaves and small white flowers appearing from July to August. It has been mistaken by human beings for celery, with fatal results, and is responsible for the death of cattle. In North America there are six native species of *Cicuta,* all similarly poisonous, especially the spotted cow-bane or musquash-root (*C. maculata*) of the eastern States and Canada, and the western water hemlock (*C. Douglasii*) of the Pacific coast. Before its virulence became known to cattle-raisers the western species caused serious losses of live stock in Oregon and other north-western States.

THE WATER HEMLOCK (CICUTA MACULATA), A HERB FOUND IN SWAMPS AND LOW LANDS

The closely allied poison hemlock (*Conium maculatum*) is a biennial plant of the family umbelliferae, found wild in many parts of Great Britain and Ireland, where it occurs in waste places on hedge-banks, and by the borders of fields, and also widely spread over Europe and temperate Asia, and naturalized in the cultivated districts of North and South America. It is an erect branching plant, growing from 3 to 6 ft. high, and emitting a disagreeable smell, like that of mice. The stems are hollow, smooth, somewhat glaucous green, spotted with dull dark purple, as alluded to in the specific name, *maculatum.* The root-leaves have long furrowed footstalks, sheathing the stem at the base, and are large, triangular in outline, and repeatedly divided or compound, the ultimate and very numerous segments being small, ovate and deeply incised at the edge. These leaves generally perish after the growth of the flowering stem, which takes place in the second year, while the leaves produced on the stem became gradually smaller upwards. The branches are all terminated by compound many-rayed umbels of small white flowers, the general involucres consisting of several, the partial ones of about three short lanceolate bracts, the latter being usually turned towards the outside of the umbel. The flowers are succeeded by broadly ovate fruits, the mericarps (half-fruits) having five ribs which, when mature, are waved or crenated; and when cut across the albumen is seen to be deeply furrowed on the inner face, so as to exhibit in section a reniform outline. The fruits when triturated with a solution of caustic potash evolve a most unpleasant odour.

WATERHOUSE, ALFRED (1830–1905), English architect, was born at Liverpool on July 19, 1830, and died on Aug. 22, 1905. He was a pupil of Richard Lane in Manchester. His earliest commissions were of a domestic nature, but his position as a designer of public buildings was assured as early as 1859 when he won the open competition for the Manchester assize courts. This work marked him not only as an adept in the planning of a complicated building on a large scale, but also as a champion of the Gothic cause. In 1868 he won the competition for the Manchester town-hall, where he showed a firmer and perhaps more original handling of the Gothic manner. The same year brought him the rebuilding of part of Caius College, Cambridge, not his first university work, for Balliol, Oxford, had been put into his hands in 1867. At Caius, out of deference to the Renaissance treatment of the older parts of the college, the Gothic element was intentionally mingled with classic detail, while Balliol and Pembroke, Cambridge, which followed in 1871, may be looked upon as typical specimens of the style of his mid career —Gothic tradition (European rather than British) tempered by individual taste and by adaptation to modern needs. Girton College, Cambridge, a building of simpler type, dates originally from the same period (1870), but has been periodically enlarged by further buildings. Two important domestic works were undertaken in 1870 and 1871 respectively—Eaton Hall for the duke, then marquis, of Westminster, and Heythrop Hall, Oxfordshire, the latter, a restoration, being of a fairly strict classic type. Iwerne Minster for Lord Wolverton was begun in 1877. In 1865 Waterhouse had removed his practice from Manchester to London, and he was one of the architects selected to compete for the Royal Courts of Justice. He received from the government, without competition, the commission to build the Natural History Museum, South Kensington, a design which marks an epoch in the modern use of terra-cotta. The new University Club—a

Gothic design—was undertaken in 1866, to be followed nearly twenty years later by the National Liberal Club, a study in Renaissance composition. Waterhouse's series of works for Victoria University, of which he was made LL.D. in 1895, date from 1870, when he was first engaged on Owens College, Manchester. Yorkshire College, Leeds, was begun in 1878; and Liverpool University College in 1885. St. Paul's School, Hammersmith, was begun in 1881, and in the same year the Central Technical College in Exhibition Road, London. Waterhouse's chief remaining works in London are the new Prudential Assurance Company's offices in Holborn; the new University College Hospital; the National Provincial Bank, Piccadilly, 1892; the Surveyors' Institution, Great George Street, 1896; and the Jenner Institute of Preventive Medicine, Chelsea, 1895. For the Prudential Company he designed many provincial branch offices, while for the National Provincial Bank he also designed premises at Manchester. The Liverpool Infirmary is Waterhouse's largest hospital; and St. Mary's Hospital, Manchester, the Alexandra Hospital, Rhyl, and extensive additions at the general hospital, Nottingham, also engaged him. Among works not already mentioned are the Salford gaol; St. Margaret's School, Bushey; the Metropole Hotel, Brighton; Hove town-hall; Alloa town-hall; St. Elizabeth's church, Reddish; the Weigh House chapel, Mayfair; and Hutton Hall, Yorks.

Waterhouse became a fellow of the Royal Institute of British Architects in 1861, and president from 1888 to 1891. In 1878 he received the royal gold medal of the institute, and was made an associate of the Royal Academy, becoming a full member in 1885 and treasurer in 1898. He became a member of the academies of Vienna (1869), Brussels (1886), Antwerp (1887), Milan (1888) and Berlin (1889), and a corresponding member of the Institut de France (1893). After 1886 he was constantly called upon to act as assessor in architectural competitions, and was a member of the international jury appointed to adjudicate on the designs for the west front of Milan Cathedral in 1887. In 1890 he served as architectural member of the Royal Commission on the proposed enlargement of Westminster Abbey as a place of burial. From 1891 to 1902, when he retired, his work was conducted in partnership with his son, Paul Waterhouse.

See Memoir in *The Builder*, Aug. 1905.

WATERHOUSE, GEORGE ROBERT (1810–1888), English naturalist, was born at Somer's Town on Mar. 6, 1810. He was educated as an architect and for a time followed his profession with great success. His real taste, however, was for entomology. In 1833 he and Frederick W. Hope founded the Entomological Society of London and Waterhouse was made honorary curator and later president. He wrote the natural history articles for Knight's *Penny Cyclopaedia*. In 1835 he became curator of the museum of the Royal Institution at Liverpool, giving this up in 1836 for the curatorship of the Zoological Society of London. He made a catalogue of the mammals in the society's museum which was published in 1838 and followed by a supplement in 1839. He declined an invitation to accompany Darwin on the famous voyage of the "Beagle," but on its return Darwin placed the mammals and the coleoptera collected on the voyage with Waterhouse for description. In 1843 he was appointed an assistant in the mineralogical branch of the department of natural history of the British Museum. Of this branch he became keeper in 1851, but in 1857 was transferred to keeper of the department of geology, which post he held until his retirement in 1880. He died at Putney on Jan. 21, 1888.

His special studies were on coleoptera and on the group Heteromera. He began in 1844 a *Natural History of the Mammalia* of which two volumes (1846–1848), treating of the Marsupialia and Rodentia, were published when the publisher found himself unable to continue the work. Waterhouse published also a *Catalogue of British Coleoptera* (1858), and contributed some 120 papers to various scientific journals. He was an indefatigable collector and greatly enriched the museums of which he was curator.

WATERHOUSE, JOHN WILLIAM (1847–1917), English painter, was the son of an artist, by whom he was mainly trained. As a figure-painter he shows in his work much imaginative power and a very personal style, and his pictures are for the most part illustrations of classic myths treated with attractive fantasy. He was an able draughtsman and a fine colourist. He was elected an A.R.A. in 1885 and R.A. in 1895. Four of his paintings. "Consulting the Oracle," "St. Eulalia," "The Lady of Shalott" and "The Magic Circle," are in the National Gallery of British Art. He died in London on Feb. 10, 1917.

See A. L. Baldry, "J. W. Waterhouse and his Work," *Studio*, vol. iv. (1894).

WATER-HYACINTH (*Eichhornia crassipes*), an aquatic herb of the pickerel-weed family (Pontederiaceae), native to tropical America and widely naturalized in warm regions. It is an emersed or floating somewhat fleshy plant, bearing smooth, nearly round, erect leaves, ½ in. to 6 in. broad, and loose clusters of pale violet, orchid-like flowers, marked with blue and yellow. The bladder-like bases of the leaf-stalks serve as floats which keep the plant high in the water. Escaping from cultivation, it has become a troublesome weed, impeding navigation in the inland waters of many warm countries, as Florida, Java, Argentina and Australia.

WATERLAND, DANIEL (1683–1740), English theologian, was born at Walesby on Feb. 14, 1683. He was educated at Magdalene College, Cambridge, of which he was made a fellow in 1704 and master in 1713. He graduated M.A. in 1706 and B.D. in 1714. On Nov. 14, 1715 he became vice-chancellor of the University and in the following year was appointed chaplain in ordinary to the king. In 1720 he published *Eight Sermons in Defence of the Divinity of our Lord Jesus Christ*, preached by him in St. Paul's Cathedral. In 1722 he was appointed Chancellor of the diocese of York, and in 1723 appeared his *Critical History of the Athanasian Creed*. He resigned his London rectory in 1730 when he became archdeacon of Middlesex and vicar of Twickenham. His other major works were *Scripture Vindicated* (1730–32), a reply to Matthew Tindal's *Christianity as Old as Creation; The Importance of the Doctrine of the Holy Trinity Asserted* (1734); and *Review of the Doctrine of the Eucharist* (1737). His work did much to check the increase of latitudinarian ideas within the church of England at the time. His wide learning and command of English and his dispassionate reasoning made him formidable in controversy. He died on Dec. 23, 1740.

WATER-LETTUCE (*Pistia Stratiotes*), an aquatic plant of the arum family (Araceae, *q.v.*), very widely distributed in tropical and subtropical regions; in the United States it is native to slow streams from Florida to Texas. It is a tender, floating perennial, rarely becoming anchored by its long feathery roots. The wedge-shaped, light-green leaves form a rosette, about 6 in. broad, which is somewhat similar to a half-grown lettuce plant before the head is formed. In the cup-like centre of the rosette are borne the small white flowers. The water-lettuce is often grown in water gardens and as an aquarium plant.

WATER-LILY, a name somewhat vaguely given to almost any floating plant with conspicuous flowers, but applying more especially to the species of *Nymphaea, Nuphar,* and other members of the family Nymphaeaceae. These are aquatic plants with thick fleshy rootstocks or tubers embedded in the mud, and throwing up to the surface circular shield-like leaves, and leafless flower-stalks, each terminated by a single flower, often of great beauty, and consisting of four or five sepals, and numerous petals gradually passing into the very numerous stamens without any definite line of demarcation between them. The ovary consists of numerous carpels united together and free, or more or less embedded in the top of the flower-stalk. The ovary has many cavities and is surmounted by a flat stigma of many radiating rows as in a poppy. The fruit is berry-like, and the seeds are remarkable for having their embryo surrounded by an endosperm as well as by a perisperm. The leaf-stalks and flower-stalks are traversed by longitudinal air-passages, whose disposition varies in different species. The species of *Nymphaea* are found in every quarter of the globe. Their flowers range from white to rose-coloured, yellow and blue. Some expand in the evening only,

WATER-LILIES

PAINTED FOR THE ENCYCLOPÆDIA BRITANNICA BY HELEN DAMROSCH TEE-VAN

COMPOSITE GROUP OF NATURAL AND CULTIVATED WATER-LILIES

1. East Indian lotus (*Nelumbium nelumbo*)
2. Formosa water-lily (*Nymphaea formosa*)
3. (*Nymphaea zanzibariensis*)
4. Rice-field water-lily (*Nymphaea odorata gigantea*)
5. Spotted Marliac (*Nymphaea marliacea rubra punctata*)
6. *Nymphaea* Mrs. C. W. Ward
7. *Nymphaea Sioux*
8. *Nymphaea Manzoniello*
9. *Nymphaea Daubeniana*
10. *Nymphaea* Robert A. Harper
11. *Nymphaea odorata sulphurea grandiflora*
12. Blue Egyptian lotus (*Nymphaea caerulea*)
13. *Nymphaea* George Huster
14. Royal water-lily (*Victoria regia*)

others close soon after noon. *Nymphaea alba* is common in some parts of Great Britain, as is also the yellow *Nuphar luteum* (*Nymphaea lutea*). The seeds and the rhizomes contain an abundance of starch, and are used in some places for food.

Nymphaea odorata, fragrant water-lily, and *N. tuberosa,* tuberous water-lily, are the conspicuous white water-lilies of eastern North America; *Nuphar advenum* is the common yellow water-lily or spatter-dock of the eastern States and Canada and *N. polysepalum,* Indian pond-lily, is its counterpart on the Pacific coast; *Brasenia Schreberi,* the water-shield, with small yellow flowers, occurs across the continent.

Under the general head of water-lily are included the lotus of Egypt, *Nymphaea Lotus,* and the sacred lotus of India and China, *Nelumbium speciosum,* formerly a native of the Nile, as shown by Egyptian sculptures and other evidence, but no longer found in that river. *Nelumbium luteum,* of the eastern United States, is the American lotus or water chinquapin (*q.v.*). The gigantic *Victoria regia,* with leaves 6 to 7 ft. in diameter and flowers 8 to 16 in. across, also belongs to this group. It grows in the backwaters of the Amazon, often covering the surface for miles: the seeds are eaten under the name water maize.

WATERLOO, a city of eastern Iowa, U.S.A., on the Cedar river, about 90 m. west of Dubuque and 275 m. west of Chicago. Pop. (1920) 36,230 (90% native white); 1928 local estimate 40,000. It is in a rich farming and stock-raising region, and is headquarters of the Dairy Cattle Congress and the National Belgian Horse Show. Among the manufactures are tractors, engines and dairy separators. The number of manufacturing establishments in 1925 was 95, the number of wage earners 4,205, the value of products $42,202,975 of which $14,495,811 was added by the various manufacturing processes. The river here is 700 to 900 ft. wide; its clear water flows over a limestone bed through a rather evenly sloping valley in the middle of the city with enough fall to furnish valuable water power. The city is served by the Illinois Central (which has large construction and repair shops here), the Chicago, Rock Island and Pacific and the Chicago Great Western. The city was founded about 1846, laid out in 1854, and chartered in 1868. It doubled its population between 1890 and 1900, more than doubled it between 1900 and 1910 and increased it 36% between 1910 and 1920.

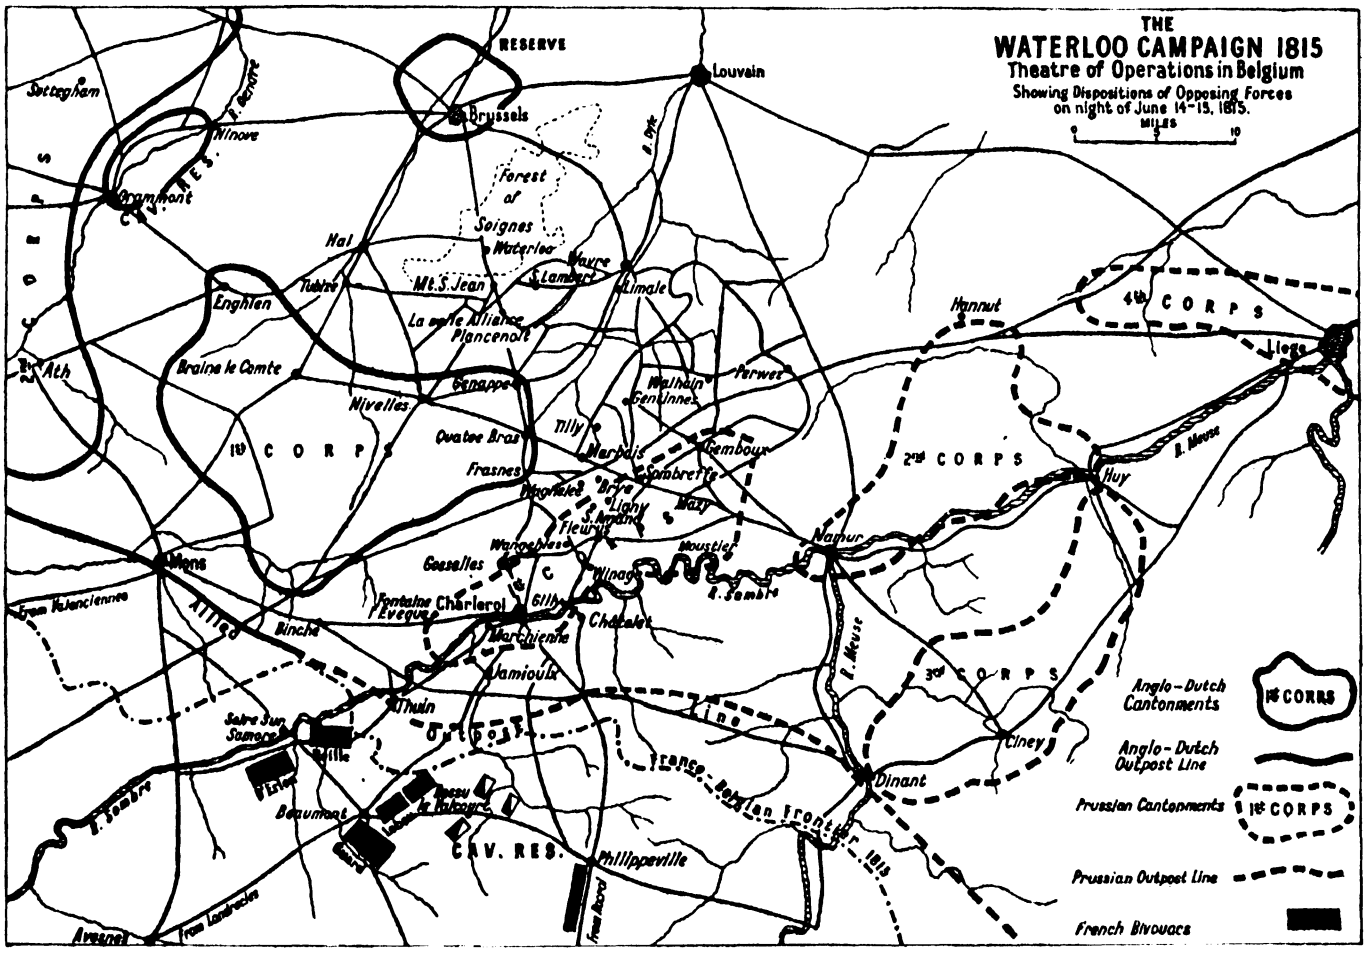
WATERLOO CAMPAIGN, 1815. On Feb. 27, 1815, Napoleon set sail from Elba with a force of 1,000 men and 4 guns, determined to reconquer the throne of France. On March 1 he landed near Cannes, and proceeded at once to march on Paris. He deliberately chose the difficult route over the French Alps because he recognized that his opponents would neither expect him by this route nor be able to exert combined operations in time to thwart him. Events proved the wisdom of his choice. His advance was a series of triumphs, his power waxing with every league he covered, and when he reached Paris the Bourbons had fled. But he had soon to turn his attention to war. His sudden return far from widening the breaches between the allies had fused them indissolubly together, and the four powers bound themselves to put 150,000 men apiece under arms and to maintain them in the field until Napoleon had been utterly crushed. To oppose their vast armies, Napoleon only had in March the 150,000 men he had taken over when Louis XVIII. hurriedly quitted the throne. Within ten days the emperor could have concentrated 50,000 men and struck straight at the small allied forces then in Belgium. But he wisely refrained from taking the immediate offensive. Such action could lead to no decisive result; and Napoleon therefore hastened forward the organization of an army with which to confront the Seventh Coalition. Meanwhile he sought by various means to detach Great Britain and Austria from the alliance.

Napoleon's Preparations and Plans.—By June 1 Napoleon had got together an army of 360,000 for the defence of France, one half of which was available for field service. In this army was comprised his whole means of defence; for he had no allies. On his return from Elba it is true Murat, the king of Naples, took his side; but recklessly opening an offensive campaign, Murat was beaten at Tolentino (May 2–3), and he found himself compelled to fly in disguise to France, where the emperor refused to give him an audience or employment. Napoleon thus deprived himself of the most brilliant cavalry soldier of the period and left the whole eastern frontier of France open to invasion. The country, too, was weakened by internal dissensions at the very moment when it was necessary to put every man in line to meet the rising tide of invasion.

In Belgium lay an ever-increasing force of Anglo-Dutch and Prussian troops under Wellington and Blücher. The eastern frontier was threatened by Austrian armies, and the Russians were slowly coming up. The allies determined to avoid any risk of defeat in detail. It was arranged that Wellington and Blücher should await in Belgium the arrival of the Austrians and Russians on the Rhine. Then about July 1 the general invasion of France would be begun. Affording each other mutual support, the allies would press forward on Paris, and, after defeating Napoleon, drive him within its works. This menacing danger forced Napoleon to strike prematurely, for he determined to crush Wellington and Blücher, whose forces lay dispersed in Belgium, before the Austrians and Russians poured across the eastern frontier.

In the early days of June Wellington and Blücher were disposed as follows. (*See* map.) The Anglo-Dutch Army, 93,000, headquarters at Brussels, were cantoned: I. Corps (Prince of Orange), 30,200, in the area Enghien-Genappe-Mons; II. Corps (Lord Hill), 27,300, in the area Ath-Audenarde-Ghent; reserve cavalry (Lord Uxbridge), 9,900, in the Dendre valley; whilst the reserve (Wellington), 25,500, lay around Brussels. The front was watched by Dutch-Belgian light cavalry.

Blücher's Prussian Army, 116,000, headquarters at Namur, were quartered: I. Corps (Zieten), 30,800, along the Sambre covering Fontaine l'Evêque-Heurus-Moustier; II. Corps (Pirch), 31,800, in the area Namur-Hannut-Huy; III. Corps (Thielemann), 23,900, in the bend of the Meuse from Dinant to Huy; IV. Corps (Bülow), 30,300, around Liége. The front was watched by the Prussian outposts.



Thus the allied cantonments extended for nearly 90 m. and their mean depth was 30 m. To concentrate on either flank would take six days, and on the common centre, Charleroi, three days.

The allies had foreseen the very manoeuvre that Napoleon decided to adopt, and if an attempt was made to break their centre they intended to concentrate forwards and on their inner flanks, the Anglo-Dutch at Gosselies and the Prussians at Fleurus. They could then act united against Napoleon with a numerical superiority of two to one. They felt certain they would obtain the necessary three days' warning of the French concentration, as Napoleon's troops were then distributed between Lille, Metz and Paris (175 m. by 100 m.). To concentrate the French army, within striking distance of Charleroi, before the allies had moved a man to meet it was unthinkable. But it was the unthinkable that happened.

Whereas Blücher had covered Fleurus by Zieten's Corps, which by a yielding fight would secure the time for the Prussian concentration, yet Wellington had only covered Gosselies by a cavalry screen which was too weak to gain the time requisite for the Duke to mass there. Hence to enable him to concentrate as arranged Wellington relied on obtaining timely information of Napoleon's plans, which in fact he failed to obtain.

The French Concentration.—The emperor made his final preparations with the utmost secrecy. The "Armée du Nord" was to concentrate in three columns—around Solre, Beaumont and Philippeville—as close to Charleroi as was practicable. On June 6 the IV. Corps (Gérard) started and soon the whole army was in motion, every effort being made to hide the movements of the troops, for there was no great natural screen to cover the strategical concentration. On June 11 Napoleon left Paris for the front, and by June 14 he had achieved almost the impossible itself. There around Solre, Beaumont, and Philippeville lay his mass of men, 124,000, concentrated under his hand and ready to march across the frontier at dawn against the unsuspicious enemy. The allies still lay in widely distant cantonments and they had not moved a man to meet the foe.

The opposing armies were of very different quality. Welling-

ton's was a collection of many nationalities, and the kernel of British and King's German Legion troops numbered only 42,000. Blücher's army was undoubtedly more homogeneous and included no specially weak elements. Napoleon led out a veteran army of Frenchmen who worshipped their leader. But there were lines of weakness in his force. For various reasons, neither Davout, Murat, Suchet, nor Clausel were employed in the "Armée du Nord." Marshal Soult, appointed chief of the staff, possessed few qualifications for this post; and neither Ney nor Grouchy who, when the campaign began were given command of the left and right wings, possessed the ability or strategic skill necessary for such positions. Again the army was morally weakened by a haunting dread of treason; and, finally, it was too small for its purpose. Locked up in secondary theatres Napoleon had left 56,500 men, of whom he might have collected over 30,000 for the decisive campaign in Belgium. Had he concentrated 155,000 of his available force opposite to Charleroi on June 14, then the issue would hardly have been in doubt. As it was he left too much to Fortune.

For his advance into Belgium in 1815 Napoleon divided his army into two wings and a reserve. As the foe would lie away to his right and left front after he had passed the Sambre, one wing would be pushed up towards Wellington and another towards Blücher; whilst the mass of the reserve would be centrally placed so as to strike on either side, as soon as a force of the enemy worth destroying was encountered and gripped. To this end he had, on the 14th, massed his left wing (Reille and D'Erlon) around Solre, and his right wing (Gérard) at Philippeville; whilst the central mass (Vandamme, Lobau, the Guard and the Cavalry Reserve) lay around Beaumont. The orders for the French advance next day, among the finest ever issued, directed that the army should march at dawn and move to the Sambre at Marchienne and Charleroi. By evening it was expected that the whole would have crossed the Sambre, and would bivouac between the sundered allies.

The Passage of the Sambre.—At the very outset delays occurred. Vandamme, who was to lead the advance on Charleroi, was delayed by an accident that befell the single orderly who carried the orders to the III. Corps. Gérard, too, was late as his concentration had not been completed on the 14th. Zieten's outposts fought stubbornly to delay the French advance for 24 hours and give time for Blücher's concentration. As soon as the emperor reached the front he took vigorous action, nevertheless it was after noon before the Charleroi bridge was stormed. At the same time Reille crossed at Marchienne. The emperor at once began the advance up both the Fleurus and Quatre Bras roads. It was 3 P.M. when Marshal Ney joined the army and was at once given command of the left wing. Napoleon then proceeded with Grouchy to reconnoitre the Prussian position at Gilly, and, handing over the command of the right wing to the marshal, the emperor immediately returned to Charleroi and ordered Vandamme to go to the assistance of Grouchy.

The allies had been caught unprepared. But as soon as Blücher got the first real warning of imminent danger he ordered the immediate concentration of his army at Sombreffe. Unfortunately, the orders sent to Bülow were so hazy that Bülow did not realize the need for any special haste. Thus the IV. Corps was neutralized until after the 16th. But Pirch I. and Thielemann acted with satisfactory promptness and their corps reached Mazy and Namur by nightfall. Blücher in pursuance with his plan moved to Sombreffe.

Wellington's position at night was hardly safe or even satisfactory. It was not until 3 P.M. that definite news of the French advance reached Brussels, and even then the duke was not certain of the direction of Napoleon's main stroke. Consequently he ordered his divisions to concentrate at their alarm-posts and await further orders. The danger of Blücher's position was thus enormously increased. The allies do not appear to have decided upon the course to be taken in case they were surprised, and their system of inter-communication was most imperfect. Luckily

Wellington's subordinates at the critical point acted with admirable boldness. Prince Bernard, commanding the brigade at Quatre Bras, retained his position there to check the French advance instead of drawing off to mass with his division at Nivelles. His immediate superiors approved his action. Owing to these officers Wellington retained possession of the important strategical point of Quatre Bras. Consequently Ney's advance struck into Prince Bernard's advanced troops who were forced back. But Prince Bernard firmly held his main position at the cross-roads; and, as the day was drawing on, Ney wisely decided not to push on any farther and so risk isolating the left wing. He halted and reported to the emperor.

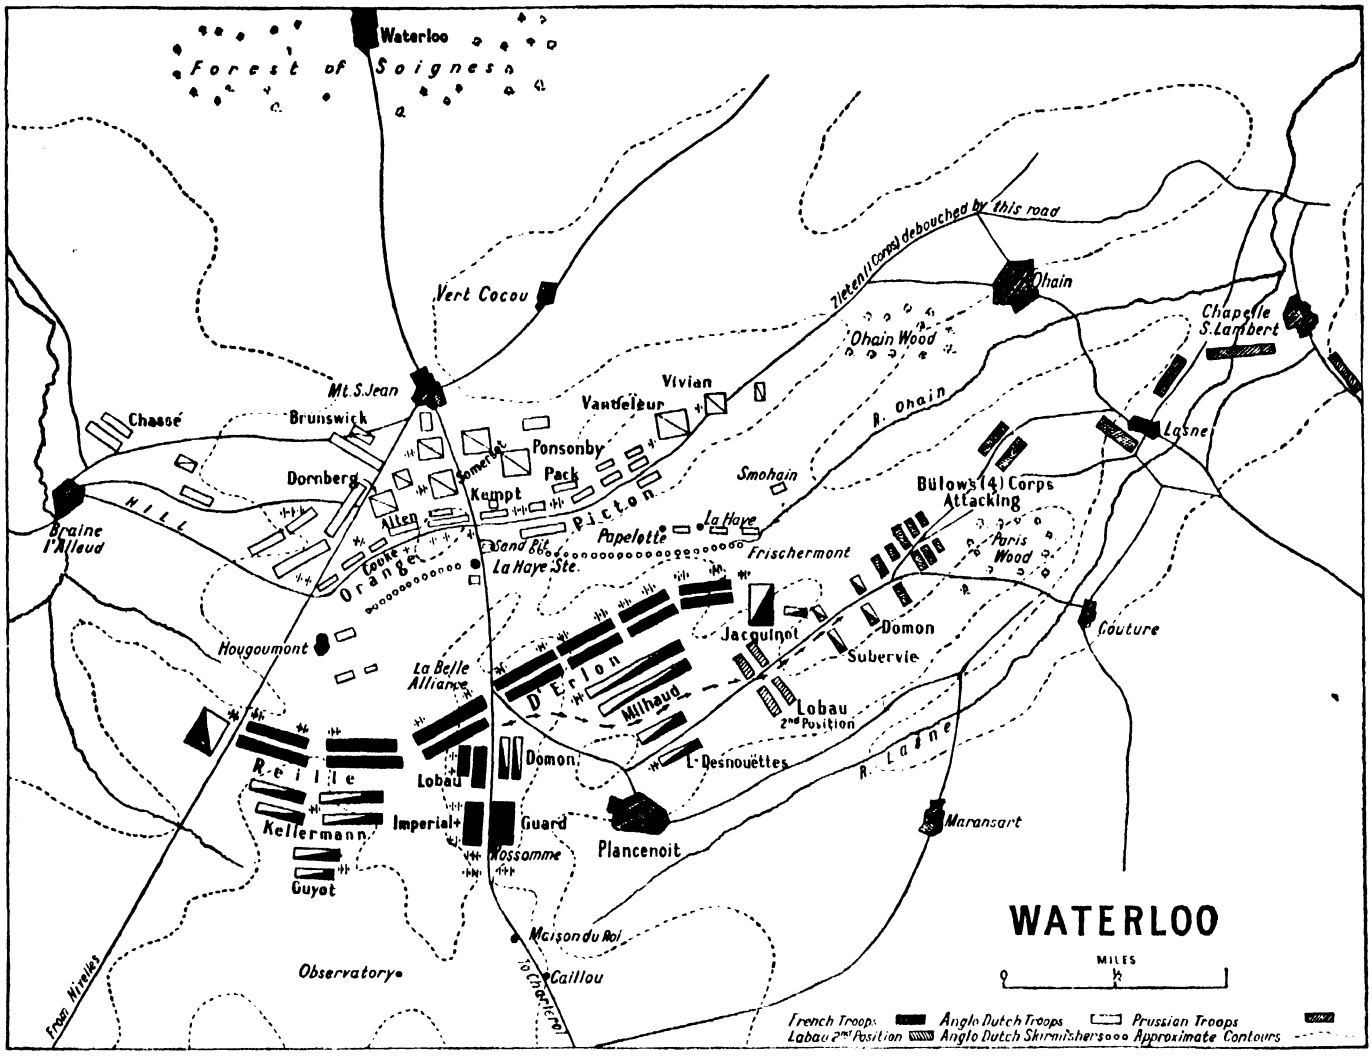
Meanwhile Grouchy and Vandamme wasted two hours deliberating in front of the Prussian brigade at Gilly. Then at 5:30 P.M. Napoleon again reached the front and vigour replaced indecision. After a brief cannonade Vandamme advanced with the bayonet and the Prussians gave way. Grouchy then moved on Fleurus and halted for the night.

Owing to Zieten's skill Blücher had secured his concentration area, one corps was in position, and two others were at hand. Thanks to his subordinates Wellington still retained a grip on Quatre Bras. His corps were assembling: I., Nivelles, Braine le Comte, Enghien; II., Ath, Grammont, Sotteghem; Cavalry, Ninove; Reserve, at Brussels. During the night the divisions were ordered to move to Nivelles, and at dawn the Reserve marched for Mt. St. Jean.

The duke had relied on information that did not come to hand. His intelligence officer, Colonel Colquhoun Grant, who was in France, was ordered to send back his reports to the duke through General Dörnberg at Mons. On June 15 Grant reported that the French Army was advancing, but Dörnberg refused to believe the report and returned it. Owing to this officer's presumptuous folly Grant's report only reached Wellington on June 18.

On the night of the 15th the "Armée du Nord" was disposed as follows:—Left Wing, Frasnes to Marchienne; Right Wing, in front of Fleurus and astride the Sambre at Châtelet; Centre (or Reserve), Guard, between Gilly and Charleroi; but Milhaud's Cuirassiers and Lobau's (VI.) Corps were still south of the Sambre. Thus, despite the delays, Napoleon had secured a dominant strategical position. The allies were still encouraged to attempt a risky forward concentration, whilst Napoleon's covering forces were sufficiently far forward to be able to grip whichever ally adventured his army first. The "Armée du Nord" lay concentrated "in a square whose sides measured 12 m. each; and it could with equal facility swing against the Prussians or the Anglo-Dutch, and was already placed between them."

16th June.—Early in the morning Prince Bernard was reinforced at Quatre Bras by the rest of his division (Perponcher's); and Wellington's other troops were now all on the march eastward except the reserve, who were heading southwards and halted at the cross-roads of Mt. S. Jean until the duke had resolved that their objective should be Quatre Bras. They then marched in that direction. Blücher meanwhile was making his arrangements to hold a position to the south of the Namur-Nivelles road and thus maintain uninterrupted communication with Wellington at Quatre Bras.



Napoleon spent the early morning in closing up his army, and writing what proved to be the most important letter of the campaign to Ney (Charleroi, about 8 A.M.): "I have adopted as the general principle for this campaign to divide my army into two wings and a reserve. . . . The Guard will form the reserve, and I shall bring it into action on either wing just as circumstances dictate. . . . According to circumstances I shall weaken one wing to strengthen my reserve. . . ." Here, in its simplest form, is the principle that underlies Napoleon's strategy in 1815. Only on the wing on which the reserve is brought into action will a decisive result be aimed at. The other is to be used exclusively to neutralize the other enemy, by holding him at bay.

Napoleon's plan for this day assumed that the surprised allies would not risk a forward concentration. The emperor intended to push an advanced guard to Gembloux to ward off Blücher, and move up the Guard to Fleurus. But once in possession of Sombreffe, the emperor would swing the reserve westward to join Ney, who should then have mastered Quatre Bras and have pushed out a force to link with Grouchy, as well as another body 6 m. to the northward. The centre and left wing would then march by night to Brussels. The allies would thus be irremediably sundered. Meanwhile Napoleon and the VI. Corps waited at Charleroi for further information. Up till noon Ney took no serious step to capture Quatre Bras, which still lay at his mercy. Grouchy reported that Prussian masses were coming up from Namur, but Napoleon ignored this. Before 10 A.M. Ney reported considerable hostile forces at Quatre Bras. The marshal was ordered to crush what was in front of him and report to Fleurus. Here Napoleon arrived at 11 A.M., still leaving Lobau at Charleroi. Napoleon at once reconnoitred the situation. Only one Prussian corps was showing, but it was disposed parallel to the Namur road, as if to cover a forward concentration. Had the decisive day arrived? If so, by 2 P.M. Vandamme, Gérard, Pajol and Exelmans would be available for the assault, and the Guard and Milhaud would act as a reserve. At 2 P.M. Napoleon ordered Ney to secure Quatre Bras, as the emperor was attacking the Prussian corps. Whichever wing succeeded first would then wheel inwards and help the other. The decisive flank had not yet become clear.

Blücher had determined to fight. Wellington, on arrival at Quatre Bras, finding all was quiet rode over to meet Blücher at Brye. Considering no serious force was in front of Quatre Bras, Wellington ended the interview with the conditional promise that he would bring his army to Blücher's assistance at Ligny, if he was not attacked himself. But on his return to Quatre Bras he found the situation already critical.

Quatre Bras.—Ney had let slip the chance when he could have mastered Quatre Bras with ease, and thereby ensured co-operation with Napoleon. He waited to mass Reille's Corps before he advanced, though the Prince of Orange had only 7,500 troops at Quatre Bras. The Prince had boldly scattered his force, made wise use of cover and showed a firm front to Ney. It was 2 P.M. when the French attacked. East of the road the Dutch-Belgians were forced back and the line wavered. But at 3 P.M. Merlen's cavalry rode in from Nivelles, Picton and the 5th division marched up from Brussels, and Wellington himself returned. Picton stopped the French advance, but Reille's last division was thrown in on the French left, and a hot fight broke out. The Brunswick contingent now reached Wellington and at once attacked. It was 4:15 P.M. Ney had just received Napoleon's 2 P.M. order, and he promptly pressed his attack and almost cleared the Bossa wood. However, at 5 P.M. Alten's division arrived from Nivelles, and Ney realized that he needed D'Erlon's corps to gain the cross-roads.

About 5:15 P.M. Ney learned that D'Erlon, without his knowledge, had moved eastwards to co-operate at Ligny. Then at 5:30 P.M. he received Napoleon's order to seize Quatre Bras and swing in against Blücher who was pinned at Ligny. Napoleon added, "the fate of France is in your hands." Ney's duty was clear. He must hold Wellington at Quatre Bras and allow D'Erlon to ensure that a decisive success was gained that day at Ligny. In no case could D'Erlon return in time to be of any use at Quatre Bras. Ney, beside himself with rage, sent imperative orders to D'Erlon to return and ordered Kellermann's cuirassier brigade to break through Wellington's line. The charge was admirably executed. A British regiment, caught in line, was overthrown and lost a colour. But unsupported, the horsemen were then beaten back. At that moment Ney received a verbal message from Napoleon ordering him, whatever happened at Quatre Bras, to allow D'Erlon to carry out the move to Ligny. Despite remonstrance, Ney refused to reconsider D'Erlon's recall and plunged into the fight. Then about 7 P.M. the British Guards reached Wellington and at last gave him the numerical superiority. Promptly the duke attacked all along the line, and by nightfall the French had been driven back to Frasnes. The losses were, Anglo-Dutch 4,700, French 4,300. At 9 P.M., when the battle was over, D'Erlon arrived. The corps had reached the edge of the Ligny battlefield when it received the counter-order. Thinking he was still under

Ney, D'Erlon decided to leave one division at Wagnelée and to return to the left wing. The incident was immeasurably unfortunate for the French. Had D'Erlon been used betimes at Quatre Bras, Wellington would have been crushed; had he only engaged at Ligny, D'Erlon would have ensured Blücher's annihilation. But oscillating between the two fields the Corps took part in neither. At 10 P.M. Ney wrote a short and somewhat one-sided report to Soult.

Ligny.—On the other flank there had meanwhile been waged the very bitterly fought battle of Ligny. As Blücher's dispositions gradually became clearer the emperor realized that the first decisive day of the campaign had actually come and promptly made arrangements for defeating the Prussian army in his front. Blücher, to cover the Namur road, held with the I. Corps the villages of Brye, St. Amand, and Ligny, whilst behind his centre was massed the II. Corps, and on his left was placed the III. Corps. Wellington and Bülow on arrival would act as general reserve. Blücher's army was quite visible to Napoleon on the bare open slopes, the II. Corps being especially exposed. The emperor decided to bear down Blücher's centre and right with the corps of Vandamme and Gérard and with Girard's division which he had drawn into his operations, containing the Prussian left meanwhile with the squadrons of Pajol and Exelmans, assisted by a few infantry. The Guard and Milhaud were in hand at Fleurus. Further, he could order up Lobau, and direct Ney to move his rearward corps across and form it up behind Blücher's right. When the battle was ripe, he would crush the Prussian centre and right between the Guard and D'Erlon's corps. It was a somewhat complicated manoeuvre; for he was attempting to outflank his enemy with a corps that he had subordinated to Marshal Ney. Much depended on whether Ney would grasp the full purport of his orders. The usual Napoleonic simplicity was wanting at Ligny, and he paid in full for the want.

The Prussians numbered about 83,000 to Napoleon's 71,000 (including Lobau). About 2:30 P.M. the sound of Ney's guns to the westward proved that Wellington was attacked and Napoleon then opened the battle. A fierce fight soon raged for the villages of Ligny and St. Amand. By 3:15 P.M. the battle was in full swing and Napoleon wrote to Ney, saying, "The fate of France is in your hands," and ordering the marshal to master Quatre Bras and move eastwards to assist at Ligny. Directly afterwards, hearing that Ney had 20,000 men in front of him, he sent the "pencil-note" by General La Bédoyère, directing Ney to detach D'Erlon's corps to Ligny. This the A.D.C., in a fit of mistaken zeal, took upon himself to do. Hence the corps appeared too soon and in the wrong direction. It is clear that Ney's essential duty was to co-operate at Ligny, provided that Wellington was held fast at Quatre Bras. Unfortunately, in the heat of action, Ney misread his instructions. Meanwhile the emperor had ordered Lobau to move up to Fleurus. The fight for the villages raged fiercely and incessantly, and the places were captured and recaptured. Generally the French had the better of the fighting, and Blücher was compelled to use up more and more of his reserves. The fighting grew so furious that the troops literally melted away. Even the emperor had to call on his reserves. Just as the Young and Middle Guard moved to reinforce Gérard and Vandamme, the latter reported that a hostile column, 30,000 strong, was threatening his left (in reality it was D'Erlon). This sight unnerved Vandamme's exhausted troops, and guns had to be turned on them to quell a panic. It was nearing 6 P.M. Napoleon concluded that this could not be D'Erlon, as he had arrived too soon and was marching in the wrong direction.

Napoleon sent an officer to reconnoitre. As the French attacks slackened the Prussians rallied and counter-attacked, but they were beaten back by the Young Guard. By 6:30 P.M. Napoleon learned that the force was D'Erlon's, and that it had withdrawn westwards. Thus there was no direct co-operation from the Left Wing on this decisive day. The emperor had perforce to finish the battle single-handed.

Blücher now launched a general counter-stroke against Vandamme, but the chasseurs of the Guard drove back the Prussians in disorder and Napoleon's chance had come at last. As Lobau formed up near Fleurus, the guns of the Guard opened on Ligny to prepare Blücher's centre for assault. At 7:45 P.M. a crashing salvo from 60 guns heralded a combined onslaught by Gérard, the Guard, and Milhaud. This tremendous impact of picked troops pierced and broke the Prussian centre. Blücher promptly launched his cavalry reserve to stem the French advance. Leading a charge in person he was dismounted and ridden over, before he was rescued and borne from the field. Blücher had taken an unjustifiable personal risk, for at this crisis it was essential for the Prussians to be commanded by a chief who would keep loyally in touch and act in concert with his colleague. By 9 P.M. the battle was over and the French pressed resistlessly onwards. The beaten Prussians retired to the north of the Namur road. But in the failing light and in the uncertainty as to events on the left wing, immediate pursuit was out of the question.

The execution had again fallen short of the conception; Blücher though beaten was not destroyed, nor was his line with Wellington cut. If the Prussians now retired northwards, parallel to the direction which Wellington would follow perforce on the morrow, the chance of co-operating in a decisive battle would still remain to the allies; and Gneisenau's order issued by moonlight, directing the retreat on Tilly and Wavre, went far to ensuring the possibility of such combined action. However, Gneisenau was very remiss in not immediately reporting this vital move and the necessity for it to the duke, as it left the Anglo-Dutch inner flank quite exposed. Gneisenau apparently selected Wavre, not with the intention of assisting his ally, but rather to re-establish his own line of communication, and the presence of the Prussians on the field of battle of Waterloo must be put down to the immortal credit of Blücher and Grolmann, his quartermaster-general.

Gneisenau allowed the re-establishment of his communications to overweigh the paramount necessity of arranging concerted action with his ally. Probably Wellington's failure to co-operate at Ligny had heightened the Prussian chief-of-staff's unworthy suspicions of the duke's good faith. It was well for the allies that Blücher was able to resume command before Napoleon had time to profit from the dissensions that would probably have arisen had Gneisenau remained in control. The casualties at Ligny were very heavy. The Prussians lost 12,000 men and 21 guns, and the French 8,500 men. So close was the fighting that most of the 20,000 casualties lay on 2 sq. m. of ground.

Napoleon's plan of campaign had succeeded. Despite D'Erlon's misadventure, Ney's failure had placed the Anglo-Dutch army in a precarious position. Napoleon having beaten Blücher, the latter must fall back to rally and re-form. On the other flank Ney lay in front of Wellington, and the marshal could fasten upon the Anglo-Dutch army and hold it fast on June 17, sufficiently long to allow the emperor to close round its open left flank and deal it a death-blow. It was essential to deal with Wellington before Blücher could re-appear on the scene. Wellington was but imperfectly informed of the details of the result of Ligny. Certainly Blücher had despatched an aide-de-camp to warn Wellington that he was forced to retire. But the officer was shot and the message remained undelivered. Nor did Gneisenau repeat this important message directly he assumed temporary command. Gneisenau's neglect involved the allies in an unnecessary and very grave risk.

June 17.—Napoleon was unwell, and was not in the saddle as early as he would otherwise have been; and neither Soult nor Ney made any serious arrangements for an advance when every minute was golden. By early morning the duke had most of his army about Quatre Bras. But Blücher's defeat had rendered Wellington's position untenable. Still ignorant of Blücher's exact position, Wellington sent out a well-escorted officer to establish touch with the Prussians. He reported that the Prussians were drawing off to rally at Wavre. Then, about 9 A.M., a Prussian officer arrived to explain the situation and learn Wellington's plans. The duke replied that he should fall back and accept battle near Mt. S. Jean, provided he was assured of the support of one of Blücher's corps. He now subordinated everything to remaining in communication with Blücher. It was 2 A.M., June 18, before Wellington received an answer.

Covered by Thielemann the Prussians had drawn off towards Gembloux to join Bülow. Meanwhile, soon after dawn, the French cavalry rounded up some stragglers on the Namur road, and for a time confirmed the idea that Blücher was retiring on his base. The situation was still obscure, details about what had happened to Ney were wanting, and the direction of the Prussian retreat was uncertain. At 8 A.M. Ney was ordered to take up his position at Quatre Bras, or if he reported that it was impossible the emperor would co-operate. Napoleon meant that if only a rear-guard opposed Ney it was to be driven off and Quatre Bras occupied. But if Wellington was still there, the marshal was to hold him fast, and Napoleon would hasten up with the reserve and crush his enemy. Wellington in fact was there; but Ney did nothing to retain him, and at 10 A.M. the duke began to retire northwards. The last chance of bringing about a decisive French success was thus allowed to slip away.

Grouchy's Operations.—About 11 A.M. Napoleon came to a decision. He determined to send two cavalry corps, and Vandamme's and Gérard's corps, and Teste's division (33,000 and 110 guns) to follow the Prussians and discover if they intended uniting with Wellington in front of Brussels. As touch had been gained with Thielemann at Gembloux, Marshal Grouchy, who had been given command of the force, was ordered by the emperor to "proceed to Gembloux." This order the marshal obeyed literally. After an inconceivably slow march, in one badly arranged column moving on one road, Grouchy only reached Gembloux on June 17, and halted there for the night. Grouchy's cavalry who had been in touch with Thielemann's corps, at Gembloux, allowed it to slip away, and contact was lost for want of a serious effort to keep it. Grouchy did not proceed to the front and entirely failed to appreciate the situation. Pressing danger could only exist if Blücher had gone northwards, and northwards in the Dyle valley Grouchy should have sought for the Prussians. But on June 17 the marshal pushed no reconnaissances to the northward and westward of Gentinnes. (Actually Milhaud, when marching with Napoleon towards Quatre Bras, did see some Prussian infantry retiring northwards and reported this about 9 P.M. to Napoleon, but he attached little importance to it.) Had Blücher gone eastwards, then no danger threatened, for Grouchy could easily have held back any future Prussian advance on the line of the Dyle. Grouchy merely obeyed his orders literally and went to Gembloux. At nightfall the situation was in favour of the allies. The four Prussian corps were concentrated astride the Dyle at Wavre and Grouchy was actually outside them. After an unmolested retreat the Prussians were ready to take the field once more, and 24 hours before Napoleon had deemed it possible after their defeat at Ligny.

Napoleon's Pursuit of Wellington.—On the other flank, too, things had gone all in favour of Wellington. At noon Napoleon wrote to Ney that troops had been placed at Marbais to second the marshal's attack on Quatre Bras, yet Ney remained quiescent, and Wellington began his retreat unmolested. Thus on Napoleon's arrival only the duke's cavalry screen and some horse artillery remained on the position. As the emperor justly said, Ney had ruined France. This was the fatal mistake of the campaign. Although Napoleon opened a rapid pursuit as the cavalry screen crumpled up and decamped, yet he failed to entangle the rear guard so deeply as to force the duke to return to its assistance. Also a tropical thunderstorm considerably retarded the French pursuit. Only as the light failed did Napoleon arrive opposite to Wellington's position, and then by a masterly reconnaissance in force he compelled the duke to disclose the presence of virtually

the whole army. The French halted between Rossomme and Genappe, bivouacking in the sodden fields.

June 18.—During the night Wellington heard that Blücher would bring two corps certainly, and possibly four, to Waterloo, and the duke determined to accept battle. Yet so far was Wellington from divining Napoleon's plan that he stationed 17,000 men (including Colville's British division) about Hal, 8 m. to his right, to repel a turning movement that he groundlessly anticipated and to form a rallying point for his right in case his centre was broken. By making this detachment the duke ran a very grave risk. But with the 67,600 men and 156 guns which he had in hand, he took up a truly admirable "Wellingtonian position" in front of Mt. S. Jean. He used a low ridge to screen his main position, exposing comparatively few troops in front of the crest. He occupied Hougoumont with detachments of the British Guards and placed a King's German Legion garrison in La Haye Sainte, the key of his position. The duke also took care to distribute the troops so that the indifferent and immature were closely supported by those who were "better disciplined and more accustomed to war." Full arrangements for Blücher's co-operation were made through General Müffling, the Prussian attaché on the duke's staff. The duke was to stand fast and receive the attack, whilst Blücher closed round Napoleon's exposed right. Thus the Prussians were the real general reserve on this day.

Blücher kept his promise loyally, but the execution was faulty. The Prussians did not start marching at dawn, and the rear corps (Bülow) was selected to lead the column. A fire that broke out in Wavre further delayed the march. But, despite his hurts, the old marshal was in the saddle.

Luckily the wet state of the ground (largely cornfields) and the scattered bivouacs of the French caused Napoleon's attack to be put off until 11.30 A.M. Grouchy had reported at 10 P.M., 17th, from Gembloux that the Prussians were retiring towards Wavre and Perwez. He stated that he meant to follow the Wavre column, if it was the stronger, and separate it from Wellington. But this was impossible. Grouchy was outside the Prussian left and, by following it, he must inevitably drive the allies together. The emperor answered the letter at 10 A.M., and directed the marshal to march for Wavre. Napoleon's original plan must be kept in mind when considering this letter. It will then be seen to mean that Grouchy was to place his force on Blücher's inner flank and hold him back from Waterloo. But this is just what the letter does not state precisely; accordingly Grouchy (as Ney had done previously) misread it.

Meanwhile the French army formed up some 1,300 yards from Wellington's position. Although some misgivings filled the minds of such Peninsular veterans as Soult, Reille, and Foy, none assailed Napoleon. But the late hour at which the battle opened, and Napoleon's determination to break Wellington's centre instead of outflanking his left and farther separating the allies, deprived him of any chance of beating Wellington before Blücher could intervene. Napoleon drew up his army of 74,000 and 246 guns in three lines in full view of the Anglo-Dutch army. It was an imposing array of veteran troops backed by the dark masses of the Imperial Guard. As their emperor rode along the lines the troops acclaimed him with extraordinary enthusiasm.

WATERLOO

First Phase.—About 11.30 A.M. the battle was opened with an attack by one of Reille's divisions on Hougoumont. This was merely to draw Wellington's attention to his right, and in this it failed. Half-an-hour later a battery of 80 guns unlimbered on the long spur to the S.E. of La Haye Sainte to prepare the duke's centre for the main attack. But the crest of the "Wellingtonian position" sheltered the defence from the tempest of iron. After 1 P.M., and just before he gave orders for Ney to lead the main attack, the emperor scanned the battlefield, and on his right front he saw a dense dark cloud emerging from the woods at Chapelle Saint Lambert. It was soon discovered that this was Bülow's corps marching to Wellington's assistance. A letter was now awaiting despatch to Grouchy, and to it was added a postscript that the battle was raging with Wellington, that Bülow's corps had been sighted by the emperor, and that the marshal was to hasten to the field and crush Bülow. This order at least was clear, but it was sent 12 hours too late, and when Grouchy received it he was unable to carry it out. To neutralize Bülow when necessity arose, the emperor now detached Lobau together with the squadrons of Domon and Subervie. The general, however, hardly drew out far enough from the French right; otherwise the magnificent resolution he displayed and the admirable obstinacy with which his troops fought against ever-increasing odds are worthy of all praise. Thus as early as 1.30 P.M. the Prussian intervention deranged the symmetry of Napoleon's battle-array. The emperor never considered breaking off the fight and seeking a more favourable opportunity of beating the allies in detail. He was still determined to involve both Wellington and Bülow in a common ruin.

Second Phase.—Ney was therefore ordered to attack Wellington's centre with D'Erlon's corps. Owing to a misconception the columns used for advance were over-heavy and unwieldy, and the corps failed to achieve anything of importance. As D'Erlon's troops advanced the Dutch-Belgian brigade in front of the ridge, which had been subjected to an overwhelming fire from the 80 French guns at close range, turned about and retired in disorder through the main position. This, however, was the solitary success secured by the I. corps; for the left division failed to storm La Haye Sainte and Picton's division met the remainder of D'Erlon's corps face to face, engaging them in a murderous infantry duel in which Picton fell. During this struggle Lord Uxbridge launched two of his cavalry brigades on the enemy; and the "Union brigade" catching the French infantry unawares rode over them, broke them up, and drove them to the bottom of the slope with the loss of two eagles; but the British cavalry were driven back with great loss by fresh French horsemen hurled on them by the emperor. So far no success against Wellington had been achieved, and Bülow was still an onlooker.

Third Phase.—Ney was now ordered to attack La Haye Sainte again, but the attack failed. A furious cannonade raged, and the Anglo-Dutch line withdrew slightly to gain more cover from the ridge. Ney misinterpreted this manoeuvre and led out, about 4 P.M., Milhaud's and Lefebvre-Desnouëttes' horsemen (43 squadrons) to charge the allied centre between the two farms. For several reasons, the cavalry could only advance at a trot. As the horsemen closed they were received with volleys of case from the guns, and the infantry formed into squares. Against the squares the horsemen were powerless, and failing to break a single square, they were finally swept off the plateau by fresh allied horsemen. Kellermann's cuirassiers and the heavy horse of the Guard (37 fresh squadrons) now advanced to support the baffled cavalry, the latter falling in as supports. The whole 80 squadrons resumed the attack, but with no better result. The cavalry gradually became hopelessly entangled among the squares they were unable to break, and at last they were driven down the face of the ridge and the most dramatic part of the battle came to an end. Had these great cavalry attacks been closely supported by infantry, there can be little doubt that they must have achieved their object. But they were not. In his handling of the three arms together, Napoleon on this day failed to do justice to his reputation.

About 4.30 P.M. Bülow at last engaged. Lobau's men were gradually overpowered and forced back into Plancenoit, the village was stormed, and the Prussian round shot reached the main road. To set his right flank free the emperor called further on his reserve, and sent Duhesme with the Young Guard to Lobau's support. Together, these troops drove Bülow out of Plancenoit, and forced him back towards the Paris wood. But the Prussians had not yet changed the fate of the day.

Fourth Phase.—Napoleon now ordered Ney to carry La Haye Sainte at whatever cost, and this the marshal accomplished with the wrecks of D'Erlon's corps soon after 6 P.M. The garrison (King's German Legion) had run out of rifle ammunition and the French bursting in seized the post. This was the first decided advantage that Napoleon had gained during the day. The key of the duke's position was now in Napoleon's hands, Wellington's

centre was dangerously shaken, the troops were exhausted, and the reserves inadequate. But the Iron Duke faced the situation unmoved. Calmly he readjusted his line and strengthened the torn centre. Happily for him, Pirch I. and Zieten's corps were now at hand. Pirch I. moved to support Bülow; together they regained possession of Plancenoit, and once more the Charleroi road was swept by Prussian round shot. Napoleon, therefore, had to free his right flank before he could make use of Ney's capture. To this end he sent two battalions of the Old Guard to storm Plancenoit. The veterans did the work magnificently with the bayonet, ousted the Prussians from the place, and drove them back 600 yards beyond it. But Napoleon could not turn now on Wellington. Zieten was fast coming up on the duke's left, and the crisis was past. Zieten's advent permitted the two fresh cavalry brigades of Vivian and Vandeleur on the duke's extreme left to be moved and posted behind the depleted centre. The value of this reinforcement at this particular moment can hardly be overestimated.

Fifth Phase.—The French now fiercely attacked Wellington all along the line; and the culminating point of this was reached when Napoleon sent forward the Guard, less 5 battalions, to attack Wellington's centre. Delivered in three échelons, these final attacks were repulsed, the first échelon by Colin Halkett's British Brigade, a Dutch-Belgian battery, and a brigade of Chassé's Dutch-Belgian division; the second and third échelons by the Guards, the 52nd, and the Royal Artillery. Thus ended the fifth phase.

Rout of the French.—As the Guard recoiled (about 8 P.M.) Zieten pierced the north-east corner of the French front, and their whole line gave way as the allies rushed forward on their now defenceless prey. Three battalions of the Guard indeed stood their ground for some time, but they were finally overwhelmed. Afterwards, amidst the ruins of their army, two battalions of the 1st Grenadiers of the Guard defied all efforts to break them. But, with the exception of these two battalions, the French army was quickly transformed into a flying rabble. Bülow and Pirch I. now finally overpowered Lobau, once more recaptured Plancenoit, and sealed the doom of the French army. But Lobau's heroic efforts had not been in vain; they had given his master time to make his last effort against Wellington; and when the Guard was beaten back the French troops holding Plancenoit kept free the Charleroi road, and prevented the Prussians from seizing Napoleon's line of retreat.

When Wellington and Blücher met about 9.15 P.M. at "La Belle Alliance," the victorious chiefs arranged that the Prussians should take up the pursuit, and they faithfully carried out the agreement. Pushing on through the night, they drove the French out of seven successive bivouacs and at length drove them over the Sambre. The campaign was virtually at an end, and the price paid was great. The French had lost over 40,000 men and almost all their artillery on June 18; the Prussians lost 7,000, and Wellington over 15,000 men. So desperate was the fighting that some 45,000 killed and wounded lay on an area of roughly 3 sq.m. At one point on the plateau "the 27th (Inniskillings) were lying literally dead in square"; and the position that the British infantry held was plainly marked by the red line of dead and wounded they left behind them.

Grouchy's Operations June 18–19.—A few words may now be bestowed on Marshal Grouchy, commanding the right wing. The marshal wrongly determined on the 18th to continue his march to Wavre in a single column, and he determined, still more wrongly, to move by the right bank of the Dyle. Breaking up from bivouac long after dawn, he marched forward, via Walhain. Here he stopped to report to the emperor some intelligence which turned out to be false, and he remained for breakfast. Hardly had he finished when the opening roar of the cannonade at Waterloo was heard. Grouchy was now urged by his generals, especially by Gérard, to march to the sound of the firing, but he refused to take their advice, and pushed on to Wavre, where he found the Prussians (Thielemann's corps of 16,000 men) holding the passages across the Dyle. A fierce fight (called the Action of Wavre) began about 4 P.M., in which the Prussians were for long victorious. Instead of concentrating his force upon one bridge over the swampy and unfordable Dyle, Grouchy scattered it in attacks upon several; and when the emperor's despatch arrived, saying Bülow was in sight, the marshal was powerless to move westward. Towards the end of the day Colonel Vallin's Hussars stormed the Limale bridge, and a large part of Grouchy's force then promptly gained the left bank. The action continued till about 11 P.M., when it died out, to recommence shortly after dawn. Thielemann was at length overborne by sheer weight of numbers, and towards 11 A.M. he was forced to retire towards Louvain. The losses were considerable, about 2,400 men on each side.

Grouchy's victory was barren. In the far higher duty of co-operation he had failed miserably. His tactical achievement could avail the emperor nothing, and it exposed his own force to considerable danger. Whilst pondering on the course he should follow, the marshal received the news of the awful disaster that had overtaken the emperor at Waterloo. In a flash he realized his danger and made prompt arrangements to begin his retreat on Namur, the only line to France that was then available. This retreat he carried out resolutely, skilfully and rapidly, slipping past Blücher and finally bringing his force to Paris. But the rapid advance of the allies gave France no time to rally. Napoleon was forced to abdicate, and finding escape was impossible, he surrendered (on July 14) to the British—"the most powerful, the most unwavering and the most generous of his foes."

The causes of Napoleon's failure in the Waterloo campaign were as follows:—The French army was numerically too weak for the gigantic task it undertook. Napoleon himself was no longer the Napoleon of Marengo or Austerlitz, and though he was not broken down, his physical strength was certainly impaired. Ney failed to grasp and hold Wellington on the critical 17th of June; and on the 17th and 18th Grouchy's feeble manoeuvres enabled Blücher to march and join Wellington at Waterloo. Napoleon's chance of success was dangerously diminished, if not utterly destroyed, by the incompetence of the two marshals whom in an evil hour he selected for high commands.

Another dominant influence in shaping the course of events was the loyalty of Blücher to his ally, and the consequent appearance of the Prussian army at Waterloo. Nor must we overlook Wellington's unswerving determination to co-operate with Blücher at all costs, and his firmness on June 18; or the invincible steadiness shown by the British troops and those of the King's German Legion.

Reviewing this campaign at St. Helena, Napoleon laid the responsibility for the disaster of Waterloo on the inaction of Marshal Grouchy who, after he had lost touch with the Prussian army (which had crossed the Dyle at Wawres in order to work round to the north in the direction of Soignes), ignored the urgent representations of his officers, and in particular of General Gérard, and refused to unite his forces with the bulk of Napoleon's army, although he could hear the sound of the guns. However grave may have been Grouchy's error, it would be unjust to characterize his failure as treason. In any case, Marshal Grouchy, in spite of the miscarriage of his first mission, fearing to depart from the orders of the emperor, showed himself deficient not only in military insight but also in character.

In this article the writer has been greatly assisted by the advice and suggestions of Lt.Col. H. W. L. Hime, R.A. (A. F. Be.)

WATERLOO-WITH-SEAFORTH, an urban district in the Bootle and Ormskirk parliamentary divisions of Lancashire, England, at the mouth of the Mersey, 4 m. N. by W. of Liverpool. On account of its facilities for bathing, firm sands, pleasant scenery and nearness to Liverpool, of which it is a suburb, it is much frequented both by visitors and by residents.

WATERLOW, SIR ERNEST ALBERT (1850–1919), English painter, was born in London, and received the main part of his art education in the Royal Academy schools, where, in 1873, he gained the Turner medal for landscape-painting. He was elected associate of the Royal Society of Painters in Water-Colours in 1880, member in 1894, and president in 1897; associate of the Royal Academy in 1890, and academician in 1903; and he was knighted in 1902. He began to exhibit in 1872 and has produced a considerable number of admirable landscapes, with and without figures, in oil and water-colour, handled with grace and distinction. One of his pictures, "Galway Gossips," is in the National Gallery of British Art. He died on Oct. 25, 1919.

See *Sir E. A. Waterlow, R.A., P.R.W.S.*, by C. Collins Baker (*Art Journal* Office, 1906).

WATERMARKS, the emblems or designs in paper used originally in Italy in the latter part of the 13th century. The Orientals, who were the first to make paper, did not employ watermarks, although their method of fabricating sheets of paper was almost identical with that introduced into Europe during the middle 12th century.

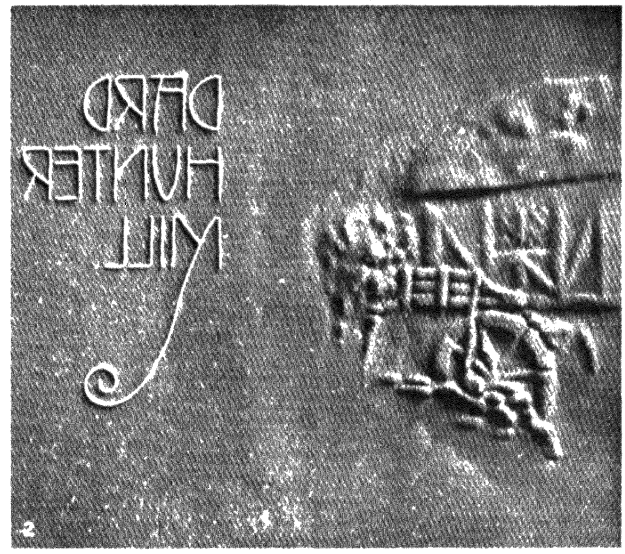
The original Italian watermarks consisted of devices such as crosses, circles, triangles and forms of the simplest kind that could be readily twisted in wire. Until the middle of the 19th century all watermarks were formed in outline and were produced by the use of metal wires bent to the shape of the required design. These wire objects were then sewed to the mould on which the paper was to be formed, the wire leaving its impression in the wet sheet of paper by causing the fibres to lie thinner along its course. The ordinary watermarks in hand-made paper of the present day are made in the same manner as those from the inception of the art, the only difference being in the employment of finer wire and greater skill in their formation. Plate I., fig. 3, shows the wire device on the covering of a laid paper mould from the 16th century; fig. 5 gives a section of an 18th century Dutch mould with the watermarking wires in place.

About the middle of the 19th century a more complicated and artistic form of watermarking was devised and instead of being limited to simple outline forms, it was possible to cause the paper to be made in any degree of thickness or tone desired. Fig. 1 shows a mould for the watermarking of a portrait. This mould has been made by first modelling the profile in a sheet of wax so that the various degrees of light and shade may be had and then making intaglio and cameo dies from the wax model by electrotyping. Closely-woven brass wire gauze is then subjected to great pressure between the two electrotype plates, the wire cloth or gauze taking the same contour as the original wax relief. In forming sheets of paper on a hand mould the water drains through the woven wire, leaving the moist pulp in precisely the same thicknesses as those sculptured in the wax original. The watermarking of paper in colour was invented by Sir William Congreve in 1818 (English patent, Dec. 4, 1819, No. 4419) and consisted in placing coloured paper stock (pulp) in various layers to form a homogeneous sheet of paper.

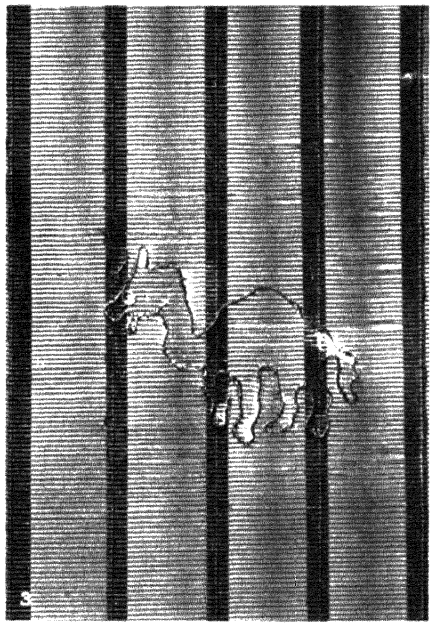
The foregoing treats only of watermarks that are produced in hand-made paper where the moist pulp lies on the wire lettering or pressed wire design during the whole process of forming the sheet. This naturally gives a brilliant and clear-cut watermark. In machine-made paper a wire cylinder known as a "dandy-roll" or a circular rubber form is used to impart the lettering or symbol to the moist paper by rolling over its surface *after* the web of paper has been formed. It is therefore not possible to produce as clear or distinct a watermark on a machine as it is by the use of a finely-constructed mould in the hands of a skilled craftsman.

(D. Hu.)

WATERMELON (*Citrullus vulgaris*), an annual plant of the gourd family (Cucurbitaceae, *q.v.*), native to tropical and southern Africa and widely cultivated since ancient times for its refreshing fruit. It is depicted in Egyptian paintings dating to the time of the pyramids. The plant is a prostrate, long-running, hairy vine, with branched tendrils and large leaves, 4 in. to 7 in. long, somewhat oblong in outline and deeply cut into several narrow lobes, the leaf-stalks much shorter than the leaves. The flowers, borne singly in the axils of the leaves, are light yellow, about 1½ in. broad, and divided into five lobes. The fruit is a large berry-like structure (pepo), spherical or oblong in form, mostly smooth and uniform green or mottled with lighter portions, with a hard but not durable rind, and red flesh containing numerous smooth, flat, black or white seeds. Under cultivation the fruit attains very large size, often 1½ ft. to 2 ft. or more long and weighing from 20 lb. to 50 lb. or more, filled nearly to the rind with red (sometimes yellowish or white) pleasantly flavoured pulp, with abundant, sweet, watery juice. The watermelon is grown in most warm temperate countries, especially China, India, southern Russia, southern France, Egypt, South Africa and the southern United States. A harder, white-fleshed form, known as preserving melon or citron, is used for making conserves. In 1926 the commercial crop of the United States was grown on 199,060 acres, with a total production of 69,698 carloads (of 1,000 melons each), valued at $10,642,920, 70% of which were grown in Georgia, Florida, Texas and California.

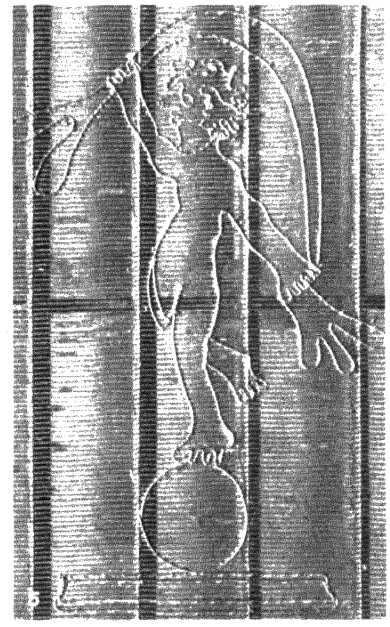


WATER MOTORS: *see* Hydraulic Motors; Turbine, Water.



WATER-OPOSSUM or **YAPOCK** (*Chironectes minimus*), distinguished from other opossums by its aquatic habits, webbed hind-feet, and peculiar coloration. Its ground colour is light grey, with four or five sharply contrasted brown bands passing across its head and back giving it a very peculiar mottled appearance; the head and body together are about 14in. long, and the tail a little more. It feeds on small fish, crustaceans and other water animals; its range extends from Guatemala to southern Brazil.

WATER POLO, a game which has done much to advance swimming in popular favour and to improve the stamina of swimmers. It is played either in a bath or open water, the teams consisting of seven on a side. The field of play must not exceed 30yd. or be less than 19yd. in length and the width must not be more than 20yd. The ball used must be round and fully inflated and must not measure less than 26½, nor more than 28in. in circumference. It must be waterproof, with no strapped seams outside and no grease or other objectionable substance placed on it. The goals must be 10ft. in width, with a cross-bar 3ft. above the surface when the water is 5ft. or over in depth, and 8ft. from the bottom when the water is less than 5ft. in depth; in no case must the water in which a game is played be less than 3ft. Goal nets are used in all important matches. The duration of a match is supposed to be 14 minutes, seven minutes each way. The officials consist of a referee, a timekeeper and two goal scorers, the first-named official starting the game by throwing the ball into the centre of the bath. The counting point of the game, called a goal, is scored by the entire ball passing between the goal-posts and under the cross-bar.



The players have to place themselves in a line with their respective goals, and are not allowed to start swimming to the centre of the bath until the word "Go" is given. They are usually divided into 3 forwards, 1 half-back, 2 backs and a goalkeeper. To the fastest swimmer is usually assigned the place of centre-forward and it is his duty to make all headway possible so as to reach the ball before the opposing forward of the other side, then pass rapidly back to the half or one of the backs and swim on to within close proximity of the opponent's goal and wait for a pass. The other forwards should rapidly follow him up and each man carefully shadow one of the opposing side. In handling the ball only one hand may be used, for to touch the ball with both hands at the same time constitutes a foul, as also does the holding of the rail or the side, during any part of the game, the standing on or touching of the bottom of the bath except for the purpose of resting; interfering or impeding an opponent in any way, unless he be holding the ball; holding the ball under water when tackled,

WATERMARKS AND WATERMARKING DEVICES

1. A complete mould (with deckle) for the watermarking of a portrait. The profile is first worked in wax so that various degrees of light and shade may be gained, and then intaglio and cameo dies are made from wax model by electrotyping
2. Hand made paper mould, combining lettering, and light and shade device for forming sheets of paper in one colour. Wires of lettering and pressed woven wire of design cause wet paper pulp to lie in many thicknesses, thus forming watermark in the sheet of paper
3. Wire device for watermarking figure of a camel in sheets of paper. Old papermakers favoured animals for watermarks
4. Mould for making hand-made paper, which combines the ordinary wire lettering and designs with the complicated light and shade device. With this mould the oval centre is produced in separate colour from balance of sheet. The wheel or star watermark (upper right-hand side) is that of John Tate who established the first paper mill in England in 1495. Watermarking device (upper left-hand side) is that of William Rittenhouse who founded the first paper mill in the Colonies in 1690
5. Wire device for a watermark showing a child swinging a rope

jumping from the bottom or pushing off from the side (except at starting or restarting) in order to play the ball or duck an opponent, holding, pulling back or pushing off from an opponent, turning on the back to kick at an opponent, assisting a player at the start or restart to get a good push off, throwing the ball at the goalkeeper from a free throw or refusing to play the ball at the command of the referee after a foul or when the ball has been out of the field of play. Dribbling or striking the ball is held to be not holding, but lifting, carrying, pressing under water or placing the hand under or over the ball when actually touching, is holding; dribbling up the bath and through the posts is permissible. There is a penalty area, 4yds. from each goal-post and the imaginary line across the bath is not allowed to be passed by the respective goalkeepers, otherwise they commit a foul. They may stand to defend their goal, touch the ball with both hands or jump from the bottom to play the ball, but in all other respects the same rules as to fouls apply to them as to other players. In any case they are not allowed to throw the ball beyond half-distance. If they do so the opposing side is awarded a free throw. For fouls which the referee considers to have been committed wilfully there are very severe penalties and those guilty of them are ordered out of the water until a goal has been scored, thus for the time being crippling the side. Deliberately wasting time, starting before the word "Go," taking up a position within 2yds. of the opponent's goal, changing position after the whistle has blown for a free throw or other similar stoppage of play, or deliberately splashing an opponent in the face, are all held to be wilful fouls. Whenever the whistle blows for fouls the players have to remain in their respective places until the ball has left the hand of the player to whom the free throw was awarded. A player who has been wilfully fouled within 4yd. of his opponent's goal line is given a penalty throw and the consequence is that a close match is often won by reason of a player deliberately breaking the rules when his goal is hotly assailed. In ordinary fouls the ball must touch another player before a goal can be scored, but in penalty throws it need not. Any player throwing the ball over his own goal line concedes a corner throw to the other side, but if an opposing player sends it over it is a free throw for the goalkeeper. After each goal is scored the players return to their respective ends, waiting for the word "Go," and at half-time they are allowed a rest of three minutes, during which they leave the water. Fouls, half-time and time are declared by whistle and goals by bell. The game requires practice of smart and scientific passing, side and back-handed throws and accurate shooting. For this purpose "throwing the water-polo ball" contests are commonly held by the leading clubs, who also conduct competitions on points for shooting at goal.

The game has become popular in many European countries, and friendly matches between English and continental clubs are frequently played. It has extended to all parts of the world since the British rules have been adopted for the Olympic games.

(W. He.)

See the Amateur Swimming Association's *Handbook* for rules of the game and instructions to referees.

United States.—The rules are similar to the British rules, excepting that the United States has added two umpires, besides having a referee and two goal judges.

WATERPROOF FABRICS: *see* Rainproof Fabrics.

WATER PURIFICATION. The partial purification of water probably dates back to the earliest times. No doubt, when a water looked very turbid, it was strained through any convenient material, or the suspended matters were allowed to settle out on standing. We know, too, that mariners found that dirty ill-tasting water collected at one port became often sweet and clean before the next port was reached. It is also not improbable that boiling water to purify it may have been an ancient precaution. Ages ago, everyone must have recognized the potent force of heat, and our ancestors possibly had their suspicions that dirty water caused disease and hence used heat as the most likely method of destroying impurities. Probably too, all sorts of things may have been added to water with the object, if not of purifying it, of at least rendering it more potable. Certainly as far back as 1612 the importance of keeping filthy matters out of drinking water was well-known, for in an indenture, relating to the New river, the following words occur:

"Wee doe by these presents for us our heirs and Successors straightly charge and Comaund all pson and psons whatsoever That they or anie of them doe not hereafter cast or putt into the said new river anie earth rubbish soyle gravell stones dogges Catts or anie Cattle Carrion or anie unwholesome or uncleane thing nor shall wash nor clense anie clothes wooll or other thinge in the said river . . ."

". . . nor shall make or convey anie sincke, ditch Tanhowse dying howse or seege into the said river or to have anie fall into the same."

As time went on sand came to be recognized as an effective filtering material, judged, no doubt, at first, by the clarified condition of the filtered product. Sand filtration, as a practicable proposition, dates back to 1829 and the honour seemingly belongs to London (Chelsea Water Co.). Later, the purification of water by sand filtration became an established procedure and the method has been copied all over the world and is still talked about as the London system of water purification. Quite apart from the bacterial "findings," it came to be recognized that an adequately filtered water was safe as regards disease. Then Koch showed why safety was secured, by proving that filtration removed 98 per cent of the bacteria. By this time bacteria had been assigned a definite rôle in the causation of disease.

The London rate of filtration is very slow, namely, about 2 gallons per sq. ft. per hour, or about 4 inches vertical drop in the same time. Approximately, it is represented by observing the progress of the end of the minute hand of a watch as it hourly completes its circular journey. Fine sand (about 3 ft. in depth) was nearly always used, supported on a graded gravel substratum.

Efficacy of Sand.—At first, sanitarians wondered why sand could be so effective when the separate particles were so gross in size compared with bacteria. It came, however, eventually to be recognized that the sand particles gradually matured so that each grain was surrounded with a furry yet slimy coating. In addition, the particles at, or near, the surface were observed to be enveloped and covered over with a heavy coating of slimy material which eventually became so dense as practically to stop the passage of water through it. When this occurred it became necessary to empty the filter, scrape off the surface layers of dirty sand and wash it very thoroughly before replacement. When a bed was re-started the results at first were apt to be unsatisfactory, and the usual custom was to run the filtrate to waste for several hours, or days. Even when the filtered water was allowed to pass into consumption, many authorities advocated a specially low rate of filtration being maintained for several days. This filtration has greatly reduced water-borne epidemic disease.

The increasing difficulty of securing supplies near at hand gradually led the great towns to invade the uplands and moorlands. Then new troubles arose, for although very pure and soft, such waters were often peaty and highly coloured and some of them were acid and acted upon lead. Experience showed that waters of this kind were best treated by filtering them through mechanical filters at the rapid rate of about 50 gallons per sq. ft. per hour, using a coagulant (sulphate of alumina, dose usually about 1–2 grains per gallon) to remove the colour and render the filtered water attractive in appearance. These mechanical filters are easily and expeditiously cleaned by a reversal of the flow of water.

Many authorities consider that mechanical filters are not so effective in removing bacteria as the slow sand filters, but when the source of supply is unexceptionable epidemiologically this is a matter of small importance. The point is that by the use of a coagulant they can achieve results, as regards clarification, practically impossible in the case of slow sand filters. As regards action on lead, this is a serious matter, as lead is a cumulative poison. Fortunately, it is possible by the use of lime, in suitable doses, to render such waters absolutely safe for domestic use.

Turning now to more modern methods of purification, the

chlorination of water at Lincoln during the typhoid epidemic (about 1,000 cases and 100 deaths) there in 1905 marked a forward step to which special attention must now be directed.

Chlorination.—In the United States and Canada chlorination, for some years past, has been the rule, not the exception. In England, progress has been much slower, but the World War greatly altered things, thanks to the initiative of men like Horrocks and Sims Woodhead. Further, the bold step taken by the Metropolitan Water Board in chlorinating so huge a volume of water as over 100,000,000 gal. a day proved a great incentive to further investigation of this water purification.

The "chlorinators" plead that inasmuch as they destroy practically all the non-sporing bacteria of intestinal origin they incidentally kill all the microbes, associated with epidemic water-borne disease. It is a bold claim, but apparently sound on the basis of current knowledge. The "anti-chlorinators" urge that a "doped" water is *prima facie* open to condemnation, and assert that there have been conspicuous failures in the chlorination processes in the past due to break-downs in the plant, or to dangerous compromises between doses sufficient to sterilize the water and yet small enough to avoid taste troubles. They further claim that natural processes (*e.g.*, storage and slow sand filtration) remove at least 98% of the total number of bacteria in the original water of whatever sort they may be, and that prolonged experience has shown that this is an absolute protection from the diseases associated with the ingestion of impure water.

A third school claims that all purification processes are merely a retrograde movement—that safety lies alone in choosing virgin, uncontaminated sources of water supply, requiring no sort of purification. It is possible to sympathize strongly with this exalted attitude of mind, but practically we must face, to an increasing extent, the necessity of rendering impure waters safe for domestic use. As regards the "chlorinators" and the "anti-chlorinators," there is much to be said on both sides, and each case should be judged on its own merits. Chlorination is an exceedingly cheap process; less than one shilling per 1,000,000 gal. of water treated may suffice. It is disputed how the chlorine acts. Some say it has merely an oxidation effect, others claim that it has an intrinsic bactericidal action. The dose is usually from 0·25 to 0·5 of available chlorine per 1,000,000 (2·5 to 5 lb. of chlorine per 1,000,000 gallons). The time required for sterilization varies according to the dose and the quality of the water. A few minutes may suffice, but one to five hours or more should be aimed at.

Administration.—The chlorine can be administered as a soluble hypochlorite (*e.g.*, alkaline sodium hypochlorite), or as a solution of bleaching powder (chloride of lime), or as a solution made from the gas liquefied in and liberated from metal cylinders. The latter process is now most extensively used, and there are some highly ingenious forms of apparatus for measuring accurately the gas as it flows from the cylinders through the chlorine apparatus on its way to the vessels or towers used for its final solution. Whatever method is adopted, it is highly important that the mixture of the chlorine and the water to be treated should be rapid and complete.

Successes.—The success of the treatment is determined by the destruction of *B. coli*, a non-sporing excremental microbe, slightly more hardy than the typhoid bacillus and the cholera vibrio. It is also gauged by the circumstance that there are places where the incidence of water-borne diseases has been modified to a most gratifying extent since, and apparently as a result of, the introduction of chlorination processes.

Taste Objections.—Taste troubles have been a most serious factor in the problem. Frequently, in consequence, the dose has been reduced below the limits of safe sterilization. Recently, however, knowledge has increased by leaps and bounds. It is now known that the presence of certain bodies (*e.g.*, phenoloid substances) in excessively minute amount (less than 1 in 1,000 millions) may be the root of the trouble. These impurities may arise from atmospheric contaminations, or be conveyed by liquid pollutions (*e.g.*, washings from roads, etc.). Fortunately, valuable remedies (taste preventers) have been found, *e.g.*, potassium permanganate and ammonia (dose about 0·2 per 1,000,000 the latter in terms of nitrogen). Even the organic matter, naturally present in waters, is a taste preventer, or "remover" of real value. There is no reliable indication that chlorinated water has any deleterious effect on man, the lower animals, fish-life or horticultural operations. On the whole, the same may be said as regards its alleged injurious effect on metals. Chlorination is a factor of great importance in water purification, although this admission may be coloured with certain cautious limitations. It can increase the margin of safety and can bring almost any water to any pitch of epidemiological perfection required. In the language of "the man in the street," chlorine, in doses of 0·25 to 0·5 per 1,000,000, can render dangerous waters safe without giving them (at all events in conjunction with taste removers) any unpleasant taste, or conferring on them any undesirable characteristics. Beyond all question, chlorination has come to stay, although it may be wise to regard it as a most valuable adjunct to other purification processes rather than as an absolute panacea.

Excess Lime Process.—In 1912 a new method of purification called the excess lime process was described. In softening waters lime is added in amount equal to, or just short of, what is necessary to combine with the dissolved carbonic acid in the water and with the bicarbonates. Carbonate of lime is formed, which, being practically insoluble, is thrown down as a precipitate. This mechanically purifies the water to a considerable extent, but does not produce a true bactericidal effect. In the excess lime method slightly more lime is added, so as to leave the water caustically alkaline, and this produces a marked bactericidal action. The amount of excess necessary depends on the duration of contact and the amount of impurities in the water, but one part of lime (as CaO) per 100,000 parts of water is usually sufficient.

The following quotation may serve to illustrate the usefulness of the excess lime method:—

> . . . the experiments carried out by us during the last two years at the Langford experimental station of the Southend Water Co., using water from two comparatively small rivers, show that by acting on Sir A. Houston's suggestion to use excess lime better results can be obtained than by the use of chlorine, since chlorine does not remove any of the organic matter in solution, whereas the excess lime will remove at least 50% of this. Waters, therefore, which a few years ago would have been considered quite unsuitable for a supply, and which no system of purification then known would have rendered safe, can now be utilized.

The method proved highly successful (1917) at Accra (Gold Coast Colony) in dealing with an impure swamp water used for water works purposes. Its successful use in 1913 enabled Aberdeen to decide on the retention of the River Dee as a source of water supply, thus saving over £100,000 on alternative schemes. In 1914 it was shown at Sunbury that the raw River Thames could be purified to a wonderful extent. For example, the ten worst samples of the river water and of the outlet from the first tank gave, on the average, colour estimations of 155 and 37 respectively, a reduction of 76%. *B. coli* was found to be absent from 10,000 c.c. of the treated water, on ten separate days.

The method has disadvantages: for example, the cost, the difficulties attendant upon the neutralization of the excess of caustic alkalinity and the problem of disposing of lime sludge in the case of hard waters. On the other hand, the advantages are considerable. Questions of taste are eliminated. Hard waters may be softened and soft waters hardened by the process. Hard impure waters are not only softened and rendered safe bacteriologically but improved greatly, as judged by physical and chemical standards.

Water Tests.—The physical, chemical and bacteriological tests used in the examination of waters have not altered very materially during recent years. Physically, observations are made of the colour (using a colour meter), turbidity (gravimetrically, or with some form of turbidimeter) and opacity (as shown, for example, by passing a beam of light through the water), etc. Chemically, the chief tests are still for ammoniacal, albuminoid and oxidized nitrogen, chlorides, oxygen absorbed from permanganate, hardness, etc., although new tests, like the determination of the hydrogen-ion concentration, are being used extensively. Bacteriologically, the number of bacteria (especially at 37° C) and the *B. coli*

test still hold the field. In connection with the latter test, a vast amount of work has been done, but we are still uncertain what significance should be attached to the various races of *B. coli* encountered in water analyses. The tendency is to insist on the possession of, say, two positive attributes (lactose+indol+) which characterize human faecal microbes and then judge the matter on a *quantitative* basis. On the whole, the attempts to differentiate between *B. coli* of human intestinal origin and those derived from the lower animals, fish and birds have been most disappointing. The modern teaching is that as it is economically possible, by adequate purification processes, to eliminate (or nearly so) all "lactose+indol+*B. coli*," this standard should always be aimed at. Speaking generally, nearly all are agreed that there should be no *B. coli* of the kind referred to in 100 c.c. of water in more than half of the samples examined.

The interpretation of results has altered considerably during recent years, especially in those cases where chlorination is practised. The tendency is rather in the direction of condoning certain imperfections of quality (*e.g.*, the amount of organic matter present) provided that *B. coli* is killed. It is considered that if *B coli* is destroyed the occurrence of epidemic water-borne diseases is impossible and that therefore other inferential indices of safety lose much of their significance. But those who cling to past traditions regard chlorination as a short cut to apparent rather than real purity.

Natural Methods.—These methods of purification have not been neglected of late years. The value of storage is being increasingly recognized. The three factors making for safety are equalization, sedimentation and devitalization. By equalization is meant the dilution and averaging of any sudden access of pollutions to the water "feeding" a storage reservoir. Sedimentation means the settling out of solid impurities. Devitalization implies the gradual extinction of undesirable bacteria under conditions of storage which are unfavourable to the continued vitality of pathogenic microbes. Nature's method of purification has certain disadvantages. Just as some things die, so do others multiply, sometimes with embarrassing results. There are the diatoms, the protozoa, green and blue growths, etc. Some of these growths give rise to taste troubles (*e.g.*, tabellaria, synura, uroglena, etc.); others exercise a serious blocking or choking effect on sand filtration processes (*e.g.*, asterionella, synedra, cyclotella, fragilaria, etc.). Copper sulphate (in doses of 0·1 to 1·0 per 1,000,000; 1 to 10 lb. per 1,000,000 gal.) has been proved to be a valuable algicidal agent. The smaller doses have no injurious action on fish, but with the maximum doses care is needed, especially with trout.

Filters.—A new and interesting development is the suggestion that rapid (mechanical) filters should be used to remove nearly all the suspended matters (including algal and other growths) from water, and worked at the very rapid rate of 100–200 gal. per sq.ft. per hour. In order to cover the additional cost involved it is hoped that it may be feasible to work slow sand filters at six instead of two gal. per sq.ft. per hour as a final filtration process. The underlying idea is that slow sand filters might be worked considerably faster than is usual if rapid filters were used antecedently to remove the bulk of the suspended matters. Those who favour these departures usually advocate chlorination as an additional safeguard, or, at all events, as a stand-by measure.

WATER RIGHTS. By the law of England the property in the bed and water of a tidal river is presumed to be in the Crown or as a franchise in a grantee of the Crown, and to be extra-parochial. The bed and water of a non-tidal river are presumed to belong to the person through whose land it flows, or, if it divide two properties, to the riparian proprietors, the rights of each extending to midstream (*ad medium filum aquae*). In order to give riparian rights, the river must flow in a defined channel, or at least above ground. The diminution of underground water collected by percolation, even though malicious, does not give a cause of action to the owner of the land in which it collects, it being merely *damnum sine iniuria*, though he is entitled to have it unpolluted unless a right of pollution be gained against him by prescription. The right to draw water from another's well is an easement (*q.v.*) not a *profit à prendre*, and is therefore claimable by custom. As a general rule a riparian proprietor, whether on a tidal or a non-tidal river, has full rights of user of his property. Most of the statute law will be found in the Fishery Harbours Act, 1915, and the Salmon and Freshwater Fisheries Act, 1923. In certain cases the rights of the riparian proprietors are subject to the intervening rights of other persons. These rights vary according as the river is navigable or not, or tidal or not. For instance, all the riparian proprietors might combine to divert a non-navigable river, though one alone could not do so as against the others, but no combination of riparian proprietors could defeat the right of the public to have a navigable river maintained undiverted. We shall here consider shortly the rights enjoyed by, and the limitations imposed upon, riparian proprietors, in addition to those falling under the head of fishery or navigation. (*See* also FORESHORE.)

The right of use of the water of a natural stream cannot be better described than in the words of Lord Kingsdown in 1858: "By the general law applicable to running streams, every riparian proprietor has a right to what may be called the ordinary use of water flowing past his land—for instance, to the reasonable use of the water for domestic purposes and for his cattle, and this without regard to the effect which such use may have in case of a deficiency upon proprietors lower down the stream. But, further, he has a right to the use of it for any purpose, or what may be deemed the extraordinary use of it, provided he does not thereby interfere with the rights of other proprietors, either above or below him. Subject to this condition, he may dam up a stream for the purposes of a mill, or divert the water for the purpose of irrigation. But he has no right to intercept the regular flow of the stream, if he thereby interferes with the lawful use of the water by other proprietors, and inflicts upon them a sensible injury" (*Miner* v. *Gilmour*, 12 Moore's P.C. Cases, 156). The rights of riparian proprietors where the flow of water is artificial rest on a different principle. As the artificial stream is made by a person for his own benefit, any right of another person as a riparian proprietor does not arise at common law, as in the case of a natural stream, but must be established by grant or prescription. If its origin be unknown the inference appears to be that riparian proprietors have the same rights as if the stream had been a natural one (*Baily* v. *Clark*, 1902, 1 Ch. 649). The rights of a person not a riparian proprietor who uses land abutting on a river or stream by the licence or grant of the riparian proprietor are not as full as though he were a riparian proprietor, for he cannot be imposed as a riparian proprietor upon the other proprietors without their consent. The effect of this appears to be that he is not entitled sensibly to affect their rights, even by the ordinary as distinguished from the extraordinary use of the water. Even a riparian proprietor cannot divert the stream to a place outside his tenement and there use it for purposes unconnected with the tenement (*McCartney* v. *Londonderry and Lough Swilly Rly. Co.*, 1904, A.C. 301).

The limitations to which the right of the riparian proprietor is subject may be divided into those existing by common right, those

gether to form a siphon by means of which air is conducted to the tracheae at the apex of the abdomen when the tip of the tube is thrust above the surface of the water. In immature forms the siphon is undeveloped and breathing takes place through six pairs of abdominal spiracles. The eggs, laid in the stems of plants, are supplied with seven filamentous processes which float freely in the water. In the allied genus *Ranatra* both body and legs are slender and elongate. It is the common genus in the United States, *R. fusca* being a well-known species.

WATERSHED, the land-form separating the head streams tributary to two different river basins. Alternative terms are "water-parting" and "divide" (*q.v.*). In an area such as the central plain of Ireland the watershed is often indistinct, as the headwaters of two different river systems may merge in marshy lands at their highest levels. Moreover, where two streams, flowing in opposite directions from adjacent sources, are both gradually cutting back the land at their heads, a "col" (*q.v.*) is formed. In such cases, where one stream "erodes" faster than the other, the stronger may ultimately "behead" the weaker, and "capture" some of its waters, whose flow is thus diverted from one basin to another.

WATERSPOUT, the name applied to the funnel-shaped cloud of the tornado (*q.v.*) when it occurs at sea. The funnel point seems to descend slowly from the lower side of the heavy nimbus clouds. Beneath this point the sea appears agitated and a cloud of spray forms, into which the funnel point dips, and the whole has the appearance of a water column which (by eye estimation) has been given as 20 to 30 ft. in diameter and 250 to 300 ft. high; the bulk of the liquid in the column consists of rain-water. The top usually travels more quickly than the base, and the spout assumes an oblique form. The phenomenon seldom lasts as long as 30 minutes, and though the whirling wind in its vicinity is violent the effects are strictly local.

WATER SUPPLY. A sufficient supply of potable water is essential to man. The word potable means that the water shall be bright, clear and sparkling, free from suspended matters, reasonably soft, free from chemical poisons and in such condition that it cannot cause typhoid fever, cholera, diarrhoea or other water-borne disease, nor have any injurious action on metals. The water should be available at such pressures as will enable a supply by gravity to reach the upper floors or cisterns.

Water is needed for domestic purposes, including sanitation, also for industries, where a high degree of purity is often needed. The availability of suitable supplies determines the location of such industries. Water must also be supplied for fire extinction, street watering, supplies to public buildings and institutions and the flushing of sewers.

Estimation of Requirements.—A local estimate should be made of the average daily quantity which will be required in from 25 to 50 years' time. This estimate involves the prediction of the probable increase of population and of the quantity to be used for all purposes expressed in gallons per head per day. Factors involved are the character of the town, the habits of the people and the various industries which are established or likely to be established. The rate per head varies widely not only throughout any particular country but also as between countries. General experience indicates that almost invariably the rate per head shows an upward trend.

For example a small country town in England where there is but little industrial usage may require 18 or 20 gallons: a large commercial city may use for all purposes 35 or 40 gallons, and in America supplies up to 100 gallons are fairly common and in several instances in the United States much larger quantities are used. Liverpool may be cited as a typical large city and of the total supply of 34·7 gallons per head in 1927 domestic purposes account for 21·7 gallons, trade and shipping (supplied by meter) 9·1 gallons, public purposes 1·6 gallons and sundry other purposes including fire extinction 3·3 gallons.

In America the higher consumption is partly due to a higher standard of living and a more lavish use of water and partly to waste due to faulty house fittings and to leaky distribution mains; an analysis of statistics covering 136 American cities having a population exceeding 25,000 shows that, on the average, where less than 10% of the services are metered the consumption per head is 128 gallons, whilst with 50% or more metered services the consumption is only 52 gallons.

Consumption and Distribution.—The variations in consumption have also to be considered in designing aqueducts and distribution works. The aqueduct by which the water is carried from the source of supply to the town terminates in a main service reservoir, and the capacity of this reservoir depends, in both gravitation and pumping schemes, upon (a) the fluctuations in supply during the maximum day, week and month as compared with the average; (b) on the time required to repair a break in the aqueduct; and (c) on the reserve required to meet the probable maximum demand in case of fire. In addition to main service reservoirs there are minor service reservoirs with capacities of about 250,000 gallons up to 4,000,000 gallons.

The maximum hourly demand for a town with a population of several hundred thousand will be 50% to 100% in excess of the average hour taken over the day: the demand of the maximum day will be 20–40% in excess of the average day's demand: the maximum week will exceed the average week by 15–30% and the maximum four weeks will exceed the average four weeks by 10–20%.

The hourly fluctuations and to some extent the daily fluctuations are usually catered for in the minor service reservoirs which will also be first drawn upon in the event of fire, but the storage to meet the fluctuations over longer periods and the reserve to cover periods when the aqueduct may be out of commission is provided in the main service reservoir, and this in practice would have a capacity equal to 2–4 days of the average supply in the case of a gravitation supply; this storage would be increased if the aqueduct traversed ground liable to subsidence and reduced if the ground were good and the aqueduct, where of pipes, was in duplicate with fairly frequent cross connections. Where a supply is pumped the aqueduct, or rising main, is usually fairly accessible, and pumping machines in duplicate, so less storage would be sufficient. Should the pumps work only part of the day the storage must also be capable of meeting the demand when the pumps are idle.

The amount of water required as a special reserve for fire extinction is usually small as compared with that necessary for other purposes, and is sometimes neglected, but an approximate rule applicable to industrial towns in Britain is that $80{,}000\sqrt{x}$, when x is the population in thousands, will give the extra storage in gallons. This storage should be available in the minor service reservoirs, and should be appropriate to the particular district and population supplied by each such reservoir.

Whilst the distribution mains should be capable of meeting the maximum hourly demand, the criterion which really decides their capacity, especially in sub-districts, is the demand for fire extinction, and for this purpose the distribution mains should be capable of carrying $\frac{750}{\sqrt{x}}\%$ of the average hourly rate of ordinary consumption. Thus in a sub-district having a population of 2,250 the average day's supply might be 72,000 gallons, the average hour therefore being 3,000 gallons and the maximum hour of the maximum day $3{,}000\times1{\cdot}75\times1{\cdot}25=6{,}600$ gallons, whereas the fire demand would be $\frac{750}{\sqrt{2{\cdot}25}}=500\%$ of 3,000 or 15,000 gallons an hour, and the main should therefore be capable of carrying 21,600 gallons an hour.

Source of Supply.—Schemes of water supply may be divided broadly into two groups according to the general source, and the method of collection. In the first or surface water group we have (1) rain water collected from roofs, etc.; (2) water from (a) upland rivers, (b) lowland rivers; and (3) water from lakes. In the second or ground water group we have water derived from (1) springs; (2) shallow wells; (3) deep and artesian wells; and (4) horizontal galleries. Whilst rain water from roofs or specially constructed tanks and ground water from shallow wells may, in general, be sufficient for individual supplies or for small groups

of consumers, such supplies are not suitable for public supplies and are therefore not further considered here.

Public water supplies may, from the nature of the works required, be divided into two broad groups—gravitational and pumping schemes. Gravity supplies may be obtained from upland rivers and sometimes from elevated lakes and springs, whilst supplies obtained from lowland rivers, deep wells, horizontal galleries, and sometimes from low level lakes and artesian wells, involve pumping.

Gravitational Schemes.—In the case of upland supplies the amount of storage provided must be such as will afford continuity of supply and the elevation should be such that when the reservoir is drawn down to the lowest draw-off level, it not only commands the greater part, if not all, of the area to be supplied, but also allows for the necessary fall to overcome the friction in the aqueduct and for the loss of head in filtration.

As most impounded waters are soft, it is now usual to install filters at the head of the aqueduct, and, during or after the filtration process, the water is so treated as to have a small residual alkalinity which inhibits any deleterious action on the materials, especially pipes, of which the aqueduct may be constructed. Whereas a large main conveying soft moorland water may have its capacity reduced by as much as 40% by tuberculation or nodular encrustation within twenty years, the same main conveying filtered and hardened water will not suffer any appreciable reduction in carrying capacity. In the older aqueducts, the only way of maintaining a reasonable capacity is by mechanical scraping at intervals, but once this process is adopted, it is found that the necessity of scraping increases in frequency as time goes on.

The necessity for filtration and hardening or softening of spring waters depends upon the possibility of pollution and the geological formation from which the springs derive their water.

Pumping Schemes.—Where the source is a lowland river or a low level lake the water may be abstracted by means of a simple intake or intakes protected by duplicate screens leading to a sump from which the water is pumped into sedimentation basins, and after a period of storage depending upon the amount of matter in suspension and other factors it is filtered, hardened or softened, and, if necessary, sterilized, and finally pumped into the service reservoir. Where the water is derived from deep wells or from infiltration galleries in the pervious bed or banks of a river, sedimentation is not required and, generally, filtration is unnecessary, though such waters may require softening and sterilization.

Choice of Source.—Recent developments in the methods of water purification have made it possible to consider many waters as potentially suitable for public supply purposes which but ten or twenty years ago would have been entirely ruled out. It follows that the choice between utilising a relatively pure water from a distant elevated source or a water of a much lower standard from a nearer source which calls for pumping and greater working cost in filtration and other treatment, is now largely a question of cost of water. This means the cost per 1,000 gallons delivered at the main service reservoir after taking into account interest and sinking fund charges and annual working expenses—cost of labour, chemicals, fuel, repairs and maintenance.

The initial cost of water from a gravitation scheme is usually high because the impounding reservoir and all or part of the aqueduct must be constructed at the outset of sufficient size to meet the ultimate requirements, although the initial demand may be but 20 or 25% of the ultimate. Another factor, which applies particularly to British work, is that it has been the practice of Parliament to insert a Clause in the Act authorising the construction of impounding reservoirs whereby one-tenth to one-third of the yield of a catchment area is to be released in a more or less regular flow from the reservoir as "compensation water," and this of course may place a serious additional burden on the undertakers. In the United States the riparian and other interests are most frequently compensated by monetary payments.

It is therefore evident that for the economical development of impounding schemes, a relatively large initial demand is desirable and this, in a measure, explains the modern tendency to the formation of joint Water Boards with the consequent reduction in the cost of water to each constituent authority.

In a pumping scheme, on the other hand, the initial capital expenditure is, as a rule, much smaller, and the working expenses are larger but roughly proportionate to the quantity of water pumped. The capacity of such schemes can also be augmented from time to time as required to keep a few years ahead of the demand at relatively small cost, whereas when the demand is approaching the yield of an impounding reservoir it is necessary to construct another similar reservoir and duplicate increasingly long lengths of the aqueduct, so that it is usually advantageous for a single authority to embark on a pumping scheme where there is any choice.

Impounding Reservoirs.—The considerations which determine the capacity of the impounding reservoir are dealt with under RESERVOIRS, and the type of dam by which the reservoir may be created under DAM. It may, however, be emphasized that frequently as much as 30 or 40% of the cost of the dam may be expended on subsurface works for preventing undue leakage through pervious beds under the structure or round its flanks, and a masonry dam may have to be carried to considerable depths to ensure that the structure rests upon material strong enough to withstand the loading which is the resultant of the water pressure and the weight of the dam itself.

An essential preliminary to the selection of the site for a dam is a thorough geological investigation of the area within the limits assigned to the dam, and a general examination of the valley above the dam; such an investigation will not only prevent waste of money in locating a dam at an unsuitable site, but will also enable a much closer estimate of the cost of the work than would otherwise be possible. In this connection the use of boreholes only as a means of exploration is insufficient, and may lead to erroneous conclusions: they should be used to supplement the results obtained from trial shafts and to clear up doubtful points.

The cementation process by means of which cement is injected under pressure through drilled holes over the site of a dam, has of recent years been used to strengthen rock which otherwise might have had insufficient strength, and also to seal up fissures and joints through which water might escape. This process therefore makes it possible to use sites or structures which might otherwise have been considered unsuitable, and in more favourable sites, to reduce the extent of the subsurface work.

Gravitation Aqueduct.—In fixing the size of the various portions of the aqueduct an allowance over the average daily supply which the aqueduct is intended ultimately to carry, apart from any allowance required to meet loss of capacity due to encrustation, must be made to cover the filling up of the terminal service reservoir after depletion consequent upon a burst in the aqueduct, and also to cover seasonal variations. The precise allowance depends on the length of the aqueduct, its liability to interference, accessibility and the economic possibilities of terminal storage; in general 10 per cent. would be sufficient: this might be reduced if a relatively large storage—5 or 6 days—could be economically obtained at the end of a long and costly aqueduct, and increased if the aqueduct were short or only 2 or 3 days' storage could be obtained. The aqueduct is chiefly of cut and cover or tunnel with relatively short connecting lengths of pipe line or lines where the general route can more or less contour the hillsides, or entirely or chiefly of pipe line with short intervening lengths of tunnel where the route crosses hills.

The tunnel and cut and cover portions are made capable of taking the ultimate yield of the source: for this quantity two or more pipe lines, side by side, may be required, but initially only one line would be laid, the others being added wholly or in part and cross-connected to the original line and to each other as the growth of demand necessitates. These portions act also as break-pressure tanks, so that the maximum pressure to which any particular length of pipes is subjected is that corresponding to the top water level in the preceding tunnel or cut and cover.

When of appreciable length, the tunnel and cut and cover portions should be provided with automatic self-closing outlet valves

designed to close when the flow exceeds the normal by more than a predetermined amount, to prevent undue loss of water in the event of a burst in the ensuing pipes, and each pipe should have a reflux valve at its termination to prevent loss of water in the other direction. Where an aqueduct consists wholly of pipes, break-pressure tanks of relatively small capacity are located at suitable high points, and the inlet to these tanks is controlled by some form of float regulator to prevent loss by overflow, and the outlet by a self closing valve. To facilitate testing and repairs, long mains are provided with stop-valves at intervals of about 1½–2 miles with scour valves at depressions, and air valves at all summits. Where the lining is with either cement, mortar or bitumen, it is well to combine the air-valve and an access manhole to facilitate the making of joints. Where unlined pipes, liable to encrustation, are used, hatch pipes should be provided for the passage of the "scraper." Additional air valves are provided in any long lengths of main which are laid to flat gradients, or at any sudden change of gradient.

Pumping Machinery.—Where coal is available of suitable cost and quality, the triple expansion steam engine using superheated steam is still the most efficient pump against a constant head. Where centrifugal pumps are used they may be driven by steam turbines. The Diesel Engine has proved so reliable in ship propulsion, that it is being widely used. It is equally efficient in large and small units. Where electric current is cheap, motor driven pumps are frequently adopted: better terms can be obtained if the pumping avoids the peak hours of the generating station, and automatic controls can be installed to effect this.

For intermittent work or small quantities, electric motors, oil engines, or gas engines, may be used.

Where the suction lift does not exceed about 25 feet either direct acting or centrifugal pumps may be used: where the suction lift exceeds this limit, three-throw plunger pumps may be used in conjunction with a suction well of ample size, or where space is a consideration, as in a borehole, vertical spindle turbine centrifugal pumps may be employed.

Where water has to be raised from great depths by means of boreholes, the air-lift pump is frequently the only arrangement available: it has the advantage of having no moving parts, and although its efficiency is low it is considered to have advantages in certain cases, which compensate for the lack of efficiency.

Rising Main.—In contradistinction to a gravitation supply, where the general hydraulic gradient and therefore the dimensions of component parts of the aqueduct are, for a given capacity, fixed within close limits by the levels of the impounding and main service reservoirs, the hydraulic gradient of the rising main is determined by purely economic considerations. The terminal level, *i.e.*, the top water level of the service reservoir, is fixed by the level of the area to be supplied from that reservoir, but the head against which the pumps are designed to work, and which determines the hydraulic gradient under which the rising main will operate, must be above that due to the service reservoir.

The carrying capacity of the main is a function of its size and hydraulic gradient: the flatter the gradient the larger the pipe and the smaller the head against which the pumps will operate, for, in addition to the purely static lift given by the difference between the level in the suction well and the level in the service reservoir, there is the friction head which is the product of the hydraulic gradient and the length of the main. Conversely, a smaller and less costly pipe may be used at the expense of increasing the pumping head, the size of the pumping units, and the cost of pumping. In its simplest terms, the economic size of the rising main is that diameter for which the sum of the interest and sinking fund charges on the cost of the pipe line, the pumping units and the building, the service reservoir and filters (if required) and of the annual working expenses, is a minimum.

Service Reservoir.—When the main service reservoir is supplied with filtered water or deep well water it is usually covered in order to prevent contamination and algal growths. Covering also helps to maintain the water at an even temperature and, especially in hot climates, prevents loss of water by evaporation. Even if reservoirs are not covered initially, it frequently happens that the building up of the surrounding land has rendered covering necessary, and as this can only be done by throwing the reservoir out of commission, it is really economy to cover all but the largest reservoirs at the outset. The smaller service reservoirs are located in populous districts and are invariably covered.

Both large and small reservoirs are constructed of concrete, reinforced concrete or brickwork and concrete. They may be rectangular, circular or hexagonal in plan, and their shape depends not only upon the contour of the ground, but also to some extent on the form of roof covering. For capacities up to one million gallons, the economic depth may be from 10 to 12 feet, whilst at 30 millions, the depth may be 30 feet. Usually service reservoirs are surrounded by an earthen bank and the roof is soiled over.

The concrete floor is usually flat with sufficient fall for drainage during cleaning, and in all but the smallest reservoirs, a division wall of part or full height may be provided to enable a part of the storage to be available during cleaning. The roof may be of flat reinforced concrete slabs resting upon a system of main and secondary beams of reinforced concrete, or steel beams encased in concrete. It may consist of longitudinal arches in brickwork or concrete, which spring either from girders or from transverse flying arches, these arches being supported on massive piers, or, as is frequently found in American practice, the piers may support a system of concrete groined arches. Still another and economical form of covering consists of a series of relatively thin plain concrete domes springing from concrete groined arches which, in turn, are supported by hexagonal concrete block columns. Ample provision for ventilation should be made especially in tropical countries, and in these countries mosquito netting is essential.

Apart from the main service reservoir it is usual to provide one or more minor reservoirs upon suitably elevated sites to meet the hourly and possibly daily fluctuations of supply in the more or less immediate vicinity, and to hold an appropriate reserve for fire extinction. Where no site at the required elevation is available, watertowers supporting elevated tanks of cast iron, steel or reinforced concrete, holding 20,000 to 500,000 gallons, and standing 50 to 100 feet above the ground, are used. Minor service reservoirs, located at the ends of main distribution pipes remote from the main service reservoir, are advantageous in that they enable smaller and less costly connecting mains to be used, and also give more regular pressures in the districts served.

Distribution.—There are two methods of charging for domestic supplies: as in Britain, it may be by a water rate at so much per cent. of the annual value, or, as in many American and Continental cities, at so much per 1,000 gallons by meter. Where the supply is metered, it is to the user's interest to maintain his fittings in proper condition, and in America, the introduction of meters invariably leads to a considerable reduction in consumption.

Quite apart from leaky fittings there may be loss of water in the distribution mains, and in a well-organised Water Department, the detection and prevention of leakage and waste is an important part of the work of maintenance.

The outflow from all service reservoirs should be metered, and a close observation of the rates of flow during the night hours will indicate whether there is any serious loss of water in the area supplied from that reservoir. For more detailed observations, the town is divided up into districts, the night supply to each of which can by an appropriate system of valve control be made to pass through a Deacon Differentiating Waste Water Meter. This meter carries a paper diagram mounted on a drum, which is caused by clockwork to revolve uniformly; each house service is controlled by a stop cock accessible to the Waterworks Officials; these cocks are closed in turn and the time of doing so is noted; where there is leakage taking place the closing of the cock will cause a step in the diagram, and the time at which the step occurs will, on reference to the night inspector's log, enable that particular house to be located. The fittings in that house are examined and the user is called upon to remedy the defects which are notified.

When all the stop cocks in the district have been closed, there may still be a flow recorded on the meter, and this represents leakage from the distribution system which may, as a rule, be readily

located by a stethoscope in the hands of an experienced man. The modern practice of re-surfacing roads with reinforced concrete adds considerably to the cost of mending defects in mains.

Native quarters in tropical towns are usually supplied from stand pipes, and unless these are very frequently inspected and well maintained, serious loss of water may occur.

Distribution System.—Where the area of supply has a wide range of level, it is usual to divide it up into zones each commanded by a service reservoir or water tower at an appropriate elevation in order to prevent the pipes and fittings being subjected to excessive pressure with consequent increased liability to loss and waste of water, or the same result may be obtained by the use of pressure reducing valves. The same principle is adopted also when the higher districts have to be supplied by pumping, or repumping, in order to restrict the quantity of water pumped to that requisite for the higher districts only. Where current is available electrically driven centrifugal pumps are installed, and automatically come into action when the level in the upper reservoir falls to a pre-determined level: it can also be arranged that the pumping shall be confined to certain hours if by so doing, the peak hours at the generating station are avoided, and a more favourable tariff for current is thereby obtained.

The general requirements of a satisfactory distribution system are, well laid mains of durable material, laid at such depths as will prevent damage by frost or traffic, of sufficient capacity to meet all demands at an adequate pressure, usually not less than 3 inches internal diameter, and so arranged and intercommunicated that in the event of a burst or for any other reason, a small section may be isolated rapidly; a sufficiency of hydrants appropriate to the various parts of the district; master meters registering the quantities delivered into the several districts; and adequate means of detecting leakage and waste.

Mains.—The mains may be of cast iron, steel, galvanised iron or asbestos-cement. The cast iron and steel pipes may be simply coated internally and externally with Dr. Angus Smith's Solution where the ground in which the pipes are laid has no adverse effect on metals and where the water has sufficient alkalinity to inhibit corrosion or incrustation.

If the water is soft or otherwise likely to cause tuberculation, such pipes should either be of larger diameter to allow for the falling off in carrying capacity, or the pipes must be lined with cement mortar or bituminous compound, and the nature of the lining is not only a question of cost, but also of suitability for the particular water supplied. The thickness of the lining depends upon the size of the pipe, being thinner in the smaller pipes.

The choice of a special type of lining may restrict its use to pipes of such a size that a person can enter them if the making good of the internal joints from the inside is necessary in order to secure continuity in the lining, and this consideration more particularly affects steel pipes, where the consequences of pitting are relatively of greater importance than in the much thicker cast iron pipes.

For protection against external corrosion coated steel pipes may be effectively protected by wrapping with Hessian cloth impregnated with hot bitumen, but great care has to be taken to prevent damage to this wrapping. Where the ground in which the pipes are to be laid contains particularly aggressive constituents, it may be necessary to surround the pipes with concrete or to refill the trench with other and more suitable earth. In tropical countries, where aqueduct mains traverse bad ground, they may be laid on or above the surface, but in such cases expansion and contraction, in the absence of expansion joints, may give rise to leaky joints, though a lead joint, with a depth of lead of 3 inches, under pressure of 200 to 300 feet, will allow of a movement of as much as an inch without leakage.

Joints.—The joints in metal mains are usually of the socket and spigot type made with yarn and lead: of recent years various proprietary substitutes for lead have been used, chiefly in America, with the view to eliminating that caulking which a run lead joint requires, and cement caulked in an almost dry state instead of lead has also been adopted with some measure of success. Galvanised pipes with screwed joints are frequently used for the smaller distribution mains, especially in tropical countries where freight and transport are heavy items of expense.

In Italy asbestos-cement pipes have been used of recent years instead of cast iron pipes in sizes ranging from the smallest distribution pipe up to large trunk mains. These pipes are made with double spigots and jointed by means of collars either of the same material or of cast iron with inserted rubber rings. With most waters and in ordinary ground they are not liable to deterioration, either inside or out.

WATER-THYME (*Elodea canadensis*), a small submerged water-weed, native of North America; it is also known as American water-weed. It was introduced into co. Down, Ireland, about 1836, and appeared in England in 1841, spreading through the country in ponds, ditches and streams, which were often choked with its rank growth. *Elodea* belongs to the family Hydrocharitaceae, which includes also the frog-bit (*Hydrocharis Morsus-ranae*), the water-soldier (*Stratiotes aloides*) and the eel-grass (*Vallisneria spiralis*).

WATERTOWN, a town of Massachusetts, on the Charles river. Pop. (1920) 21,457 (27% foreign-born white); 1928 local estimate 32,500. There are two interesting old burying grounds, one of which has been in use since 1642, and a number of colonial houses. The town includes mounds and earthworks thought by Prof. E. N. Horsford to be remains of a Norse settlement of the 11th century. The Federal Government maintains one of its principal arsenals at Watertown, occupying 100 ac. along the river. Several of the original low brick buildings (1816–20) are still in use. The town has numerous and varied manufactures, with an annual output valued at $60,000,000. Watertown was one of the earliest of the Massachusetts Bay settlements, founded in 1630 by Sir Richard Saltonstall and the Rev. George Phillips, and for the first quarter century it ranked next to Boston in population and area. Since then its territory has been greatly reduced. The first protest in America against taxation without representation was made by the people of Watertown, on the occasion of a levy for erecting a stockade fort in Cambridge. The first grist mill in the Colony was established here about 1632, and one of the first woollen mills in America in 1662. Here the Provincial Congress met from April to July 1775; the Massachusetts general court from 1775 to 1778; and the Boston town meetings during the siege of Boston. For several months early in the Revolution the committees of safety and correspondence made Watertown their headquarters, and from here Gen. Joseph Warren set out for Bunker Hill. Theodore Parker conducted a private school in Watertown from 1832 to 1834.

WATERTOWN, a city of northern New York, U.S.A. It has a municipal airport. Pop. (1920) 31,285 (81% native white); 1928 local estimate 35,000. The Thousand islands are 22 m. N. and the Adirondacks 45 m. N.E. The city's parks include one of 196 ac., two large athletic fields, municipal golf links, swimming pools and children's playgrounds. There is a beautiful public library (1904), a memorial to Governor Roswell P. Flower, whose home was here. Among the products are automobile bodies, railroad air-brakes, brass plumbing supplies, paper, silk fabrics, knitted silk garments, shirts, women's coats, electrical machinery, flour and breakfast foods, thermometers and optical goods. The city owns a hydro-electric plant of 7,500 h.p. (opened 1927).

Since 1920 it has had a city-manager. The charities are financed through a community chest. Watertown was founded in 1800, and named after the water-power, which has been used since 1802. It was incorporated as a city in 1869. The first portable steam engine made in the United States was made in Watertown in 1847, and here in 1878 F. W. Woolworth established the first five and ten cent store.

WATERTOWN, a city of South Dakota, U.S.A., on the Big Sioux river, near Lake Kampeska and Lake Pelican, 200 m. W. of Minneapolis. Pop. (1925 State census) 10,319. The city has a large meat-packing plant, flour mills and machine shops. The city was founded in 1882 and incorporated in 1885.

WATERTOWN, a city of Wisconsin, U.S.A., on the Rock river. Pop. 9,299 in 1920, 84% native white. It is the seat of Northwestern college (Lutheran, 1865); a shipping point for butter and cheese; a market for imported horses. Watertown was founded about 1836 by colonists from Watertown, N.Y. Later, especially after 1848, there was a large influx of Germans, including Carl Schurz, who began his law practice here. The village was incorporated in 1849 and chartered as a city in 1853.

WATER TURBINE: *see* TURBINE, WATER.

WATER-TURKEY, the popular name in U.S.A. for the American darter (*Anhinga anhinga*). (*See* SNAKE-BIRD.)

WATERVILLE, a city of Maine, U.S.A. Pop. (1920) 13,351 (22% foreign-born white); 1928 local estimate 14,500. Water-power from the Ticonic falls, and more recently an ample supply of hydro-electric current, have made Waterville an important manufacturing centre. It has large cotton and worsted mills and many other plants, and in Winslow, directly opposite, is one of the largest pulp and paper mills of New England. The city is the seat of Colby college, founded in 1813 as the Maine Literary and Theological Institution. The Belgrade lakes are 10 m. W. of the city and some of the best fishing-grounds in the State are in the vicinity. Settlement here began about the middle of the 18th century. Waterville was set off from Winslow and incorporated as a town in 1802. In 1883 it was incorporated as a city, adopting a city charter in 1888.

WATERVLIET, a city of New York, U.S.A. Pop. (1920) 16,073 (84% native white); 1928 local estimate 22,500. It has railroad shops and extensive manufactures of bells, iron and steel castings, stoves, ladders, woollen goods, paper and wooden boxes, asbestos products, spun silk, men's clothing and various other commodities, with an aggregate output in 1925 valued at $9,480,203. Within the city limits is a U.S. arsenal (1807). Watervliet was originally called West Troy. It was incorporated as a village in 1836 and as a city (under its present name) in 1896. Since 1918 it has had a commission-manager form of government. In 1776 "Mother Ann" Lee and her followers established the first Shaker settlement in America near the present site of Watervliet.

WATERWAYS: *see* CANALS AND CANALIZED RIVERS; INLAND WATER TRANSPORT.

WATFORD, a town of Hertfordshire, England. Pop. (1921) 45,922. The church of St. Mary contains good monumental work of the early 17th century. There are large breweries, also corn-mills, malt-kilns and an iron foundry. Bushey, on the south side of the Colne, is a suburb, chiefly residential, with a station on the L.M.S. line. The church of St. James, extensively restored by Sir Gilbert Scott, has an Early English chancel. Here a school of art founded by Sir Hubert von Herkomer, R.A., was closed in 1904, and subsequently revived in other hands. Other institutions are the Royal Caledonian asylum and the London Orphan asylum. At Aldenham, 2 m. N.E., the grammar school founded in 1599 now ranks as one of the minor English public schools.

WATKINS GLEN, a village of New York, U.S.A., at the south end of Seneca lake, in the heart of the Finger Lake region. Resident pop. (1925) 2,919 (State census). Medicinal springs and the beauty of the "Glen" have made it one of the noted health and pleasure resorts of the country, and 18 brine wells provide raw material for the manufacture of 170,000 tons of salt annually. The most noted of the mineral springs is one on the property of the Glen springs, a large health resort and hotel established in 1890 to provide the "Nauheim treatment" in America. Its properties are similar to those of the springs at Bad Nauheim, but the mineral content is about five times as great. The famous glen is a narrow winding gorge 2 m. long, with walls from 100 to 300 ft. high, through which flows a small stream (with a total descent of 1,200 ft.) in many falls, cascades and pools. It is in a State park of 800 ac., entered from the main street of the village. The first settlement here was made in 1788 by two men from Connecticut. In 1794 came Dr. Samuel Watkins, in whose honour the village was named in 1852, after having been known first as Salubria and incorporated in 1842 as Jefferson.

WATLING STREET, the Early English name for the great road made by the Romans from London past St. Albans (Roman *Verulamium*) to Wroxeter (Roman *Viroconium*) near Shrewsbury and used by the Anglo-Saxons, just as a great part of it is used to-day. According to early documents the name was at first Waeclinga (or Waetlinga) straet; its derivation is unknown; but an English personal name may lie behind it. After the Conquest the road was included in the list of four Royal Roads which the Norman lawyers recorded or invented. (*See* ERMINE STREET.) Later still, in the Elizabethan period and after it, the name Watling Street seems to have been applied to many Roman or reputed Roman roads in various parts of Britain. In particular, the Roman "North Road" which ran from York through Corbridge and over Cheviot to Newstead near Melrose, and thence to the Wall of Pius, and which has largely been in use ever since Roman times, was not unfrequently called Watling Street, though there was no old authority for it and throughout the middle ages the section of the road between the Tyne and the Forth was called Dere Street. For its course near London, see *Royal Comm. on Hist. Monuments, Inventory of London* (1928).

WATSON, JOHN BROADUS (1878–), American psychologist, was born at Greenville, S.C., on Jan. 9, 1878. He graduated at Furman university (M.A. 1900), continuing his studies at the University of Chicago (Ph.D. 1903). After serving as assistant and instructor in experimental psychology at the University of Chicago he was appointed professor of experimental and comparative psychology at Johns Hopkins university in 1908, being also director of the psychological laboratory there until 1920. Later he was a lecturer at the New School for Social Research. He became known as the leading exponent of behaviourism. (*See* BEHAVIOURISM.) In 1917 he served as major in the aviation section of the Signal Corps, U.S. Reserves, and with the A.E.F. He was editor of *The Psychological Review*, 1908–15; he became joint editor of *The Journal of Animal Behavior* in 1910 and editor of *The Journal of Experimental Psychology* in 1915. He wrote *Animal Education* (1903); *Behavior: An Introduction to Comparative Psychology* (1914); *Psychology from the Standpoint of a Behaviorist* (1919); and *Behaviorism* (1925); as well as many scientific monographs and articles.

WATSON, JOHN CHRISTIAN (1867–), Australian politician, was born at Valparaiso, Chile, on April 9, 1867, when his parents were on their way as emigrants to Australasia. He was educated at the public school of Oamaru, N.Z., and as a boy began work as a compositor. He attached himself to the Labour party in politics. He was president of the Sydney Trades and Labour Council in 1890. From 1894–1901 he was a member of the New South Wales legislature. In 1901 he was elected to the Commonwealth parliament, and for a short time in 1904, on the resignation of Deakin, he was prime minister and treasurer. He resigned after a few months, though he continued to lead the Labour party until 1908.

WATSON, THOMAS (*c.* 1557–1592), English lyrical poet, was born in London, probably in 1557. He proceeded to Oxford, and while quite a young man enjoyed a certain reputation, even abroad, as a Latin poet. His *De remedio amoris*, which was perhaps his earliest important composition, is lost, and so is his "piece of work written in the commendation of women-kind," which was also in Latin verse. He came back to London and became a law-student. The earliest publication by Watson which has survived is a Latin version of the *Antigone* of Sophocles, issued in 1581. It is dedicated to Philip Howard, earl of Arundel, who was perhaps the patron of the poet, who seems to have

spent some part of this year in Paris. Next year Watson appears for the first time as an English poet in some verses prefixed to Whetstone's *Heptameron*, and also in a far more important guise, as the author of the *Hecatompathia* or *Passionate Centurie of Love*. This is a collection or cycle of 100 pieces, in the manner of Petrarch, celebrating the sufferings of a lover and his long farewell to love. Although they profess to be sonnets, they are really written in triple sets of common six-line stanza, and therefore have 18 lines each. The metre has had no imitators. In 1585 he published a Latin translation of Tasso's pastoral play of *Aminta*, and his version was afterwards translated into English by Abraham Fraunce (1587).

Watson was now, as the testimony of Nashe and others prove, regarded as the best Latin poet of England. In 1590 he published, in English and Latin verse, his *Meliboeus*, an elegy on the death of Sir Francis Walsingham, and a collection of *Italian Madrigals*, put into English by Watson and set to music by Byrd. Of the remainder of Watson's career nothing is known, save that on Sept. 26, 1592 he was buried in the church of St. Bartholomew the Less, and that in the following year his latest and best book, *The Tears of Fancie*, or *Love Disdained* (1593), was posthumously published. This is a collection of 60 sonnets with 14 lines each. Spenser may have alluded to Watson in *Colin Clout's Come Home Again*, when he says:—

> Amyntas quite is gone and lies full low,
> Having his Amaryllis left to moan.

He is mentioned by Meres in company with Shakespeare, Peele and Marlowe among "the best for tragedie," but no dramatic work of his has come down to us. He was, however, forerunner of Shakespeare (in *Venus and Adonis* and in the *Sonnets*).

(E. G.)

The English works of Watson, excepting the madrigals, were first collected by E. Arber in 1870. *Thomas Watson's "Italian Madrigals Englished"* (1590) were reprinted (ed. F. J. Carpenter) from the *Journal of Germanic Philology* (vol. ii., No. 3, p. 337) with the original Italian, in 1899. *See* also Sir Sidney Lee's Introduction (pp. xxxii.–xli.) to *Elizabethan Sonnets* in the new edition (1904) of *An English Garner*.

WATSON, WILLIAM (*c.* 1559–1603), English conspirator, was born in the north of England, probably on April 23, 1559. In 1586 he became a Roman Catholic priest in France, and during the concluding years of Elizabeth's reign he paid several visits to England; he was imprisoned and tortured more than once. Under James I. he was involved in the "Bye plot," or "Watson's plot." It was arranged that James should be surprised and seized, while the conspirators talked loudly about capturing the Tower of London, converting the king to Romanism, and making Watson lord keeper. One or two of the conspirators drew back; but Watson and his remaining colleagues arranged to assemble at Greenwich on June 24, 1603, and under the pretence of presenting a petition to carry out their object. The plot was a complete failure; Henry Garnet and other Jesuits betrayed it to the authorities, and its principal authors were seized, Watson being captured in August at Hay on the Welsh border. They were tried at Winchester and found guilty; Watson and Clark were executed on Dec. 9, 1603, and Brooke suffered the same fate a week later. Before the executions took place, however, the failure of the Bye plot had led to the discovery of the Main plot. Brooke's share in the earlier scheme caused suspicion to fall upon his brother Henry Brooke, Lord Cobham, the ally and brother-in-law of Sir Robert Cecil, afterwards earl of Salisbury. Cobham appears to have been in communication with Spain about the possibility of killing "the king and his cubs" and of placing Lady Arabella Stuart on the throne. He was seized, tried and condemned to death, but although led out to the scaffold he was not executed. It was on suspicion of being associated with Cobham in this matter that Sir Walter Raleigh was arrested and tried.

See the documents printed by T. G. Law in *The Archpriest controversy* (1896–98); the same writer's *Jesuits and Seculars* (1889), and S. R. Gardiner, *History of England*, vol. i. (1905).

WATSON, SIR WILLIAM (1858–), English poet, born on Aug. 2, 1858, at Burley-in-Wharfedale, Yorkshire, was brought up at Liverpool, whither his father moved for business. In 1880 he published his first book *The Prince's Quest*, a poem showing the influence of Keats and Tennyson, but giving little indication of the author's mature style. Recognition came in 1890 with the publication of *Wordsworth's Grave*, which marked a reversion from the current Tennysonian and Swinburnian fashion to the meditative note of Matthew Arnold. Besides *Wordsworth's Grave* the volume contained *Ver tenebrosum* (originally published in the *National Review* for June 1885), a series of political sonnets indicating a fervour of political conviction which was later to find still more impassioned expression; also a selection with additions from the *Epigrams* of 1884, and among other miscellaneous pieces his tribute to Arnold, "In Laleham Churchyard." There followed: *Excursions in Criticism* (1893), a collection of review articles; *Lacrymae Musarum* (1893); *The Eloping Angels* (1893); *Odes and Other Poems* (1894); *The Father of the Forest* (1895); and *The Purple East* (1896), sonnets on the Armenian question; *Collected Poems* (1902); *Selected Poems* (1903); *For England* (1903); *New Poems* (1909); and also other verse, including *A Hundred Poems* (1922), a selection from various volumes, and *Poems, Brief and New* (1925). In 1917 Watson was knighted.

Sir William Watson's poetry is contemplative, not dramatic, and only occasionally lyrical in impulse. In spite of the poet's plea in his "Apologia" that there is an ardour and a fire other than that of Eros or Aphrodite, ardour and fire are not conspicuous qualities of his verse. Except in his political verse there is more thought than passion. Bearing trace enough of the influence of the romantic epoch, his poetry recalls the earlier classical period in its epigrammatic phrasing and Latinized diction. By the distinction and clarity of his style and the dignity of his movement William Watson stands in the classical tradition.

See also section on William Watson in *Poets of the Younger Generation*, by William Archer (1902); and for bibliography up to Aug. 1903, *English Illustrated Magazine*, vol. xxix. (N.S.), pp. 542 and 548.

WATSONVILLE, a city of Santa Cruz county, California. Pop. (1920) 5,013; 1928 local estimate, including immediate suburbs, 10,000. Over 15,000 ac. of the beautiful fertile Pajaro valley are planted to apples, which supply work for 75–100 packing houses, 25 driers, canneries and cider and vinegar works in the city. Small fruit, vegetables and other agricultural products are also shipped in large quantities. Watsonville was one of the early settlements of the State, founded in 1851. It was incorporated as a city in 1903.

WATT, JAMES (1736–1819), Scottish engineer, the inventor of the modern condensing steam-engine, was born at Greenock on Jan. 19, 1736. His father was a small merchant there, who lost his trade and fortune by unsuccessful speculation. James made his way to London, at the age of nineteen, to be apprenticed to a philosophical-instrument maker, John Morgan, in whose service he remained for twelve months. The hard work and frugal living forced him at the end of a year to seek rest at home, not, however, before he had gained a fair knowledge of the trade and become handy in the use of tools. On his return to Scotland in 1756 he tried to establish himself as an instrument maker in Glasgow, but the city guilds would not recognize a craftsman who had not served the full term of apprenticeship, and Watt was forbidden to open shop in the burgh. The college, however, took him under its protection, and in 1757 he was established in its precincts with the title of mathematical-instrument maker to the university.

Joseph Black, the discoverer of latent heat, then lecturer on chemistry, and John Robison, then a student, afterwards professor of natural philosophy at Edinburgh, became his intimate friends, and with them he often discussed the possibility of improving the steam-engine, the best type of which was at that time the Newcomen engine. It was then applied only to pumping water—chiefly in the drainage of mines; and it was so clumsy and wasteful in fuel that it was little used. Some early experiments of Watt in 1761 or 1762 had no direct result, but in 1764 his attention was seriously aroused by having a model of Newcomen's engine, which formed part of the college collection of scientific apparatus, given him to repair. Having put the model in order,

he was at once struck with its enormous consumption of steam, and set himself to find its cause and remedy.

In Newcomen's engine the cylinder stood vertically under one end of the main lever or "beam," and was open at the top. Steam, at a pressure scarcely greater than that of the atmosphere, was admitted to the under side; this allowed the piston to be pulled up by a counterweight at the other end of the beam. Communication with the boiler was then shut off, and the steam in the cylinder was condensed by injection of cold water from a cistern above. The pressure of the air on the top of the piston then drove it down, raising the counterweight and doing work. The injection water and condensed steam in the cylinder were drained out by a pipe leading down into a well.

After some unsuccessful efforts to remedy the difficulty Watt began a scientific examination of the properties of steam, studying by experiment the relation of its density and pressure to its temperature, and concluded that two conditions were essential to the economic use of steam in a condensing steam-engine. One was that the temperature of the condensed steam should be as low as possible, 100° F or lower, otherwise the vacuum would not be good; the other was, to quote his own words, "that the cylinder should be always as hot as the steam which entered it." In Newcomen's engine these two conditions were incompatible, and not for some months did Watt see a means of reconciling them. Early in 1765, the idea struck him that, if the steam were condensed in a vessel distinct from the cylinder, the temperature of condensation could be kept low and that in the cylinder high. Let this separate vessel be kept cold, either by injecting cold water or by letting it run over the outside, and let a vacuum be maintained in the vessel. Then, whenever communication was made between it and the cylinder, steam would pass over from the cylinder and be condensed; the pressure in the cylinder would be as low as the pressure in the condenser, but the temperature of the metal of the cylinder would remain high, since no injection water would touch it. Without delay Watt put his idea to the test, and found that the separate condenser acted as he had anticipated. To maintain the vacuum in it he added another new organ, namely, the air-pump, the function of which was to remove the condensed steam and injection-water along with any air gathered in the condenser.

To further his object of keeping the cylinder as hot as the steam that entered it, Watt supplemented his great invention of the separate condenser by several less notable but still important improvements. In Newcomen's engine a layer of water over the piston had been used to keep it steam-tight; Watt substituted a tighter packing lubricated by oil. In Newcomen's engine the upper end of the cylinder was open to the air; Watt covered it in, leading the piston-rod through a steam-tight stuffing box in the cover, and allowed steam instead of air to press on the top of the piston. In Newcomen's engine the cylinder had no clothing to reduce loss of heat by radiation and conduction from its outer surface; Watt not only cased it in non-conducting material, but introduced a steam-jacket, or layer of steam, between the cylinder proper and an outer shell.

All these features were specified in his first patent (*see* STEAM-ENGINE), which was obtained in January 1769, nearly four years after the inventions it covered had been made. In the interval Watt had been striving to demonstrate the merits of his engine by trial on a large scale. His earliest experiments left him in debt, and he agreed that Dr. John Roebuck, founder of the Carron ironworks, should take two-thirds of the profits of the invention in consideration of his bearing the costs. An engine was then erected at Kinneil, near Linlithgow, and this gave Watt the opportunity of overcoming many difficulties in details of construction. Meanwhile he was gaining reputation as a civil engineer. In 1767 he was employed to make a survey for a Forth and Clyde canal, which failed, however, to secure parliamentary sanction. During the next six years he made surveys for canals at Monkland, from Perth to Forfar, and along the lines afterwards followed by the Crinan and Caledonian canals. He prepared plans for the harbours of Ayr, Port-Glasgow and Greenock, for deepening the Clyde, and for building a bridge over it at Hamilton. In the course of this work he invented a simple micrometer for measuring distances, consisting of a pair of horizontal hairs placed in the focus of a telescope, through which sights were taken to a fixed and to a movable target on a rod held upright at the place whose distance from the observer was to be determined.

In 1768 Watt had met Matthew Boulton, who owned the Soho engineering works at Birmingham. Boulton agreed to take Roebuck's share in the invention, and to apply to parliament for an act to prolong the term of the patent. The application was successful, and in 1775 an act was passed continuing the patent for twenty-five years. By this time Watt had settled in Birmingham, where the manufacture of steam-engines was begun by the firm of Boulton & Watt. The partnership was a happy one. Boulton left the work of inventing to Watt, in whose genius he had the fullest faith, while he attended to the business side.

During the next ten years Watt developed the engine. Its first and, for a time, its only application was in pumping; it was at once put to this use in the Cornish mines. Further inventions followed in quick succession. Watt's second steam-engine patent is dated 1781. It describes five different methods of converting the reciprocating motion of the piston into motion of rotation, so as to adapt the engine for driving ordinary machinery. The simplest way of doing this was by a crank and fly-wheel; this had occurred to Watt, but had meanwhile been patented by another, and hence he devised "sun and planet wheels" and other equivalent contrivances. A third patent, in 1782, contained two new inventions of great importance. Up to this time the engine had been single-acting; Watt now made it double-acting; that is to say, both ends of the cylinder, instead of only one, were alternately put in communication with the boiler and the condenser. Up to this time also the steam had been admitted from the boiler throughout the whole stroke of the piston; Watt now introduced the system of expansive working, in which the admission valve is closed after a portion only of the stroke is performed, and the steam enclosed in the cylinder is then allowed to expand during the remainder of the stroke, doing additional work upon the piston without making any further demand upon the boiler until the next stroke requires a fresh admission of steam. He observed that, as the piston advanced after admission had ceased, the pressure of the steam in the cylinder would fall in the same proportion as its volume increased—a law which, although not strictly true, does accord very closely with the actual behaviour of steam expanding in the cylinder of an engine. Recognizing that this would cause a gradual reduction of the force with which the piston pulled or pushed against the beam, Watt devised a number of contrivances for equalizing the effort throughout the stroke. He found, however, that the inertia of the pump-rods in his mine engines, and the fly-wheel in his rotative engines, served to compensate for the inequality of thrust sufficiently to make these contrivances unnecessary. His fourth patent, taken out in 1784, describes the well-known "parallel motion," an arrangement of links by which the top of the piston-rod is connected to the beam so that it may either pull or push, and is at the same time guided to move in a straight line.

A still later invention was the centrifugal governor, by which the speed of rotative engines was automatically controlled. Another of Watt's contributions to the development of the steam-engine is the indicator, which draws a diagram of the relation of the steam's pressure to its volume as the stroke proceeds. The eminently philosophic notion of an indicator diagram is fundamental in the theory of thermodynamics; the instrument itself is to the steam engineer what the stethoscope is to the physician.

The commercial success of the engine was not slow. By 1783 all but one of the Newcomen pumping-engines in Cornwall had been displaced by Watt's. The mines were then far from thriving; many were even on the point of being abandoned through the difficulty of dealing with large volumes of water; and Watt's invention, by its economy, gave many of them a new lease of life. His engine used no more than a fourth of the fuel that had formerly been needed to do the same work, and the Soho firm usually claimed as royalty a sum equivalent to one-third of the saving.

Before Watt's time the steam-engine was exclusively a steam-

pump, slow-working, cumbrous and excessively wasteful in fuel. His first patent made it quick in working, powerful and efficient, but still only as a steam-pump. His later inventions adapted it to drive machinery of all kinds, and left it virtually what it is to-day, save in three respects. In respect of mechanical arrangement the modern engine differs from Watt's chiefly in that the beam, an indispensable feature in the early pumping-engines, has gradually given way to more direct modes of connecting the piston with the crank. The second difference is in the modern use of high-pressure steam. It is remarkable that Watt, notwithstanding the fact that his own invention of expansive working must have opened his eyes to the advantage of high-pressure steam, declined to make use of it. He persisted in the use of pressures that were little if at all above that of the atmosphere, while Trevithick ventured as far as 120 lb. on the square inch, a curious episode in the history of the steam-engine is an attempt by Boulton and Watt to obtain an act of parliament forbidding the use of high pressure steam on the ground that the lives of the public were endangered. The third respect in which a great improvement has been effected is in the introduction of compound expansion. Here, too, we find the Soho firm hostile, though the necessity of defending their monopoly makes their action natural enough. Hornblower had in fact stumbled on the invention of the compound engine, but as his machine employed Watt's condenser it was suppressed, to be revived after some years by Arthur Woolf (1766–1837). Watt in one of his patents (1784) describes a steam locomotive, but he never prosecuted this, and when William Murdoch, his chief assistant (famous as the inventor of gas-lighting), made experiments on the same lines, Watt gave him little encouragement. The notion then was to use a steam carriage on ordinary roads: its use on railways had not yet been thought of. When that idea took form later in the last years of Watt's life, the old man refused to countenance it.

On the expiry in 1800 of the act by which the patent of 1769 had been extended, Watt gave up his share in the business of engine-building to his sons, James, who carried it on with a son of Boulton for many years, and Gregory, who died in 1804. The remainder of his life was quietly spent at Heathfield Hall, near Birmingham, where he devoted his time to mechanical pursuits. His last work was the invention of machines for copying sculpture, one for making reduced copies, another for taking facsimiles by means of a light frame, which carried a pointer over the surface of the work, while a revolving tool fixed to the frame alongside the pointer cut a corresponding surface on a suitable block. We find him not many months before his death, presenting copies of busts to his friends as the work "of a young artist just entering on his eighty-third year." His life drew to a tranquil close, and the end came at Heathfield on Aug. 19, 1819. He was buried in the parish church of Handsworth.

Watt was twice married—first in 1763 to his cousin Margaret Miller, who died ten years later. Of four children born of the marriage, two died in infancy; another was James (1769–1848), who succeeded his father in business; the fourth was a daughter. His second wife, Anne Macgregor, whom he married before settling in Birmingham in 1775, survived him; but her two children, Gregory and a daughter, died young.

One of Watt's minor inventions was the press, patented in 1780, for copying manuscript by using a glutinous ink and pressing the written page against a moistened sheet of thin paper.

In the domain of pure science Watt claims recognition as a discoverer of the composition of water. Writing to Joseph Priestley in April 1783, with reference to some of Priestley's experiments, he suggests the theory that "water is composed of dephlogisticated air and phlogiston deprived of part of their latent or elementary heat." Watt's views were communicated to the Royal Society in 1783, Cavendish's experiments in 1784, and both are printed in the same volume of the *Philosophical Transactions*.

He was a man of warm friendships, and has numerous letters. They are full of insight: his own achievements are told with modesty and dry humour. In his old age Watt is described as a man stored with knowledge, full of anecdote, familiar with modern languages and a great talker. Scott so writes of him.

Muirhead, *Origin and Progress of the Mechanical Inventions of James Watt* (3 vols., 1854); Muirhead, *Life of Watt* (1858); Smiles, *Lives of Boulton and Watt;* Williamson, *Memorials of the Lineage, etc., of James Watt,* published by the Watt Club (Greenock, 1856); *Correspondence of the late James Watt on his Discovery of the Theory of the Composition of Water,* edited by Muirhead (1846); Cowper "On the Inventions of James Watt and his Models preserved at Handsworth and South Kensington," *Proc. Inst. Mech. Eng.* (1883); Robison, *Mechanical Philosophy,* vol. ii. (1822).

WATTEAU, ANTOINE (1684–1721), French painter, was born in Valenciennes, of humble Flemish origin. At fourteen he was placed with Gérin, a mediocre Valenciennes painter. But he learnt more from Ostade's and Teniers's paintings in his native town. His earliest works suggest this influence. Gérin died in 1702, and Watteau, almost penniless, went to Paris, where he joined the scene-painter Métayer. Things went badly with his master, and Watteau, broken in health, worked in a factory where devotional pictures were turned out wholesale. Three francs a week and meagre food were his reward. Claude Gillot then took Watteau as assistant, but the young man soon excelled his master, whose jealousy led to a quarrel. Watteau and his pupil, Lancret, entered about 1708 the studio of Claude Audran, decorative painter and keeper of the collections at the Luxembourg. His *chinoiseries* and *singeries* date probably from this period.

Watteau painted at this time "The Departing Regiment," the first picture in his second and more personal manner, in which the touch reveals the influence of Rubens's technique, and the first of a long series of camp pictures. He found a purchaser for the picture, at the modest price of 60 livres, in Sirois, the father-in-law of his later friend and patron Gersaint, and was thus enabled to return to Valenciennes. There he painted a number of small camp-pieces, two of which are at the Hermitage in Leningrad.

After a short sojourn at Valenciennes, he returned to Paris, where he lived with Sirois. He obtained the second prize in the Prix de Rome competition (1709). Watteau was made an associate of the Academy in 1712, and a full member in 1717, on the completion of his diploma picture, "The Embarkment for Cythera," now at the Louvre.

Watteau now went to live with Crozat, the greatest private art collector of his time, for whom he painted a set of four decorative panels of "The Seasons." He lived for six months with his friend Gersaint, for whom he painted in eight mornings a wonderful signboard depicting the interior of an art dealer's shop. His health made it imperative for him to live in the country, and in 1721 he took up his abode with M. le Fèvre at Nogent. He continued working with feverish haste. Among his last paintings were a "Crucifixion" for the curé of Nogent, and a portrait of the famous Venetian pastellist Rosalba Carriera, who at the same time painted her portrait of Watteau. His restlessness increased with the progress of tubercular disease; and on the 18th of July 1721 he died in Gersaint's arms.

Watteau, though Flemish, was more French than his French contemporaries. He led a revolt against the pompous classicism of the Louis XIV. period and combined a poet's imagination with a power of seizing reality. In his art can be found the germs of impressionism. Later theories of light and its effect upon the objects in nature are foreshadowed by Watteau's *fêtes champêtres*. He is the initiator of the Louis XV. period, but his paintings are usually free from the licentiousness of Lancret and Pater, and Boucher and Fragonard. Watteau's art was highly esteemed by such fine judges as Sirois, Gersaint, the comte de Caylus, and M. de Julienne, the last of whom collected paintings and sketches, and published in 1735 the *Abrégé de la vie de Watteau,* an introduction to the four volumes of engravings after Watteau by Cochin, Thomassin, Le Bas, Liotard and others. Until 1875, when Edmond de Goncourt published his *Catalogue raisonné* of Watteau's works, also discovering Caylus's discourse on Watteau delivered at the Academy in 1748, prices of Watteau's paintings rarely exceeded £100. Then the reaction set in, and in 1891 the "Occupation according to Age" realized 5,200 guineas at Christie's, and "Perfect Harmony" 3,500 guineas. At the Bourgeois sale at Cologne in 1904 "The Village Bride" fetched £5,000.

The finest collection of Watteau's works was in the possession

of the German emperor, who owned as many as thirteen, all of the best period, and mostly from M. de Julienne's collection. At the Kaiser Friedrich museum in Berlin are two scenes from the Italian and French comedy and a *fête champêtre*. In the Wallace Collection are nine of his paintings, among them "Rustic Amusements," "The Return from the Chase," "Gilles and his Family," "The Music Party," "A Lady at her Toilet" and "Harlequin and Columbine." The Louvre owns, besides the diploma picture, the "Antiope," "The Assemblage in the Park," "Autumn," "Indifference," "La Finette," "Gilles," "A Reunion" and "The False Step," as well as thirty-one original drawings. Other paintings of importance are at the Dresden, Glasgow, Edinburgh, St. Petersburg and Vienna galleries; and a number of drawings are to be found at the British Museum and the Albertina in Vienna. Of the few portraits known to have been painted by Watteau, one is in the collection of the late M. Groult in Paris.

BIBLIOGRAPHY.—Since the resuscitation of Watteau's fame by the de Goncourts, an extensive literature has grown around his life and work. The basis for all later research is furnished by Caylus's somewhat academic *Life*, Gersaint's *Catalogue raisonné* (Paris, 1744), and Julienne's *Abrégé*. For Watteau's childhood, the most trustworthy information will be found in Cellier's *Watteau, son enfance, ses contemporains* (Valenciennes, 1867). Of the greatest importance is the *Catalogue raisonné de l'oeuvre de Watteau*, by E. de Goncourt (1875), and the essay on Watteau by the brothers de Goncourt in *L'Art du XVIIIe siècle*. *See* also monographs by P. Mantz (Paris, 1892), by P. Dargenty (1891), by G. Séailles (1892), by Claude Phillips (1895), by Camille Mauclair (1905, and 1920), and A. M. Hind, *Watteau, Boucher and the French Engravers* (1911).

WATTERSON, HENRY (1840–1921), American journalist, was born in Washington (D.C.), Feb. 16, 1840. His father, Harvey McGee Watterson, who succeeded James K. Polk as a Democratic representative in Congress, was a journalist and lawyer. The son as a youth had literary ambitions, and turned to journalism, acting for a short time as music critic on the New York *Times*, serving on the Washington daily *States*, etc. During the Civil War he was attached to the staffs of Generals Forrest, Polk, and Hood; was chief of scouts in the Johnston-Sherman campaign, and edited the *Rebel* in Chattanooga. After further newspaper work and the first of many trips abroad he became editor of the *Journal* at Louisville (Ky.). In 1868, with W. N. Haldeman, he founded and became editor of the Louisville *Courier-Journal*, a consolidation of the *Courier*, the *Democrat*, and the *Journal*. Haldeman and Watterson adopted a policy of business integrity and interest in the public service which soon made the *Courier-Journal* one of the most influential of southern newspapers. It had its unpopular days, however, in such times as the Reconstruction period, when it stood for conciliation between the two sections, and during the Free Silver and Greenback agitations when it advocated a sound currency. Watterson was Democratic representative in Congress for a short term (1876–77). In general he sought no office for himself. In Aug. 1918 he became "editor-emeritus." In April 1919 he resigned from the paper because of its support of the League of Nations. He died at Jacksonville (Fla.), Dec. 22, 1921. He wrote *History of the Spanish American War* (1898), *The Compromises of Life and Other Lectures and Addresses* (1903), and *"Marse Henry"; an Autobiography* (1919). Some of his *Editorials* were collected by Arthur Kroch in 1923.

See "Henry Watterson and His 'Courier-Journal'" in O. G. Villard's *Some Newspapers and Newspaper-Men* (1926).

WATT-HOUR METERS, measure the total energy used in electric circuits ($\int ecdt$). The Board of Trade unit of electrical energy is the kilowatt hour (amperes × volts × hours ÷ 1,000). The energy taken from D.C. circuits at constant voltage can be measured by ampere-hour meters which may be of the electrolytic or dynamometer type; but in A.C. circuits the power factor has to be allowed for, and dynamometer or induction wattmeters provided with a time integrating device must be employed. (*See* INSTRUMENTS, ELECTRICAL.)

WATTIGNIES, a village of France 5½ m. S.S.E. of Maubeuge, the scene of a battle in the French Revolutionary Wars (*q.v.*), fought on Oct. 15–16, 1793. The Allied Army, chiefly Austrians, under Coburg, was besieging Maubeuge, and the Revolutionary Army, preparing to relieve it, gathered behind Avesnes.

Even without the Maubeuge garrison Jourdan had a two-to-one superiority. The French however were still the undisciplined enthusiasts of Hondschoote. Their left attack progressed so long as it could use "dead ground" in the valleys, but when the Republicans reached the gentler slopes above, the volleys of the Austrian regulars crushed their swarms, and the Austrian cavalry, striking them in flank, rode over them. The centre attack, ordered by Carnot on the assumption that all was well on the flanks, was premature; like the left, it progressed while the slopes were sharp, but when the Republicans arrived on the crest they found a gentle reverse slope before them, at the foot of which were Coburg's best troops. Again the disciplined volleys and a well-timed cavalry charge swept back the assailants. The French right reached, but could not hold, Wattignies. At last, after a long fight, Carnot and Jourdan won the plateau, and Coburg drew off. His losses were 2,500 out of 23,000, Jourdan's 3,000 out of 43,000.

WATTLE AND DAUB or **DAB,** a term in architecture applied to a wall made with upright stakes with withes twisted between them and then plastered over. It is probably one of the oldest systems of construction. The Egyptians employed the stems of maize for the upright stakes; these were secured together with withes and covered over with mud, the upper portions of the maize stems being left uncut at the top, to increase the height. These uncut tops were bent out by the weight of the mud roof, and were probably the origin of the later cavetto cornice, the torus moulding below representing the heavier coil of withes at the top of the wall. Vitruvius (ii. 8) refers to wattle and daub; in the middle ages it was employed as a framework for clay chimneys, and for the filling in of half-timber.

WATTMETER, an instrument for the measurement of electric power or the rate of supply of electric energy to any circuit. For direct current (D.C.) circuits the power supplied is given in *watts* by multiplying together the current (in amperes) and the voltage; but, when alternating currents (A.C.) are used with inductive circuits, this product has itself to be multiplied by the power factor—a quantity which depends on the phase relationship of the current and the electromotive force. Wattmeters measuring this combined product are of three types: (a) electrostatic—used only in standardising laboratories, (b) dynamometer instruments based on the principle of the Siemens electrodynamometer, and (c) induction instruments. Types (a) and (b) may be used for both A.C. and D.C. supplies, but type (c) can be used only for A.C. circuits.

WATTS, GEORGE FREDERIC (1817–1904), English painter and sculptor, was born in London on Feb. 23, 1817. While hardly more than a boy he entered the Royal Academy schools; but his attendance was short-lived, and his further art education was confined to personal experiment and endeavour, guided and corrected by a constant appeal to the standard of ancient Greek sculpture. There are portraits of himself, painted in 1834; of Mr. James Weale, about 1835; of his father, "Little Miss Hopkins," and Mr. Richard Jarvis, painted in 1836; and in 1837 he exhibited at the Academy "The Wounded Heron" and two portraits. His first exhibited figure-subject, "Cavaliers," was shown at the Academy in 1839, and was followed in 1840 by "Isabella e Lorenzo," in 1841 by "How should I your true love know?" and in 1842 by a scene from *Cymbeline* and a portrait of Mrs. Ionides. At the exhibition in Westminster Hall held in 1843 in connection with the decoration of the new Houses of Parliament, Watts secured a prize of £300 for a design of "Caractacus led in triumph through the streets of Rome." This enabled him to visit Italy in 1844, and he remained there during the greater portion of the three following years, for the most part in Florence, where he enjoyed the patronage and personal friendship of Lord Holland, the British ambassador. For him he painted a portrait of Lady Holland, exhibited in 1848, and in his Villa Careggi, near the city, a fresco, after making some experimental studies in that medium, fragments of which are now in the Victoria and Albert Museum. Encouraged by Lord Holland the artist in 1847 took part in another competition, the third organized by the Royal Commissioners, this time for works in oil. Watts's car-

toon "Alfred inciting his subjects to prevent the landing of the Danes, or the first naval victory of the English," not only gained a first-class prize of £500 at the exhibition in Westminster Hall, but was purchased by the government, and now hangs in one of the committee rooms of the House of Commons. It led, moreover, to a commission for the fresco of "St. George overcomes the Dragon" (1848–1853), which forms part of the decorations of the Hall of the Poets in the Houses of Parliament. His offer to paint, gratuitously, a series of frescoes illustrating "The Progress of the Cosmos" for the interior of the great hall in Euston station was refused. A similar proposition made shortly afterwards to the Benchers of Lincoln's Inn resulted in Watts's execution of the fresco, "Justice: a Hemicycle of Lawgivers," in the hall.

While this large undertaking was in progress, Watts was working steadily at pictures and portraits. In 1849 the first two of his great allegorical compositions were exhibited—"Life's Illusions," an elaborate presentment of the vanity of human desires, and "The people that sat in darkness," turning eagerly towards the growing dawn. In 1850 he presented to the city of Manchester, in memory of the philanthropist Thomas Wright, the picture of "The Good Samaritan." In 1856 Watts paid a visit to Lord Holland at Paris, where he was then ambassador, and through him made the acquaintance and painted the portraits of Thiers, Prince Jerome Bonaparte and other famous Frenchmen.

In 1867 Watts was elected A.R.A., in the course of the same year, R.A. Thenceforward he exhibited each year, with a few exceptions, at the Academy, even after his retirement in 1896, and he was also a frequent contributor to the Grosvenor Gallery, and subsequently to the New Gallery, at which a special exhibition of his works was held in the winter of 1896–1897. With intervals of travel, he spent the greater part of his life in work at his studio, either at Little Holland House, Kensington, where he settled in 1859, or in the country at Limnerslease, Compton, Surrey. Apart from his art, his life was happily uneventful, the sole facts necessary to record being his marriage in 1886 with Miss Mary Fraser-Tytler, an early union with Miss Ellen Terry having been dissolved many years before; his twice receiving (1885 and 1894), but respectfully declining, the offer of a baronetcy; and his inclusion in June 1902 in the newly founded Order of Merit. He died on July 1, 1904.

Portraits.—Many of Watts's distinguished contemporaries sat to him for portraits. Among politicians are the duke of Devonshire (1883), Lords Salisbury (1884), Sherbrooke (1882), Campbell (1882), Cowper (1877), Ripon (1896), Dufferin (1897) and Shaftesbury (1882), Mr. Gerald Balfour (1899), and Mr. John Burns (1897); poets—Tennyson, Swinburne (1884), Browning (1875), Matthew Arnold (1881), Rossetti (1865, and subsequent replica) and William Morris (1870); artists—himself (1864, 1880, and eleven others), Lord Leighton (1871 and 1881), Calderon (1872), Prinsep (1872), Burne-Jones (1870), Millais (1871), Walter Crane (1891), and Alfred Gilbert (1896); literature is represented by John Stuart Mill (exhibited 1874), Carlyle (1869), George Meredith (1893), Max Müller (1895) and Mr. Lecky (1878); music, by Sir Charles Hallé; while among others who have won fame in diverse paths are Lords Napier (1886) and Roberts (1899), General Baden-Powell (1902), Garibaldi, Sir Richard Burton (1882), Cardinal Manning (1882), Dr. Martineau (1874), Sir Andrew Clark (1894), George Peabody, Mr. Passmore Edwards, Claude Montefiore (1894). Even more significant from an artistic point of view is the great collection of symbolical pictures in the Tate Gallery.

Subject Pictures.—Watts never wearies of emphasizing the reality of the power of Love, the fallacy underlying the fear of Death. To the early masters Death was a bare and ghastly skeleton, above all things to be shunned; to Watts it is a bringer of rest and peace, not to be rashly sought but to be welcomed when the inevitable hours shall strike. *Sic transit* (1892) shows a corpse, with the famous inscription, "What I spent I had; what I saved I lost; what I gave I have." So with the "Court of Death" in the Tate Gallery. Also we have "Love and Life," exhibited in 1885, a replica of an earlier picture in the Metropolitan Museum, New York, and of another version in the Luxembourg, Paris. "Love and Death," one version of which was exhibited in 1877 and others in 1896, and later; and "Love Triumphant" (1898).

Sculpture.—Founded admittedly on the Grecian monuments, there is a sculpturesque rather than pictorial quality in most of the paintings by Watts. To him, sculpture was thus natural. He visited the studio of Behnes, but was not his pupil. Among his works are a bust of "Clytie" (1868), monuments to the marquis of Lothian, Bishop Lonsdale and Lord Tennyson, a large bronze equestrian statue of "Hugo Lupus" at Eaton Hall (1884), and a colossal one of a man on horseback, emblematical of "Physical Energy," originally intended for a place on the Embankment, but destined to stand among the Matoppo Hills as an enduring evidence of the artist's admiration for Cecil Rhodes; a replica is now placed in Kensington Gardens. Much of his time and attention was given to the promotion of the Home Arts and Industries Association; he assisted Mrs. Watts with both money and advice in the founding of an art pottery at Compton, and in the building at the same place of a highly decorated mortuary chapel, carried out almost entirely by local labour; and it was entirely due to his initiative that the erection in Postmen's Park, Aldersgate Street, London, of memorial tablets to the unsung heroes of everyday life was begun.

Chesterton (1905); Mrs. Barrington (1905); and a *Life* in 3 vols., by his widow (1912).

WATTS, ISAAC (1674–1748), English theologian and hymn writer, son of a clothier, was born at Southampton on July 17, 1674. The father, who afterwards had a boarding-school at Southampton, also wrote poetry, and a number of his pieces were included by mistake in vol. i. of the son's *Posthumous Works*. Isaac Watts studied at the Nonconformist academy, Stoke Newington, London. On leaving the academy he spent over two years at home, and began to write his hymns. In the autumn of 1696 he became tutor in the family of Sir John Hartopp at Stoke Newington, where he probably prepared the materials of his two educational works—*Logick, or the Right Use of Reason in the Enquiry after Truth* (1725), and *The Knowledge of the Heavens and the Earth made easy, or the First Principles of Geography and Astronomy Explained* (1726). In his twenty-fourth year Watts became assistant pastor of the Independent congregation in Mark Lane, London, and two years later he succeeded as sole pastor. In 1712 he went to live with Sir Thomas Abney of Abney Park.

Watts preached only occasionally, devoting his leisure chiefly to the writing of hymns (*see* HYMNS), the preparation of his sermons for publication, and the composition of theological work. In 1706 appeared his *Horae Lyricae*, of which an edition with memoir by Robert Southey forms vol. ix. of *Sacred Classics* (1834); in 1707 a volume of *Hymns;* in 1719 *The Psalms of David;* and in 1720 *Divine and Moral Songs for Children.* His Psalms are free paraphrases, rather than metrical versions, and some of them ("O God, our help in ages past," for instance) are amongst the most famous hymns in the language. Isaac Watts died on Nov. 25, 1748, and was buried at Bunhill Fields.

Among the theological treatises of Watts, which are far from conventional orthodoxy, are: *Doctrine of the Trinity* (1722); *Essay on the Freedom of the Will* (1732); and *Useful and Important Questions concerning Jesus, the Son of God* (1746). He was also the author of a variety of miscellaneous treatises. His *Posthumous Works* appeared in 1773, and a further instalment of them in 1779. *The Works of . . . Isaac Watts* (6 vols.), edited by Dr. Jennings and Dr. Doddridge, with a memoir compiled by G. Burder, appeared in 1810–1811. His poetical works were included in Johnson's *English Poets*, where they were accompanied by a *Life*, and they appear in subsequent similar collections. *See* also Thomas Milner, *The Life, Times and Correspondence of Isaac Watts* (1834); and T. Wright, *Isaac Watts and Contemporary Hymn Writers* (1914). His *Letters 1730–1747* are printed in the *Proceedings* of the Massachusetts Hist. Soc., Series 2, vols. ix. and xii. (1895–99).

WATTS, SIR PHILIP (1846–1926), K.C.B. (1905), British naval architect, was born in Kent on May 30, 1846, of a family who had been shipbuilders for many generations, and was trained at the Royal school of naval architecture at Portsmouth. He entered the admiralty as a draughtsman, being promoted to the grade of constructor in 1883. After almost a year (Nov. 1884–Oct. 1885) on the staff at Chatham dockyard, Watts left the admiralty and became (1885–1901) director of the war shipping department of Armstrong, Withworth and Co., at Elswick. During this period he designed and built, in addition to British ships, many ships for foreign navies: Argentina, Norway, Portugal, etc. He also had a large share in the modern Japanese navy. On Feb. 1, 1902 he was appointed director of naval construction at the admiralty, and in this position was responsible for naval construction during the decade preceding the World War. The designs committee, set up at the instigation of Lord Fisher, who became first sea lord on Oct. 21 1904, started the production of ships of the Dreadnought battleship and Indomitable battle-cruiser type. The responsibility of Sir Philip Watts was hardly lessened. He designed many classes of battleships, and all the battle-cruisers in the navy when the World War broke out were of his design. During his term of office his department took over from private firms the designing of submarines. In 1912 he became adviser to the admiralty on naval construction. In 1916 he returned as director of his firm at Elswick. He was elected F.R.S. in 1900. He died in London on March 15, 1926.

WATTS, WILLIAM (1782– ?), inventor, a native of Bristol found by experiment that drops of molten lead falling into water from a great height hardened into spherical form. He thus invented round shot, shot having been up to that time oblong in shape. He procured a patent, and "Watts Patent Shot" was patronized by George III., who presented him with plates of King Lung china, now on exhibition in the old shot tower, built by Watts, on Redcliffe Hill, Bristol.

WATTS-DUNTON, WALTER THEODORE (1832–1914), English man of letters, was born at St. Ives, Huntingdon, on Oct. 12, 1832, his family surname being Watts, to which he added in 1897 his mother's name of Dunton. He was originally educated as a naturalist, and saw much of the East Anglian gypsies, of whose superstitions and folk-lore he made careful study. He qualified as a solicitor and went to London, where he practised for some years, and contributed regularly to the *Examiner* and the *Athenaeum*. His article on "Poetry" in the ninth edition of the *Ency. Brit.* (vol. xix., 1885) was the principal expression of his views on the subject. Watts-Dunton was in later years Rossetti's most intimate friend. He was the bosom friend of Swinburne (*q.v.*), who shared his home for nearly thirty years before he died in 1909. In 1897 he published a volume of poems under his own name, *The Coming of Love*. His prose romance *Aylwin* (1898) attained immediate success, and ran through many editions in the course of a few months. Both *The Coming of Love* and *Aylwin* set forth, the one in poetry, the other in prose, the romantic and passionate associations of Romany life, and maintain the traditions of Borrow, whom Watts-Dunton had known well in his own early days. He edited George Borrow's *Lavengro* (1893) and *The Romany Rye* (1900); his *Studies of Shakespeare* appeared in 1910; in 1903 he published *The Renascence of Wonder*, a treatise on the romantic movement, as a preface to the third volume of Chambers's *Encyclopaedia of English Literature*, and in 1916 this, with his *Encyclopædia Britannica* article—both enlarged—was republished in book form as *Poetry and the Renascence of Wonder*. He died at Putney on June 6, 1914.

See T. St. E. Hake and A. C. Rickett, *The Life and Letters of Theodore Watts-Dunton* (2 vols. 1916).

WAUGH, BENJAMIN (1839–1908), English social reformer, was born at Settle, Yorkshire, on Feb. 20, 1839. He passed some years in business, but in 1865 entered the congregational ministry. Settling at Greenwich he devoted himself especially to children. He served on the London School Board from 1870 to 1876. In 1884 he founded the London society for the prevention of cruelty to children, of which he was honorary secretary. It was owing to information obtained by him that the Criminal Law Amendment Act of 1885 was passed. He secured a clause giving magistrates power to take the evidence of children too young to understand the nature of an oath. In 1889 he saw his society (of which he had been made director the same year) justified by the act for the prevention of cruelty to children, the first stepping-stone to the act of 1908. (*See* CHILDREN—PROTECTIVE LAWS.)

In 1895 a charter of incorporation was conferred on the society, but in 1897 its administration was attacked. An inquiry was demanded by Waugh, and the commission which included Lord Herschell, vindicated the society and its director. Waugh had given up pastoral work in 1887, and he retained his post as director until 1905. He died at Westcliff, near Southend, Essex, on March 11, 1908. Waugh edited the *Sunday Magazine* from 1874 to 1896. His *The Gaol Cradle, who rocks it?* (1873) was a plea for the abolition of juvenile imprisonment.

See R. Waugh, *Life of B. Waugh* with introd. by Lord Alverstone (1913).

WAUKEGAN, a city of Illinois, U.S.A., on Lake Michigan, 40 m. N. by W. of Chicago. Population 19,226 in 1920 (25% foreign-born white); estimated locally at 31,000 in 1928. The city lies on a plateau 100 ft. above the lake. The streets are intersected by beautiful wooded ravines, which are bridged for traffic and utilized for parks. There is a good harbour, with coal docks. The site of Waukegan is designated on a map in a history of the United States published in London in 1795 as Little Fort, and the first settlers (1835) found decaying timbers of an old stockade. The village became the county seat in 1841, and in 1849 was incorporated, changing its name from Little Fort to the Pottawattomie equivalent. In 1859 it was chartered as a city. It was a post on the old Green Bay trail, built up a thriving lake traffic after 1845, and was reached by the Chicago and North Western railway in 1855.

WAUKESHA, a city of Wisconsin, U.S.A., 16 m. W. of Milwaukee, on the Little Fox river. Population (1920) 12,558 (85% native white); 17,600 in 1928 (city census). There are mineral springs which were first exploited in 1868 and have led to the establishment of institutions of healing. The waters (White Rock, Bethesda, and others) are shipped to all parts of America and to Europe. Waukesha is the seat of Carroll college (Presbyterian; 1846), the State Industrial school for boys (1860), and a U.S. Veterans' hospital. It is a shipping point for pure-bred Holstein and Guernsey cattle. It was settled in 1836, was named Prairieville in 1839, incorporated as a village under its present name (supposed to mean "fox") in 1852 and in 1896 was chartered.

WAUPUN, a city of Wisconsin, U.S.A., 60 m. N.W. of Milwaukee. Pop. 4,440 in 1920; estimated locally at 5,500 in 1928. It is the seat of the State prison and of the Central State hospital for the insane. It was founded in 1838 and incorporated in 1857. The name means "early dawn."

WAUSAU, a city of Wisconsin, U.S.A. Pop. (1920) 18,661 (82% native white); estimated locally at over 23,000 in 1928. The German element predominates Wausau is in the red-clover belt of the State, where dairying is the principal occupation. Honey, corn, small grains and potatoes are also products. The city occupies 6 sq.m., extending back to high bluffs on either side of the river. On the western edge, in an 80 ac. park of virgin pine, are the tourist camp and the buildings of the Wisconsin Valley Fair and Exposition; and 5 m. W. is the county tuberculosis sanatorium. Rib hill (1,950 ft.), the highest point in the State, is 5 m. south-west. Wausau has ample hydro-electric power, generated in local plants. Granite of several colours is quarried and there are silver-fox farms. A logging camp was established here about 1838, and in 1840 a saw-mill was built. The village was incorporated in 1858, and was chartered as a city in 1880. The name is an Indian word meaning "far away."

WAUTERS, EMILE (1848–), Belgian painter, was born in Brussels in 1848. He studied under Portaels and Gérôme. In 1868 he produced a striking work, "The Battle of Hastings: the Finding of the body of Harold by Edith." A journey to Italy in no wise affected his individuality, which was as marked in his "The Great Nave of St. Mark's" (purchased by the king of the Belgians) as in his earlier work. As his youth disqualified him

for the medal of the Brussels Salon, he was sent, by way of compensation, as artist-delegate to Suez for the opening of the canal. In 1870 Wauters exhibited his great historical picture of "Mary of Burgundy entreating the Sheriffs of Ghent to pardon the Councillors Hugonet and Humbercourt" (Liége museum) which created a great sensation. Even more celebrated was the "Madness of Hugo van der Goes" (1872, Brussels museum), a picture which gained for him the grand medal at the Salon and led to the commission for two large works decorating the Lions' stair case of the Hôtel de Ville. His vast panorama, "Cairo and the Banks of the Nile" (1881), 380 ft. by 49 ft., was exhibited with extraordinary success in Brussels, Munich and The Hague. Wauters also painted some admirable portraits, sometimes using pastel as a medium.

See M. H. Spielmann, *Magazine of Art* (1887); A. J. Wauters, *Magazine of Art* (1894); Joseph Anderson, *Pall Mall Magazine* (1896); G. Seraé ("Wauters as a Painter of Architecture") *Architectural Record* (1901).

WAUWATOSA, a city of Wisconsin, U.S.A. Pop. 5,818 in 1920 (84% native white) and was estimated locally at 18,300 in 1928. It is a suburb of Milwaukee, and is the seat of the Evangelical Lutheran Theological seminary. The city was founded in 1847 and incorporated in 1892. The name is a modification of an Indian word meaning "firefly."

WAVE ANTENNA, a horizontal radio aerial, the physical length of which is of the same order of magnitude as that of the signaling waves to be received, and which is so used as to be strongly directional.

WAVE LENGTH, in radio, the distance traveled in one period or cycle by a periodic disturbance. The distance between corresponding phases of two consecutive waves of a wave train. The quotient of velocity by frequency. For a discussion of theory *see* PHYSICS, ARTICLES ON; ELECTRIC WAVES; for wave lengths in broadcasting and wireless *see* WIRELESS TELEGRAPHY, *Communication by Wireless.*

WAVELLITE, a mineral consisting of hydrated aluminium phosphate, $Al_3(OH)_3(PO_4)_2+4\frac{1}{2}H_2O$, crystallizing in the orthorhombic system. Distinct crystals are of rare occurrence, the mineral usually taking the form of hemispherical or globular aggregates with an internal radiated structure. It is translucent and varies in colour from grey or white to greenish, yellowish, etc. The hardness is 3·5, and specific gravity 2·32. It was first found, at the end of the 18th century, by Dr. W. Wavell near Barnstaple, Devon, where it lines crevices in a black slaty rock.

WAVERLY, a village of Tioga county, New York, U.S.A. Pop. (1925) 5,578 (State census). The Pennsylvania borough of South Waverly (pop. 1,251 in 1920) is separated from Waverly only by the State line; and the neighbouring boroughs of Sayre (*q.v.*) and Athens (8,078 and 4,384 respectively in 1920) are also part of the same community. It was named after Scott's novels.

WAVE SCROLL, in architecture and the decorative arts, a continuous line which starts as a spiral, then suddenly reverses its curvature and by a long, concave sweep rises to form the beginning of the next spiral of the series.

WAVES OF THE SEA. It may easily be observed that when smooth water is struck by wind the surface is immediately covered by a ribbed pattern of transverse inequalities about one inch from crest to crest travelling very slowly in the direction of the wind, and however long the breeze continue there is no increase of their size or speed immediately adjacent to the shore off which it blows. To leeward, however, there is an increase in the height and speed of the ridges and the distance between their crests. This distance is called the wave-length, the distance for which an individual ridge can be traced, the crest-length. In the deep waters of the open ocean the height, speed and wave-length is limited only by the velocity of the wind, but even the largest lakes have not sufficient room for full growth. Our knowledge of the height of waves at sea is mostly obtained by the primitive method of finding how high above the ship's water-line the observer must stand so that the passing crests shall top the horizon.

During a voyage from Liverpool to Boston, U.S.A., by the "Ivernia" the wind on Dec. 7, 1900, was a strong gale, number 9 on Beaufort's scale of force, reckoned as having an average speed of 50 statute or land miles per hour. The writer observed that the waves, which met the ship at a considerable angle, usually topped the horizon when the view-point was 30 feet above the ship's water-line and that a position 43 feet above that line had to be taken up in order to be on a level with the tops of the largest waves.

On Feb. 9, 1907, bound from New York for Southampton there was only a moderate breeze, but the "Minnehaha" rolled heavily in a huge swell from the north-west. The origin of the swell was revealed to us by a message from the "Cedric" to the north, which reported a strong north-west gale. The actual level of the trough of the waves was determined by means of a heavy rope let down over the ship's side, and the true height of the swells, which were of nearly uniform size, was found to be slightly more than 41 feet. Of the height of waves in a whole gale, Beaufort's force 10, average wind velocity 59 miles per hour, the writer has obtained estimates from master mariners, with the details of accompanying conditions which are necessary to give precise meaning to these statements. The records prove a height of nearly 50 feet.

Formula and Practice.—On Dec. 29, 1922, in the course of a prolonged storm in the North Atlantic, the wind reached and maintained for a considerable time the maximum or hurricane velocity, computed at 75 miles an hour and upwards. The "Majestic," hove-to and rode easily among the waves which were of remarkable regularity and phenomenal size. Under these favourable conditions observations were recorded and it was found that the height of the waves from trough to crest exceeded 70 feet.

It is clear that the height of the waves finally produced in the open ocean is in direct, simple proportion to the velocity of the wind. The larger waves occurring at short intervals which chiefly attract attention have about eight feet of height, reckoning from trough to crest, for each 10 miles-an-hour velocity of wind, but their apparent height is less when the ship is borne upon two waves.

In order to determine the height of the waves we must place ourselves so as to be on a level with the crests. In judging from this level the wave-length or distance between crests, dimensions have been obtained far below that which had been calculated by the usual mathematical formula from the period of the waves, the interval of time between the arrival of crests, and the question therefore arose whether the eye had been deceived or the calculation applied to conditions not contemplated in the mathematical theory. The answer was obtained by the writer on Dec. 21, 1911, when the "Egypt" was hove-to in the Bay of Biscay. The waves rose rather more than 30 feet above the ship's water-line, and from the promenade deck, which gave an eye-height of 27 feet, the wave-length appeared to be scarcely equal to the length of the vessel whereas the period indicated that it should be greater. Ascending to the navigating bridge where the view-point was 54 feet above water-line the whole length of the ship was seen to lie well within the interval between wave-crests, and the wave-length as judged from this position agreed with the period. The apparent wave-length from this elevated position was also in mathematical agreement with the speed of the waves which was determined from the time which they took to run the length of the stationary ship. That the eye is so greatly deceived in judging wave-length from near the level of the crests is due to the very slight convexity of the ridges, and the apparent brow of both the receding and advancing wave being much nearer than the true summit.

On the occasion above referred to when the ship was hove-to the speed of the waves (determined in unusually favourable conditions) was about forty-seven miles an hour when the velocity of wind, calculated from the recorded number on Beaufort's scale, was 52 miles an hour. It appears therefore that only a 5 mile-an-hour wind was blowing over the wave-crests, just enough to turn a weather-cock or to make leaves rustle. Thus the wind, which had blown all night with great violence in the direction of the heavy swell already running in the Bay, had increased its speed so much that there was no longer any buffeting, wave and wind being an harmonious procession.

Observers are agreed that the waves finally formed in a great storm of long continuance are not so steep as those in a moderate gale. According to mathematical theory, if the speed of the waves be doubled their length is increased four-fold, and so on, the wave-length increasing as the square of the speed. But the height only increases in simple proportion with that velocity, so that the steepness of the final waves would diminish in exact proportion to the violence of the storm.

Final Dimensions.—In pursuit of the enquiry into the final dimensions of waves produced by wind by the writer, observations were made during a voyage from Southampton to Trinidad and back in 1912 upon the period of the waves. The interval of time between the arrival of successive wave-crests at a fixed mark is necessarily the same as the time of subsidence and upheaval of a wave-crest. It was found during the course of the voyage that a single observer could easily determine the period, and hence by calculation the speed, of the waves by timing with a stop-watch the up-and-down oscillation of patches of foam, and that the period of the swell then running could also be determined by the same means. Later observations of movement of foam patches with and against wind made at the turn of current on a tidal river proved that the drift of the foam was too slow to invalidate the results. On a subsequent voyage from Trinidad to Southampton, with a fresh breeze most of the way, a cup-and-ball anemometer was mounted on the navigating bridge, and from the reading of the instrument, combined with observation of the direction of the wind relative to the course of the ship, the speed of the wind which drove the waves was measured.

The daily record of results showed no definite relation between speed of wind and wave, although in the trade-wind belt the weather conditions were steady. Fortunately, however, the direction and speed of the ocean swell, the longer undulation produced by former winds or derived from a distance, had also been recorded. The daily observations having been grouped according to the direction of the swell, it was found that when this was the same as the direction of the waves proper, the speed of the waves was nearly as great as that of the wind, which blew across the ridges as a "light air," the force 1 of Beaufort's scale, sufficient to impart a drift to the smoke from a chimney but not strong enough to turn a wind vane. When, however, the swell met the waves or crossed their direction, the speed of the wave was much less than that of the wind. The height of the waves was also greatly reduced by these conditions, an observation which suggests that the rapidity with which wind raises waves on lakes and enclosed seas is connected with absence of conflicting swell. The most rapid increase of wave-height, however, occurs on the somewhat rare occasion when a rising wind on the open ocean blows in the same direction as that in which the swell is running and with a speed greater than that of the swell. This was the condition which produced the large and regular waves observed in the Bay of Biscay on Dec. 21, 1911.

Squalls.—In a rising sea the tops of the waves are cut off and blown away in spray during the squalls of a few minutes' duration which punctuate the gale, but when the storm has continued for a long time the effect of a squall is to increase the height of the waves, and this action is especially noticeable when the storm is abating. Thus on December 22, 1906 on a voyage from Liverpool to Puerto Colombia, while still in the North Atlantic, with a heavy sea and a following wind having the force of a moderate gale, the writer judged that a violent squall lasting four minutes increased the height of the waves by about seven feet. As the squall travelled on, the rear of the group of higher waves could be seen travelling ahead, soon to pass out of sight. On the next day, Dec. 23, when the gale had dropped to a strong breeze, a squall of three minutes' duration increased the height of the waves by about six feet, and considerably increased their crest-length. Two minutes after the passing of the squall the ship was among waves of the average size, but a group of several great ridges could be seen ahead. On the following day, Dec. 24, the wind fell considerably and the waves were much lower. At about 5 P.M. a narrow band of black cloud stretching from the zenith to the horizon on either hand passed over the ship. Its transit, which occupied about five minutes, was attended by only a slight increase of wind but was nevertheless accompanied by a group of at least a dozen large waves among which the ship rolled heavily. Ten minutes after the passing of the cloud the ship was among waves of the same size as before.

If the viewpoint during these three days had been the cockpit of an aeroplane at a considerable height, with good conditions of visibility, the ribbed pattern of the sea would have been marked by stripes, owing to the recurrence of groups of higher and more regular ridges. If the speed of waves so formed be greater than the average they will outrun the others when the wind dies down and herald the approach of the main body by a slow-booming surf. Observations by the writer on the Dorset coast in the winter of 1898–99 when a succession of great storms occurred in the North Atlantic, point to the conclusion that a group of waves of greater speed as well as greater height is associated with each squall. On the afternoon of Dec. 29, 1898, in fine weather during off-shore wind, large breakers succeeded one another for three-quarters of an hour without interruption, one-hundred-and-thirty-nine in all. The average interval was 19 seconds, showing that their speed when in deep water was 66½ miles per hour.

The wave-length calculated from the period is 1,850 feet, so that while in deep water the length of the group from front to rear was 49 miles. This main body had been heralded a few hours earlier by the arrival of five groups of large breakers containing from four to seven members with an average interval of 20 seconds, corresponding to a speed in deep water of 69½ miles per hour. The interval elapsing between the first breaker of the first group and the last of the last group was 52 minutes, which is comparable with the 45-minute duration of the main body that followed in the afternoon. The time occupied by each group in discharging its breakers ranged from one minute to a little more than two minutes. The data indicate therefore that squalls of one to two minutes' duration occurring at about ten minute intervals had engendered groups of waves possessing greater speed which had outrun the main body and reached the shore some hours earlier.

The longest period of swell recorded during this stormy winter was on Feb. 1, 1899 when a group of twelve breakers arrived at intervals of 22½ seconds, corresponding to a speed in deep water of 78½ miles an hour. Anemometers at shore stations in Great Britain did not record a sustained velocity so great as this, 70 miles an hour maintained for two hours being the highest. On the other hand velocities much greater than 78½ miles per hour lasting for some seconds are occasionally recorded by anemometers on our shore stations, as much as 106½ miles per hour having been registered. Waves with a speed of 100 miles an hour would have a period of 28·6 seconds which is far greater than that of any North Atlantic swell recorded by the writer. A storm which lasts for hours is punctuated by squalls which last for minutes, so the squalls are punctuated by gusts which last for seconds at most, and it appears that the speed of the swiftest groups of waves approximates to the average speed of wind during the squall but does not approach that of its momentary gusts. Our habit of thinking of a squall as short-lived is due to the circumstance that we are not able to keep company with its progress. Individual squalls travelling from twenty to forty miles an hour have been traced by the recording instruments of meteorological stations during an unbroken march of a thousand miles.

Squall-action on Waves.—Let us now consider how many waves are simultaneously subject to the action of a squall. A squall which advances at 40 miles an hour (no matter what be the velocity of wind developed therein) and which passes over in three minutes, is two miles, 10,560 feet, from front to back, and this may be called its length of fetch upon the sea. The breakers which came in groups of four to seven on the morning of Dec. 29, 1898 had a period of twenty seconds and the length of the waves while in deep water was therefore 2,050 feet. A three-minute squall travelling at forty miles an hour would act upon five such waves simultaneously, and the waves, reacting on the air, would throw it into conformable undulations superposed upon eddies between the crests of the water waves. A three-

second gust during this squall would be only 176 feet from front to back and could therefore have no comparable effect upon the group of waves.

It has been pointed out that a single observer upon a vessel under way can readily and quickly determine the period of the waves by noting the time taken by a patch of foam in falling and rising. If a swift running, slow-heaving swell be present, its period of oscillation can also be determined from the foam spots, for the slower heave is easily watched, not, as might be expected, camouflaged by the shorter waves. The time of subsidence and upheaval in seconds multiplied by 3½ gives the velocity of the wave or swell in miles per hour. When nearing the northern limit of the trade-wind belt on a voyage from Barbados to Southampton, waves travelling 16 miles an hour were recorded by the writer in an easterly breeze of 19 miles an hour, together with a swell from a northerly quarter with a period of 13¼ seconds and consequently a speed of 46½ miles an hour, which must have been produced by a strong gale, the term for a sustained average wind-velocity of 50 miles an hour.

Much of the region in which the true hurricane or typhoon occurs is not ordinarily subject to long-period swells, and when such are observed it is desirable that seamen should have precise data for judging the force of wind which produced them, for if very great it is certainly associated with these whirling storms which are so disastrous to shipping. If the navigating officer will note the number of seconds occupied by the subsidence and upheaval of a patch of foam as it falls and rises with the swell and multiply the number by 3½ he will know at once that the product is only a few miles an hour less than the velocity of the wind which produced the swell, and will therefore be able to place the distant disturbance in its category in Beaufort's scale of force with greater precision than if he rely upon "sea sense" unaided by measurement.

In order to realise the process of wave transmission after the wind has dropped, let us picture the profile of a wave from one trough to the next following trough. The water between the first trough and the crest is rising, that between the crest and the next trough, falling The continual rise of front is the advance of the wave; in the subsiding back of the mound we see the action of the propelling agent, which is the force of gravity. The less the depth of water participating in the transmission, the slower will be the progress of the rising front, and for any given depth of water there is a limiting speed of transmission which can be calculated from the force of gravity. A strong gale in the North Atlantic produces waves more than 800 feet from crest to crest travelling 45 miles an hour, and after the wind drops the speed is maintained as long as the depth of water is comparable with the wave-length, but when the depth is reduced from 800 to 8 feet the speed is diminished to about one quarter, and the distance between crests reduced to 200 feet. Thus the league-long crests, widely separated, of the ocean swell travelling swiftly up the English Channel are bent back near the coasts of France and England, upon which rollers, ranged nearer to one another advance more slowly but reach the shore at intervals of time equal to the period of the swell.

When the depth of water below the troughs is comparable to the height of the waves from trough to crest we can no longer say that there is definite depth in which the wave as a whole is being transmitted, and in fact the rate of transmission is considerably greater at crest than trough. The ridges then cease to be symmetrical, become steep-fronted and cusped, and at last the cusp curls over in a scroll and falls.

Beaches.—At Eastbourne during the larger, or spring, tides near the times of new and full moon the difference of level between high and low water is about twenty feet. At high water on a calm day the sea is a few feet below the top of the bank of shingle. At low water the whole bank of shingle and an almost level stretch of sand beyond lies exposed. At high water on a rough day there is sufficient depth for large rollers to hold together until near the shore, so that a spectator on the beach can watch the process of steepening and curling over from close quarters. The relation of the depth of water in which a wave breaks to the height of the wave varies somewhat with the slope of shore and direction of wind, but the facts may be expressed in a general way by saying that a wave crest is on the point of breaking when its height above the trough behind it is equal to the depth of water below that trough. The depth of water in front of the wave which is about to break upon a sloping shingle beach depends upon the amount of backwash which it happens to encounter from the surge of the preceding breaker and it may even fall upon bare shingle.

Shingle beaches are the wave's own making, for wherever the conditions of supply cause a pile of pebbles to gather on the shore, the stones flung up by the waves tend to collect. These are driven up in the full depth of the surge flung by the breaker, but the settlement of water in the crevices of the shingle diminishes the depth of the backwash and consequently many stones are stranded. The stranding action is most marked with buoyant materials, hence the wrack of driftwood, sea-weed and shells which forms a line at the highest reach of the surge.

The seaward slope beyond low-water mark of spring tides at Eastbourne is extremely slight. This has two consequences, first that a large wave breaks far out from the shore, secondly that its discharge is not dissipated as a surge but initiates a new kind of wave which is transmitted to the shore across the intervening sheet of shallow water. The new wave is the perfect type of a bore, the foaming front very steep, the slope behind so gradual as to escape the notice of the eye. The foaming ridge travels steadily towards the shore with unchanging form but diminishing height. If we fix our attention upon a particular patch of foam we shall see that it is left behind by the foaming front as long as the water has some inches depth, but when the depth is reduced to about one inch the foam of the overfall is pushed along by the advancing ridge, accumulating in a scroll of froth which is finally left stranded on the sandy beach. These foaming ridges, sometimes called waves of translation, can be followed by the eye without difficulty, their individuality being persistent, but among deep-sea waves individuality is strangely elusive. The eye is attracted by and follows trustfully the wave which is larger than its fellows but soon finds that it is no longer looking at the largest wave, which is now the next behind, the first having outrun the supply of energy. This elusive effect is best illustrated in a group of waves in smooth water such as that produced by throwing a stone into a pond. The front wave of the group flattens out until it ceases to be visible while at the rear of the group a new wave appears. In water which is deep as compared with the wave-length the rate of advance of the group is only one half the speed of the individual waves, which travel through the group. In shallower water the waves do not so quickly outrun the energy and when the depth is very small in proportion to the wave-length the two rates of transmission are the same, and we have the typical bore, or wave of translation.

Wind always shifts during a storm, but deep-sea waves once formed travel with unchanged direction under the action of gravity, hence we should not think of a regular procession of long-crested ridges as typical but exceptional in a stormy sea, which is properly and characteristically a welter of over-riding ridges culminating in peaks which curl and break in caps of foam which the wind whips off and drifts in clouds of flying spray. In the course of many voyages the writer has only twice seen a really regular sea during a storm, that in the Bay of Biscay to which reference has already been made being the most spectacular because, when morning came, the clouds broke and a brilliant sun shone upon deep blue water laced and fretted with silver foam. The lofty standpoint of the navigating bridge gave a broad view of the great procession of mile-long crests charging on from the horizon, regular in alignment as ranks of cavalry and advancing at a speed of more than forty miles an hour.

Height of Waves.—Under certain conditions, however, the height of waves is more impressive than their crest-length or their speed. When during the growth of the waves in a storm the condition is reached at which each ridge or peak passing near the ship tops the horizon, the whole character of the scene is transformed. From a condition in which the waves seem mere mounds.

we suddenly pass to that in which they assume the appearance termed mountainous. When the vessel is buried in the trough of the waves only four or five ridges, comprising three or four wavelengths, intervene between the spectator and the horizon, but there is little to suggest that the view has been narrowed to an unusually small scale, and the steepness of the ship's side tends to make the horizon seem more distant than if the station were a sloping eminence of equal height. Moreover, the greater storm-waves usually occur during squalls, and these are often accompanied by driving rain which hazes the atmosphere and consequently seems to extend the view. The writer has observed such a narrow environment of four or five waves less than forty feet in height looking like a prospect some miles in extent with moving hills hundreds of feet high. (V. Co.)

WAXAHACHIE, a town of Texas, U.S.A. Pop. 7,958 in 1920 (23% negroes) and was estimated at 10,000 in 1928. It is the seat of Trinity university (Presbyterian), established in 1869. The city has flour, cottonseed-oil, and cotton mills, and a petroleum refinery. The Midlothian oilfield is 10 m. N.W. Waxahachie was founded in 1852.

WAX FIGURES. Beeswax is possessed of properties which render it a most convenient medium for preparing figures and models, either by modelling or by casting in moulds. At ordinary temperatures it can be cut and shaped with facility; it melts to a limpid fluid at a low heat; it mixes with any colouring matter, and takes surface tints well; and its texture and consistency may be modified by earthy matters and oils or fats.

Figures in wax of their deities were used in the funeral rites of the ancient Egyptians, and deposited among other offerings in their graves; many of these are now preserved in museums. That the Egyptians also modelled fruits can be learned from numerous allusions in early literature. Among the Greeks during their best art period, wax figures were largely used as dolls for children; statuettes of deities were modelled for votive offerings and for religious ceremonies, and wax images to which magical properties were attributed were treasured by the people. Wax figures and models held a still more important place among the ancient Romans. The masks (*effigies* or *imagines*) of ancestors, modelled in wax, were preserved by patrician families, this *jus imaginum* being one of the privileges of the nobles, and these masks were exposed to view on ceremonial occasions, and carried in their funeral processions. The closing days of the Saturnalia were known as *Sigillaria*, on account of the custom of making, towards the end of the festival, presents of wax models of fruit and waxen statuettes which were fashioned by the *Sigillarii* or manufacturers of small figures in wax and other media. The practice of wax modelling can be traced through the middle ages, when votive offerings of wax figures were made to churches, and the memory and lineaments of monarchs and great personages were preserved by means of wax masks as in the days of Roman patricians. In these ages malice and superstition found expression in the formation of wax images of hated persons, into the bodies of which long pins were thrust, in the confident expectation that thereby deadly injury would be induced to the person represented; and this belief and practice continued till the 17th century. Indeed the superstition still survives in the Highlands of Scotland. With the renaissance of art in Italy, modelling in wax took a position of high importance, and it was practised by some of the greatest of the early masters. The bronze medallions of Pisano and the other famous medallists owe their value to the art qualities of wax models from which they were cast by the *cire perdue* process; and indeed all early bronzes and metal work were cast from wax models. The *tête de cire* in the Wicar collection at Lille is one of the most lovely examples of artistic work in this medium in existence. Wicar, one of Napoleon's commissaries, brought this figure from Italy. It represents the head and shoulders of a young girl. It has been claimed as a work of Greek or Roman art, and has been assigned to Leonardo da Vinci and to Raphael, but all that can be said is that it probably dates from the Italian Renaissance. In Spain beautiful wax figures of saints, distinguished in form and colouring, were achieved in the realm of religious art. Till towards the close of the 18th century modelling of medallion portraits and of relief groups, the latter frequently polychromatic, was in considerable vogue throughout Europe. About the end of the 18th century Flaxman executed in wax many portraits and other relief figures which Josiah Wedgwood translated into pottery for his jasper ware. The modelling of the soft parts of dissections, etc., for teaching illustrations of anatomy was first practised at Florence, and is now very common. Such preparations formed part of a show at Hamburg in 1721, and from that time wax-works, on a plane lower than art, have been popular attractions. Such an exhibition of wax-works with mechanical motions was shown in Germany early in the 18th century, and is described by Steele in the *Tatler*. The most famous exhibition is that of Marie Tussaud (*q.v.*) in London.

WAX MYRTLE or **CANDLEBERRY,** popular names of species of *Myrica*, especially *M. cerifera* and *M. carolinensis* (bay-berry or wax-berry), small shrubs native to eastern North America, the fruits of which have a waxy covering and are utilized as a source of vegetable wax, used especially in New England for making candles. The Sierra wax myrtle or sweet bay (*M. Hartwegii*) is a similar shrub found in the Sierra Nevada mountains; the western wax myrtle (*M. californica*), a large evergreen shrub with resinous wax-covered fruit, occurs along the coast from Los Angeles to Washington. *M. Gale* is the native British gale or sweet gale (*q.v.*). *Rhus succedanea* is the wax-tree of Japan.

WAXWING, a bird (*Bombycilla garrulus*), the type of the Passerine family *Ampelidae*.

It is distinguished from almost all other birds by the curious expansion of the shaft of some of its wing-feathers at the tip into a flake that looks like scarlet sealing-wax. An irregular winter visitant, sometimes in countless hordes, to central and southern Europe, it was of old time looked upon as the harbinger of war, plague or death. The waxwing, though breeding yearly in some parts of northern Europe, is as irregular in the choice of its summer quarters as in that of its winter retreats. The species exhibits the same irregular habits in America. It has been found in Nebraska in "millions," as well as breeding on the Yukon and on the Anderson river.

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

CEDAR WAXWING, OR CEDAR BIRD, (BOMBYCILLA CEDRORUM)

Beautiful as is the bird with its full erectile crest, its cinnamon-brown plumage passing in parts into grey or chestnut, and relieved by black, white and yellow —all of the purest tint—the external feature which has invited most attention is the "sealing-wax" already mentioned. This is nearly as much exhibited by the kindred species, *B. cedrorum*, the cedar-bird or cedar waxwing, of North America, which is distinguished by its smaller size, the yellower tinge of the lower parts and the want of white on the wings. In *B. japonica*, of south-eastern Siberia, and Japan, the remiges and rectrices are tipped with red, but with no dilatation of the feather shafts. Both the waxwing and cedar-bird seem to live chiefly on insects in summer, but are addicted to berries during the rest of the year, and will gorge themselves if opportunity allow.

WAYCROSS, a city of Georgia, U.S.A. Pop. 18,068 in 1920 (55% negroes). Waycross ships lumber, naval stores, tobacco, corn, sugar-cane, and other agricultural products; and has railroad shops, meat-packing plants, fruit and vegetable canneries, lumber mills, a bee-hive factory and other manufacturing establishments. The city was founded in 1870 and chartered in 1909.

WAYLAND, FRANCIS (1796–1865), American educationist, was born in New York city on March 11, 1796. He graduated at Union college in 1813 and studied medicine in Troy and in New York city. In 1816 he studied theology in Andover Theological seminary, and in 1817–21 was a tutor at Union college, to which

after five years as pastor of the First Baptist church of Boston he returned in 1826 as professor of natural philosophy. In 1827 he became president of Brown university. In the 28 years of his administration he gradually built up the college, formed a library and gave scientific studies a more prominent place. He also worked for higher educational ideals outside the college, writing text-books on ethics and economics, and promoting the free school system of Rhode Island. His *Thoughts on the Present Collegiate System in the United States* (1842) and his *Report to the Corporation of Brown University* of 1850 pointed the way to educational reforms, particularly the introduction of industrial courses, which were only partially adopted in his lifetime. He died on Sept. 30, 1865. He was an early advocate of the temperance and anti-slavery causes. He was one of the "law and order" leaders during the "Dorr rebellion" of 1842, and was called "the first citizen of Rhode Island."

His son, FRANCIS WAYLAND (1826–1904) graduated at Brown in 1846, and studied law at Harvard; he became probate judge in Connecticut in 1864, was lieutenant governor in 1869–70, and in 1872 became a professor in the Yale Law school, of which he was dean from 1873 to 1903.

Among Wayland senior's numerous published works are: *Elements of Moral Science* (1835, repeatedly revised and translated into foreign languages); *Elements of Political Economy* (1837), in which he advocated free-trade; *The Limitations of Human Responsibility* (1838); *Memoirs of Adoniram Judson* (1853); *Elements of Intellectual Philosophy* (1854); and a brief *Memoir of Thomas Chalmers* (1864).

See *The Life and Labors of Francis Wayland* (1867) by his sons Francis and Heman Lincoln; the shorter sketch (Boston, 1891) by James O. Murray in the "American Religious Leaders" series; and an article by G. C. Verplanck in vol. xiv. of the *American Journal of Education*.

WAYLAND THE SMITH, hero of romance (Scand. *Völundr*, Ger. *Wieland*). The legend of Wayland probably had its home in the north, where he and his brother Egill were the types of the skilled workman, but there are abundant local traditions of the wonderful smith in Westphalia and in southern England. His story is told in one of the oldest songs of the Edda, the *Völundarkiða*, and, with considerable variations, in the prose *Þiðrekssaga* (Thidrek's saga), while the Anglo-Saxon *Beowulf* and *Deor's Lament* contain allusions to it. The first part of the tale contains obviously mythical features connected with his parentage and marriage. The second part concerns Völundr, lord of the elves, the cunning smith, who, with his sword Mimung, made famous in German epic poetry, defeated in fight at the court of king Niþoþr, the smith Amilias. Niþoþr, in order to secure Völundr's services, lamed him and established him in a smithy. The smith avenged himself by the slaughter of Niþoþr's two sons and the rape of his daughter Bodvildr, then soared away on wings he had prepared. The story in its main outlines strongly resembles the myth of Daedalus, but the dénouement of this tale, which first appeared in European literature in the *De obedientia* (*Opera*, Venice, 3 vols., 1518–19) of Jovianus Pontanus (d. 1503), is different. The Aaron of Shakespeare's *Titus Andronicus* was derived from this source. King Rhydderich gave a sword fashioned by Wayland to Merlin, and Rimenhild one to Child Horn. English local tradition placed Wayland Smith's forge in a cave close to the White Horse in Berkshire.

The earliest extant record of the Wayland legend is the representation in carved ivory on a casket of Northumbrian workmanship of a date not later than the beginning of the 8th century. The fragments of this casket, known as the Franks casket, were presented to the British Museum by Sir A. W. Franks. One fragment is in Florence.

See also Vigfússon and Powell, *Corpus poet. bor.* (i. pp. 168–174, Oxford, 1883); A. S. Napier, *The Franks Casket* (Oxford, 1901); G. Sarrazin, *Germanische Heldensage in Shakespere's Titus Andronicus* (Herrig's *Archiv.*, xcvii. Brunswick, 1896); P. Maurus, *Die Wielandsage in der Literatur* (Erlangen and Leipzig, 1902); C. B. Depping and F. Michel, *Véland le Forgeron* (Paris, 1833). Sir Walter Scott handled the Wayland legend in *Kenilworth;* there are dramas on the subject by Borsch (Bonn, 1895), English version by A. Comyn (London, 1898); August Demmin (Leipzig, 1880); H. Drachmann (Copenhagen, 1898); and one founded on K. Simrock's heroic poem on Wieland is printed in Richard Wagner's *Gesammelte Schriften* (vol. iii. 2nd ed., Leipzig, 1887).

WAYNE, ANTHONY (1745–1796), American soldier, was born in the township of Easttown, Chester county, (Pa.), on Jan. 1, 1745. He first saw service at the head of a Pennsylvania battalion during the retreat of Benedict Arnold, after the Quebec campaign. In 1777 he was commissioned brigadier-general, as a reward for his distinguished service at Ticonderoga. He took a prominent part in the battles of Brandywine and Germantown, and at Monmouth he turned the fortunes of the day by his stubborn and successful resistance. His greatest stroke was the storming of Stony Point, where in person he led the midnight attack of his troops over the walls of the British fort. This well-planned enterprise won for Wayne the popular sobriquet of "Mad Anthony." Wayne also did much to counteract the effect of Benedict Arnold's treason and of the mutiny of the Pennsylvania troops. In 1781 he was sent south to join Gen. Nathaniel Greene, but in Virginia he was deflected to aid Lafayette against Lord Cornwallis. In 1792 Washington appointed him to succeed St. Clair in the command of the western army with the rank of major-general. The Government continued its efforts to induce the Indians to allow white settlements beyond the Ohio, but upon the failure of a mission in 1793 Wayne advanced to Greenville, a port on a branch of the Great Miami. In July of 1794 Wayne's regulars were reinforced by about 1,600 Kentucky militia, and the combined forces advanced to Fort Defiance on the Miami river. Here Wayne made a final effort to treat with the Indians, and upon being rebuffed, moved forward and decisively defeated them in the battle of Fallen Timbers. This defeat, supplemented by the treaty of Greenville, which he negotiated with the Indians, on Aug. 3, 1795, resulted in opening the north-west to civilization. Wayne retained his position as commander of the army after its reorganization, and he rendered service in quelling the proposed filibustering expeditions from Kentucky against the Spanish dominions, and also took the lead in occupying the lake posts delivered up by the British. While engaged in this service he died at Erie (Pa.) on Dec. 15, 1796.

See J. Munsell, (ed.), *Wayne's Orderly Book of the Northern Army at Fort Ticonderoga and Mount Independence* (Albany, 1859); Boyer, *A Journal of Wayne's Campaign* (Cincinnati, 1866); William Clark, *A Journal of Major-General Anthony Wayne's Campaign against the Shawnee Indians* (MSS. owned by R. C. Ballard Thruston); Charles J. Stillé, *Major-General Anthony Wayne and the Pennsylvania Line* (Philadelphia, 1893); H. P. Johnston, *The Storming of Stony Point* (New York, 1900); J. R. Spears, *Anthony Wayne* (New York, 1903).

WAYNESBORO, a borough of Pennsylvania, U.S.A., near the Maryland boundary (the "Mason and Dixon Line"). Pop. (1920) 9,720 (97% native white). Waynesboro lies 710 ft. above sea-level, at the foot of South mountain, in the beautiful Blue Ridge region. Beneath are many caves and caverns. At Mont Alto, 6 m. N., is the Pennsylvania State Forest school (1903). A settlement was established here about 1734. For 20 years it was called Mount Vernon; then Wallacetown, until the close of the Revolution, when it was renamed in honour of Gen. "Mad Anthony" Wayne. A village was platted in 1797, and in 1818 it was incorporated as a borough. A municipal-manager form of government was adopted in 1922.

WAYNFLETE, WILLIAM (1395–1486), English lord chancellor and bishop of Winchester, was the son of Richard Pattene or Patyn, alias Barbour, of Wainfleet, Lincolnshire (Magd. Coll. Oxon. Reg. f. 84b), whose monumental effigy, formerly in the church of Wainfleet, now in Magdalen College Chapel at Oxford, seems to be in the dress of a merchant. He went to Oxford. In 1430 he was head master of Winchester college. In 1440 Henry VI. founded Eton College, and after visiting Winchester appointed Waynflete provost. Waynflete had to arrange for the financing and completion of the buildings at Eton. In the last year (1446–47) of his provostship the full roll of scholars, 70, was already complete. The provost was still in high favour with Henry, for when Beaufort, bishop of Winchester, Henry's uncle, died (April 11, 1447) Henry wrote the same day to the chapter of Winchester, the prior and monks of St. Swithin's cathedral, to elect Waynflete as his successor. On July 13, 1447, he was consecrated in Eton church, when the warden and fellows and

others of his old college gave him a horse at a cost of £6, 13s. 4d., and 13s. 4d. to the boys. Subsequent visits to Winchester inspired Henry with the idea of rebuilding Eton church on cathedral dimensions. Waynflete was principal executor of his "will" for that purpose.

Waynflete, as bishop, lost no time in following the example of Wykeham and his royal patron in becoming a college founder. In 1448 he obtained a licence for founding Magdalen College, Oxford. On Jan. 9, 1449 Waynflete was enthroned in Winchester cathedral in the presence of the king; and, probably partly for his sake, parliament was held there in June and July 1449, when the king frequently attended the college chapel, Waynflete officiating. When Jack Cade's rebellion occurred in 1450 Waynflete was employed with Archbishop Stafford, the chancellor, to negotiate with the rebels at St. Margaret's church, Southwark, close to Winchester House. A full pardon was promised, but on Aug. 1 Waynflete was one of the special commissioners to try the rebels. The king became insane in 1454. On the death of the chancellor, John Kemp, archbishop of Canterbury, during the sitting of parliament, presided over by the duke of York, commissioners, headed by Waynflete, were sent to Henry to ask him to name a new chancellor, apparently intending that Waynflete should be named. But no answer could be extracted from the king, and after some delay Lord Salisbury took the seals. During York's regency, both before and after the battle of St. Albans, Waynflete took an active part in the proceedings of the privy council. With a view to an ampler site for his college, Waynflete obtained on July 5, 1456 a grant of the Hospital of St. John the Baptist outside the east gate at Oxford and on July 15 licence to found a college there. Having obtained a papal bull, he founded it by deed of June 12, 1458, converting the hospital into a college with a president and six fellows, to which college two days later Magdalen Hall surrendered itself and its possessions, its members being incorporated into "the New College of St. Mary Magdalen."

Meanwhile Waynflete himself had been appointed chancellor, the seals being delivered to him by the king in the priory of Coventry in the presence of the duke of York, apparently as a person acceptable to both parties. In October 1457 he took part in the trial and condemnation for heresy of Reginald Pecock, bishop of Chichester. Only Pecock's books and not the heretic were burnt. Waynflete presided as chancellor at the parliament at Coventry in November 1459, which, after the Yorkist catastrophe at Ludlow, attainted the Yorkist leaders. It was no doubt because of this that, three days before the Yorkist attack at Northampton, he resigned the chancellorship (1460). But Waynflete does not seem to have been regarded as an enemy by the Yorkists, though he was a personal friend of Henry's, for the rights of the bishopric of Winchester were confirmed to him in 1462, and he took an active part in the restoration of Eton College under Edward IV., and in the building of the church, now called the chapel, at Eton. Yet he received a pardon in 1469, and in 1471, in the latter case probably because he welcomed Henry on his release from prison.

In 1474 Waynflete, being the principal executor of Sir John Fastolf, who died in 1459, leaving a much-contested will, procured the conversion of his bequest for a collegiate church of seven priests and seven almsmen at Caistor, Norfolk, into one for seven fellows and seven poor scholars at Magdalen. In the same year that college took possession of the alien priory of Sele, Sussex, the proceedings for the suppression of which had been going on since 1469. The new, now the the old, buildings at Magdalen were begun the same year, the foundation-stone being laid in the middle of the high altar on May 5, 1474 (Wood, 207). The college was completed in 1480, and this date, not the earlier one, is usually given as the foundation date. Magdalen College school was founded at the gates. In September 1481 Waynflete received Edward IV. in state at the college, where he passed the night, and in July 1483 he received Richard III. there in even greater state, when Master William Grocyn, "the Grecian," a fellow of New College, "responded," in divinity. In 1484 Waynflete gave the college the endowment for a free grammar school at his name-place, Wainfleet, sufficient to produce for the chantry-priest-schoolmaster £10 a year, the same salary as the headmaster of Magdalen School, and built the school which still exists almost untouched, a fine brick building with two towers, 76 ft. long by 26 ft. broad. The next year saw the appropriation to the college of the Augustinian Priory of Selborne, Hants.

Waynflete died on May 11, 1486, and was buried in Winchester cathedral. The effigy in Magdalen College Chapel at Oxford is an authentic portrait.

WAYS AND MEANS COMMITTEE: *see* ESTIMATES; EXCHEQUER.

WAYZGOOSE, a term for the annual outing of English printers and their employees. It may be a misspelling for "wase-goose," from *wase,* M.E. for "sheaf," thus meaning harvest goose, the "stubblegoose" mentioned by Chaucer in "The Cook's Prologue." It is more probable that the merry-making was an imitation of the grand goose-feast annually held at Waes, in Brabant, at Martinmas. Certainly the goose has long ago parted company with the printers' wayzgoose, which is usually held in July.

WAZIR, or VIZIER, a minister, usually the principal minister under a Mohammedan ruler (Arabic *wazir*). In India the nawab of Oudh was long known as the nawab wazir, the title of minister to the Mogul emperor having become hereditary.

WAZIRABAD, a town of British India, in Gujranwala district of the Punjab, near the right bank of the river Chenab, 62 m. N. of Lahore. Pop. (1921) 18,645. It is an important railway junction. The main line of the North-Western railway here crosses the Chenab by the Alexandra bridge, opened in 1876. Boat-building and manufactures of steel and iron are carried on.

WAZIRISTAN, a mountain tract in the North-west Frontier Province of India within the British sphere of influence, the boundary with Afghanistan having been demarcated in 1894. Only a portion, consisting of the Tochi valley, with an area of about 700 sq.m. and a population (1903) of 24,670, is directly administered. Northern Waziristan has an area of about 2,310 sq.m., and southern Waziristan an area of about 2,734 sq.m.

The Tochi and the Gomal rivers enclose the central dominating range of Waziristan from north-east to south-west, geologically connected with the great limestone ranges of the Suliman hills to the south, and dominated by the great peaks of Shuidar (Sheikh Haidar) and Pirghal, both of them between 11,000 and 12,000 ft. above the sea. From these peaks westwards a view is obtained across the grass slopes and cedar woods of Birmal and Shawal (lying thousands of feet below) to the long, serrated ridges of the central watershed which shuts off the plains of Ghazni. To the eastward several lines of drainage strike away for the Indus, and are, as usual, the main avenues of approach to the interior of the country. They are the Khaisora and the Shakdu on the north, which, uniting, join the Tochi south of Bannu, and the Tank Zam (which is also called Khaisor near its head) on the south. The two former lead from the frontier to Razmak and Makin, villages of some local importance, situated on the slopes of Shuidar; and the latter leads to Kaniguram, the Waziri capital, and the centre of a considerable iron trade. Kaniguram lies at the foot of the Pirghal mountain.

The Waziri tribes are the largest on the frontier, but their state of civilization is very low. They are a race of robbers and murderers, and the Waziri name is execrated even by the neighbouring Mohammedan tribes, who seem inclined to deny their title to belong to the faith. Their physique is excellent.

Except in a few of the highest hills, which are well-wooded, the Waziri country is a mass of rock and stones, bearing a poor growth of grass and thinly sprinkled with dark evergreen bushes; progress in every direction is obstructed by precipices or by toilsome stony ascents, and knowledge of the topography comes only as the result of long acquaintance. Broken ground and tortuous ravines, by making crime easy and precaution against attack difficult, have fostered violence among the people and developed in them an extraordinary faculty of prudence and alertness. The Waziri has developed into a raider, and a highwayman. The women enjoy more freedom than amongst most Pathan tribes. The blood-feud is a national institution.

The Waziris, who number some 48,000 fighting men altogether,

are divided into two main sections, the Darwesh Khel (30,000), referred to as "Wazirs," and the Mahsuds (18,000), with smaller sections and attached tribes numbering 18,000 more.

The Darwesh Khel are the more settled and civilized of the two, and inhabit the lower hills bordering on Kohat and Bannu districts and the ground lying on both sides of the Kurram river, between Thal on the north and the Tochi Valley on the south. The Mahsuds, who inhabit the tract of country lying between the Tochi Valley on the north and the Gomal river on the south, have earned for themselves an evil name as the most confirmed raiders on the border. The Mahsud country, especially that part within reach of British posts, is more difficult even than Tirah. The Tochi Valley is inhabited by a degraded Pathan tribe, known as Dauris, who have placed themselves under British protection since 1895.

British expeditions were needed against various sections of the Waziris in 1852, 1859, 1860, 1880, 1881, 1894, 1897 and 1902.

The success of Sir Robert Sandeman in subduing the wild tribes of Baluchistan had led to a similar attempt to open up Waziristan to British civilization; but the Pathan is much more democratic and much less subject to the influence of his maliks than is the Baluchi to the authority of his chiefs; and the policy finally broke down in 1894, when the Waziris made a night attack upon the camp of the British Delimitation Commission at Wana. The attack was delivered with such determination that the tribesmen penetrated into the centre of the camp, and it was only with the greatest difficulty that friend could be distinguished from foe. A large force of 11,000 British troops subsequently traversed the tribal country, destroyed their towers and dictated terms, one of which was that the Tochi Valley should be occupied by British garrisons. But still there was trouble, which led to the Tochi expedition of 1897; and, in spite of the further lessons taught the Waziris in two expeditions in 1902, the attempt to "Sandemanise" Waziristan was given up by Lord Curzon. The British garrisons in the Tochi and Gomal valleys were withdrawn, and two corps of tribal militia, from 1,300 to 1,500 strong, were gradually formed to replace the British troops. During the Great War, the Mahsuds gave constant trouble and during the third Afghan war the militia were withdrawn, portions going over to the enemy. Three years of war succeeded the invasion, and it was not till a motor road was driven from Jandola through the heart of the country to Bannu, and a large cantonment built at Razmak, close to the centre of the Mahsud country that order was restored.

See *Grammar and Vocabulary of Waziri Pashto*, by J. G. Lorimer (Calcutta, 1902); Paget and Mason's *Frontier Expeditions* (1884); *Mahsud Waziri Operations* (1902), Blue-book.

CAMPAIGNS IN WAZIRISTAN

The Wazirs are Pathans speaking Pushtoo. Consequently, they have a very close racial and linguistic affinity with the adjacent Afghan population. The country, moreover, lies midway between the Khyber and Bolan Passes and has thus remained outside the orbit of the chief campaigns that have been fought on the north-west frontier. In addition, it had never been subjected to the administration of the Government of India.

There is no need to recount in detail the course of the earlier expeditions into Waziristan. In 1860, after some stiff little actions a column of all arms occupied Kaniguram and Makin, the centres of population in Mahsud country. Again, in 1879, the Mahsuds were subjected to an economic "blockade." In 1893 a well-conducted expedition under Sir W. Lockhart overran Waziristan. In 1896 Wana was occupied at the request of the Wazirs themselves. In 1900 a second blockade of the Mahsuds was initiated, but dragged on for over a year until several columns had devastated the most fertile of the Mahsud valleys. In 1917 a brief expedition penetrated up the R. Shahur and effected a temporary submission of the Mahsuds.

The close of the World War was followed in May, 1919, by the outbreak of the Third Afghan War. For some time past Wazirs and Mahsuds alike, excited by Afghan propaganda, had been growing bolder in their brigandage. The climax came when the evacuation of the military posts maintained in the Tochi and Gumal Valleys was effected. Both these trade routes had past been guarded by fortified posts garrisoned by native forces known as the Northern and Southern Waziristan Militia respectively. These forces, composed of tribesmen under British officers, with few exceptions deserted early in 1919, and thereby provided their Mahsud compatriots with an invaluable stock of rifles and ammunition; while, more serious still, they formed a nucleus of skilled leaders for the *lashkars*. However, in December, 1919, an expeditionary force was under the command of Major-General S. H. Climo, C.B. The total of this force amounted to no less than 30,000 combatants, figures later augmented.

On Nov. 9 the first move was made up the Tochi Valley, where, on the 17th, General Climo received unconditional surrender of the Tochi Wazir tribes at a ceremonial *jirga* held at Datta Khel. This result enabled the striking force to be transferred southwards to deal with the Mahsuds. It was now decided to move the striking force to the Tank Zam valley and to advance in one column by that route to Kaniguram and Makin in the heart of the Mahsud country. The force was completely assembled at Jandola on the Tank Zam by December 13, whereupon a beginning was made to piquet the valley on either flank by "crowning the heights" with small fortified works.

On Dec. 17 the Mahsuds made a fierce and somewhat treacherous onslaught on the advanced troops of the striking force, or "Derajat column," under cover of a parley. They were driven back and the column moved next day. An attempt to seize Mandanna Hill, made on the 19th, failed. A second attempt, on the 20th, conducted by stronger forces as well as supported by aircraft, met with negligible resistance; the occupation of the ridge was complete. Leaving 100 men to complete the fortification of a detached post on the hill, the troops returned to camp. No sooner had they withdrawn than a fierce Mahsud attack swept away the remaining detachment, and the hill was lost again. A similar attempt to seize Tarakai or Black Hill on the 22nd eventually succeeded, but not before some savage Mahsud attacks had nearly brought about another similar defeat. The Mahsud losses, occasioned by some close quarter fighting and artillery fire, proved very heavy for this class of warfare. Tarakai was held as the enemy retired.

On the 25th Mandanna Hill was occupied afresh and permanently. An advance of 4 miles was made to Kotkai where the column remained until Jan. 7, preparing to force a precipitous defile known as the Ahnai Tangi. A first attempt was made on the 7th. Owing to the short hours of daylight, the operation was abandoned. A second attempt, on the 9th, met with no better result. Once more, on the 10th, a third attempt failed. In view of this situation, now daily growing more unsatisfactory, General Skeen ordered a night march for the small hours of the 11th. This bold decision, unusual in mountain warfare, was justified by the result. On the 14th the entire column passed through the defile.

The task was still formidable. The eastern bank of the Tank Zam was formed by two long ridges, the nearer being christened "Flathead Left" and the further "Flathead Right," while to the north of a deep depression came yet another height dubbed "Marble Arch." The right flank guard soon became heavily engaged on Flathead Left while the advanced guard met with a heavy fire from Marble Arch and was checked. After a very stubborn and savage action at close quarters, Flathead Left was taken and held throughout the day, aircraft contributing to this result. The column was then able to encamp undisturbed. After a night march on the 28th, the column passed through the gorge.

Although the Mahsud resistance was on the wane, Afghan emissaries were busy stirring them to further efforts. Two Afghan mountain guns arrived to reinforce moral persuasion. On Feb. 1, General Skeen once more ordered a night march against the Mahsud position, held in great strength, near Aka Khel. A striking success resulted; the enemy's resistance collapsed with no seeming hope of its reviving; Afghan help did not materialize, while the two mountain guns proved but a dismal failure. From this moment onwards there was to be no more serious fighting. But the Mahsuds showed no sign of accepting the Government's terms and so the column marched further up the Tank Zam Valley. But there was a change of policy in that there was now

a coercive policy enforced, appropriate measures being taken for the destruction of Mahsud property.

On Feb. 16 the column arrived at Tauda China, 2 m. distant from Makin, which centre of population and agriculture, failing submission by the Mahsuds, was to be ravaged. According to the terms of an ultimatum, the days of grace expired on Feb. 19, when, until the 29th, the fortified Mahsud villages were systematically shelled or raided. On March 2 the column moved to Kaniguram, the only so-called "town" of the the Mahsud country. The place itself was not occupied, the troops being kept within a fortified camp constructed at Ladha close by the town. The resulting situation proved embarrassing. A certain number of rifles were surrendered, but as a whole the Mahsuds remained untamed and hostile. The column remained at Ladha when, on April 6, it carried out an important punitive operation north-west of Kaniguram. This showed the tribesmen to be still as contumacious and bellicose as ever. Ladha was consequently converted into a standing camp connected with Tank by a strong series of posts down the Tank Zam valley. The Waziristan force was reduced, the Derajat column as such was broken up; one brigade remained at Ladha while another guarded the road to Tank. Then finally, in the autumn, the long deferred expedition to Wana was organized as the Wana Wazirs had failed to comply with the Government's demands for reparation for the outrages of 1918–19. Moreover, the Wazirs were then undoubtedly harbouring Afghan agents who were intriguing against the Government of India.

On Nov. 12 the Wana column, commanded by Major-General W. S. Leslie, C.M.G., left Jandola for Sarwekai where a lengthy pause was made. Then, on Dec. 15, the troops moved again and reached Wana on Dec. 22. The only incident of the advance was a spirited little affair at the pass of Granai Mara Narai where a night march once more dislodged the Wazirs from their position virtually without fighting. The beginning of 1921 thus found a brigade of Indian troops at Ladha and Wana respectively with every prospect of a permanent occupation of Waziristan. But one important circumstance was about to alter the entire problem of Waziristan. A great circular motor road was now to be constructed from Bannu up the Tochi Valley; thence across the passes to Razmak and so down the whole Tank Zam valley to Tank. This road would allow of military operations being conducted under very different conditions to those prevailing in 1919–20. Moreover, the Royal Air Force was now in possession of a new aerodrome at Dardoni in the Tochi Valley. Lastly, two 6-inch howitzers were to be stationed at Ladha.

At the close of 1922, on the impending completion of the new motor road, the garrison of Ladha was ordered to move into the new and more salubrious camp of Razmak. The Mahsuds, mistaking this change for a symptom of weakness, committed acts of open hostility. The situation grew so bad that punitive operations became inevitable. The plan of operations was for one brigade to advance from Razmak and to unite with the brigade from Ladha in the Makin area. Before this could be effected the last stages of the motor road had to be completed and this proved an arduous task. Starting from Idak in the Tochi Valley the 7th Brigade reached Razmak on Jan. 23, then effecting a junction with the 9th Brigade from Ladha on Feb. 4 at Tauda China. The Makin area was once more devastated; aeroplanes, 6-inch and 3·7 howitzers were all employed in the task. By the 12th enough destruction had been accomplished, and on the 22nd the last recalcitrant tribes made their submission.

WAZZĀN, a small town, 60m. N.W. by N. of Fez, Morocco, on the slopes of the Djebel Bu-Hallal. Wazzān, chief town of a territory, has 12,910 inhabitants, of whom 594 are Europeans. It manufactures a coarse white woollen cloth, from which the hooded cloaks (called *jellābs*) are made. Its proudest name is Dár D'manah—House of Safety—as it is sanctuary for any who gain its limits, on account of the tomb of a sainted Idrisi Sherif, who lived there in 1727, and was the founder of one of the most important religious brotherhoods of the Muslim world, called the Taïbiya. After the conquest of Algeria, the sherifs of Wazzān, chiefs of the brotherhood, were placed under the protection of France. The French troops entered Wazzān in 1920.

WEAKFISH (*Cynoscion regalis*), an important North American food-fish, so-called from its tender mouth. It inhabits sandy shores of the Atlantic coast from Cape Cod to Florida and is greenish-brown above, silvery below, with brown markings. The weakfish is also known as squeteague and sea-trout (its trade name). It reaches a weight of 30 lb. (average 5 lb.).

WEALD, THE, a district in south-east England. It includes the portions of Sussex, Kent and Surrey enclosed between the North and South Downs. With the exception of the eastern part, it is drained by rivers running northward and southward through gaps in the Downs (*q.v.*). The Weald was formerly covered by the forest of Andredesleah or Andredsweald ("the wood or forest without habitations"). About 1660, the total area under forest was over 200,000 acres. The chief remains of the forests are Ashdown, St. Leonards and Tilgate, and the nomenclature often indicates former woodland, as in the case of Hurstpierpoint (*hurst* meaning wood), Midhurst, Fernhurst, Billingshurst, Ashurst and many others. The forests were interspersed with lagoons; and the rainfall caused marshes. The Wealden forests were used extensively for fuel in the former ironworks of Sussex. The Forest Ridges, running east to west in the centre of the Weald, preserve its ancient character. Formed of the Hastings sands they are the main water-parting of the Weald, dividing the Vale of Sussex from the Vale of Kent. Here the iron industry, worked by the Romans and earlier, became important in the 16th and 17th century and died out early in the 19th century. The Andredesleah formed a physical barrier which kept the South Saxons isolated from other Saxon kingdoms.

WEALTH. In economics wealth may mean either a stock or fund existing at a given time or a flow of valuable goods and services during a period of time. In dealing with the production, exchange, distribution and consumption of wealth, economics is concerned very largely with the origins of the community's annual income and with the disposition which is made of it. This annual flow of income, or national dividend, may be conceived of as comprising all of the valuable commodities which pass into the hands of their final consumers during the year, together with the valuable personal services (*e.g.*, the services of the Government, of physicians, of actors, of household servants) rendered during the year, apart from those which come to the consumer embodied, as we might say, in the products of industry and trade. Alternatively, the community's annual flow of wealth may be identified with its annual product, which comprises the personal services directly rendered to consumers, as aforesaid, together with the results of all that is accomplished during the year in forwarding products towards their final form and destination, and in augmenting the community's productive equipment. The two conceptions overlap, for both include the products of work which is performed and comes to its final fruition within the year. But one conception includes, in addition, the ripened fruits of work done in the past, while the other includes fruits of present work which will reach their maturity only in future years. The money value of what we may call consumers' real income (the first of the two conceptions) will not, in general, be the same as the money value of the annual product. In a prosperous community, where saving is growing relatively to consumption, the money value of the annual product will be the larger of the two. It is always approximately equal to the aggregate amount of the net money incomes received during the year. It lends itself better to statistical measurement than consumers' real income does, and, it is the better index of the community's economic welfare.

Viewed as a stock or fund, wealth is an aggregate of scarce and valuable objects. Some of these valuable objects are given by nature, others are the products of man's industry and thrift, but all of them, irrespective of their origins or their cost, are valued prospectively, looking towards the future, with reference to their importance as aids to production or to their more direct beneficial uses. Wealth can be described by means of a stock-taking or inventory, but it can be summed or measured as a whole only in terms of its money value. Wealth is always something owned, whether the ownership be private or public. Its value is the sum of the values of existing property rights. Securities, such as stocks,

shares and bills, are among the objects of property, but if these are to be counted as wealth, account must be taken of the circumstance that they are offset by an equal amount of "negative wealth" —the liabilities of their issuers. In arriving at the wealth of the people of a given country or region (as distinguished from the wealth *within* that country or region), the net balance of external assets and external liabilities must be included.

It is obvious that the degree of a country's economic well-being depends upon the character and extent of its unappropriable resources—sunshine, rainfall, rivers, harbours—as well as upon the appropriable objects of wealth within its borders. Is not a navigable river, therefore, as much an item in a nation's wealth as a railway or a canal? Yes, in the sense that a nation's wealth is larger because of an abundance of these natural advantages. No, if is meant that no evaluation of a nation's wealth is complete if separate account is not taken of such things. (*See* also ECONOMICS and CAPITAL.) (A. Yo.)

WEALTH, NATIONAL. The wealth of a country may mean *either* the value of the objects found within its boundaries, regardless of the ownership of those objects in part by people living abroad, or the wealth of the inhabitants, including their foreign possessions, and excluding wealth within the country held by people abroad. The confusion between these two ideas has played havoc with discussions on such subjects as "The Taxable Capacity of Ireland." (*Vide* Stamp's *British Income Property* p. 369.) It is the latter sense—the wealth of the inhabitants expressed in current money values—that is mainly under consideration here.

Wealth in private hands (or belonging to individuals) is not easy to define, for there are various shades of ownership:

(1) Absolute personal disposition of the whole "fee simple" value of a house, land or other object.

(2) Trust interests, where ownership is more limited and free disposal is barred, but where the ownership of a source of income for a period has a capital value.

(3) Collective ownership with only potential specific allocation to individuals, such as the reserves of companies which may be of higher value in the hands of the company than the aggregation of the market value of individual interests therein.

(4) Collective ownership, without the *possibility* of individual allocation, or social private wealth, such as churches, clubs, etc.

(a) City and local property, like waterworks, buildings and trams, having a "value" determinable by deliberate comparison with privately owned objects.

(b) National property, varying from a museum to a navy, which can less easily be given a "purchase price."

Uses to Which the Figures of National Wealth Are Put. —These include:

(1) Tests of "progress," by way of comparisons between different years, to show the accumulation of capital, and really valid where the level of prices has remained fairly constant; tests of the distribution of wealth, according to the form or embodiment which wealth takes, *e.g.* between houses, lands and bonds; tests of the effects of changes in the rate of interest, or in the value of money.

(2) Tests of the relative "prosperity" or resources of different nations or communities, at the same point of time either as a whole, or per head of the population, and also in relation to their national debts and taxation.

(3) Comparisons of income with capital and property.

(4) Consideration of the distribution of wealth according to individual fortunes, and changes in that distribution.

(5) Consideration of the applicability and yield of schemes of taxation, *e.g.*, the capital levy.

(6) Questions relating to war indemnities and "ability to pay."

The summary presented to the Royal Statistical Society by Sir Josiah Stamp in May 1919 endeavoured to present the position as in 1914. High authorities had argued that the wealth of the United Kingdom in 1914 was approximately £10,000,000,000, others had placed it as high as £24,000,000,000, but in each case the estimates were associated with polemical matters. Sir Josiah's figure was £14,310,000,000.

Methods of Computation.—(1) *Based on data arising through the taxation of incomes.* (a) *Collective Taxation or Taxation at the Source.* The statistics of such taxation covering the whole profits of corporate bodies, such as public companies, before their distribution to individuals and whether actually distributed or not, obviously lead to comprehensive results. Where *sources* of income are attacked for revenue purposes, and the *destination* of income is ignored, it is not necessary for elaborate estimates to be made for income remaining in collective or semi-collective ownership; moreover, such a tax system allows of profits being presented for different classes of business or income, and so enables them to be capitalised on an appropriate basis. There may, however, be a danger that this method will give too high a result, if sufficient allowance is not made for income going out of such companies to foreigners or persons living entirely abroad, which thus forms no part of the national income.

Risk of error arises in three ways:

(i.) Evasion in the tax system itself.

(ii.) Legal omissions from the scheme of tax (*i.e.*, "garden produce" as non-taxable income, "enjoyment" income from movable property).

(iii.) The basis of capitalisation, viz., the number of years purchase adopted.

This method, generally known as the "Giffen" method, though not invented by him, is the main basis for the valuation for the United Kingdom. It will be found to a limited extent available in the United States, South Africa and other dominions.

(b) *Taxation of income on Individual Returns.*

Where statistics of this character are available, they may be utilised for capital valuations, but only with some difficulty. If there is a rough division of income into earned income and income from property, it is, of course, of assistance in the capitalisation. The chief defects are:

(i.) The considerable extent to which evasion takes place in this particular type of taxation.

(ii.) Omission of all income held or accumulated collectively.

(iii.) Difficulty in determining the ratio of income to capital on the average, which makes capitalisation a far greater difficulty than under (a) (iii.) above.

(2) *Based on Material Provided by the Annual Taxation of Capital.*

(a) *Particular Classes of Property, such as Land or Buildings.*

Obviously these details supply a part only of the whole capital valuation, and they more properly belong to the "inventory method" referred to below. Unless the values are regularly revised on uniform lines, without local differences, they form but a rough basis, and there are always difficulties in determining the extent to which other forms of wealth (*i.e.*, company shares or business profits) duplicate these values. Some of the Continental systems of taxation supply material of this order, and the Australian States have regularly revised valuations which are valuable because they constitute so large a fraction of the total wealth.

(b) *General Property Valuation.*—The particulars furnished by a system of annual taxation upon all classes of property, should, in theory, form an ideal basis for a valuation. As a matter of fact, however, in practice, even such a tax as the General Property Tax in the United States, is full of defects. The valuations of personal property tend to disappear altogether (as was the case during the eighteenth century with the British "Land Tax") or else to be negligible in amount, leaving real property alone to bear the burden. This real property is assessed on very diverse lines in different areas, and is admittedly much below the selling values in many States.

(3) *Based on Data arising through Taxation of Capital at Irregular Periods.*

(a) *Statistics of "Estates" chargeable with Duties on passing at Death.*

This method has the appearance of being the most satisfactory and scientific of all. A special *ad hoc* valuation is made periodically of all wealth held in individual ownership, and it is only required to ascertain what proportion of the whole comes under

review in any given year, or, alternatively, at what intervals of time the same item of wealth will be recharged to duty on the average, in order to compute the total wealth belonging to individuals. But this apparently simple task is, in practice, fraught with many difficulties, and the method of ascertainment of the "multiplier," though greatly improved of late years, is still open to doubt or inquiry upon important points. The adequacy of the capitalisation of collective wealth and the impossibility of saying how much is *not* reflected in their values are serious drawbacks.

(4) *The Inventory Method.*

This method aims at a valuation, in the aggregate, of each "form" in which wealth is embodied, without regard to the ownership by individuals, companies, etc. It is often called the "objective" method. It depends for its success almost entirely upon the existence of statistical material compiled for other purposes, *e.g.*, import and export statistics, local government taxation figures, expert valuations of mineral resources, statistical enumerations of objects to which an average value can be applied. Examples of the last mentioned are the valuation of shipping by reference to the total tonnage multiplied by an average value per ton, or of mining capital by the average capital invested per ton of output, or of live stock by the number of each kind multiplied by an average price, or even of business, by a co-efficient. There are few classes of statistics that have not been pressed or coaxed into service for the "inventory" method, and further illustration can best be seen below.

The chief defects of the method are:

1. The impossibility of testing how far the ownership of the wealth is within the country or not. It is obvious, for example, that if half the farms in a country are mortgaged to or owned by foreigners, their gross value will give a false statement of national wealth in the sense defined.

2. The difficulty of determining whether all forms of wealth have been included.

3. The risk of overlapping, *e.g.*, stock and shares duplicated with real property owned by companies.

4. The absence of tests of profit earning capacity. For example, the carriages, railway lines, stations, etc., of a railway company are all "valued," and their aggregate comes to, say, £5,000,000. The railway as a whole may have been losing money for years, or, may be making several millions a year.

It is contended however that this difficulty may be exaggerated. As a general rule, on capitalisation of plus and minus "goodwill," the differences tend to cancel out, and an aggregate of valuations as "going concerns" tends to approximate to invested capital, except when there are striking changes in the value of money and rate of interest.

British National Wealth.—Sir Josiah Stamp's valuation of British national wealth for 1914 was as follows:—

	Capital value (Million £)
1. Lands	1,155
2. Houses, etc.	3,330
3. Other profits (Sch. A)	22
4. Farmers' capital	340
5. Sch. C, National Debt, etc.	1,148
6. Railways in the United Kingdom	1,143
7. Railways out of the United Kingdom	655
8. Coal and other mines	179
9. Ironworks	37
10. Gasworks	182
11. Waterworks, canals, and other concerns (Sch. A)	278
12. Indian, colonial, and foreign securities	621
13. Coupons	383
14. Other profits and interest	276
15. Businesses not otherwise detailed	2,770
16. Income accruing abroad and not remitted	400
17. Income of non-income-tax paying classes derived from capital	200
18. Movable property, etc., not yielding income (furniture, etc.)	800
19. Government and local property	400
Total valuation	14,319
Or, in round figures	14,300

5. The difficulty of accurately determining any "averages" employed as factors. If they are the results of impressions, they may be considerably in error, and even if they are the product of actual observations they ought usually to be carefully "weighted" in their application to the different classes. He has also given the following record for previous years:—

Date	£ millions.	
1800	1,750 (Great Britain)	Beeke
1812	2,700 (United Kingdom)	Colquhon } Vide Giffen, "Growth of Capital," p. 110

Wealth of Various Countries.—Sir Josiah Stamp's summary of the estimated wealth of eighteen leading countries of the world at the outbreak of the World War in 1914 is set forth in the accompanying table giving the total wealth for each country and also the amount *per caput* of the population.

Country	National capital			
	Estimates based on the work of	Approximation to accuracy: Grade*	Amount in million £	Amount per head of population
				£
United Kingdom	Stamp	I.	14,500	318
United States	Official, King	II.	42,000	424
Germany	Helfferich, etc.	II.	16,550	244
France	Pupin, Théry	II.	12,000	303
Italy	Gini	III.	4,480	128
Austria-Hungary	Fellner	III.	6,200	121
Spain	Barthe	IV.	2,940	144
Belgium	Official	III.	1,200	157
Holland	Stuart	III.	1,050	167
Russia	Neymarck	IV.	12,000	85
Sweden	Flodstrom, Fochlbeck	III.	940	168
Norway	Gini	IV.	220	90
Denmark	Gini	IV.	500	176
Switzerland	Gini	IV.	800	205
Australia	Knibbs	I.	1,530	318
Canada	Bankers' Assocn.	II.	2,285	300
Japan	Stamp	IV.	2,400	44
Argentine	Bunge	III.	2,400	340

*Grade I. Estimate is not likely to be inaccurate to a greater extent than 10 per cent.
Grade II. Estimate is not likely to be inaccurate to a greater extent than 20 per cent.
Grade III. Estimate is not likely to be inaccurate to a greater extent than 30 per cent.
Grade IV. Estimate may be inaccurate to a greater extent than 40 per cent.

Post-War Estimates.—Owing to economic dislocation, to the rapid changes in the value of a common measure, gold, and to still more rapid change of national currencies as well as various other factors that must be considered, no really reliable estimates have been possible. Many rough guesses have been made, *e.g.*,

National Wealth of Certain Countries

Country	Year	National wealth	In sterling at par	In sterling at current rate of exchange in May 1926	Current rate of exchange in May 1926
Great Britain	1923	£20,000 millions	..	£20,000 millions	
Canada	1923	$25,000 ,,	£ 5,100 millions	£ 5,400 ,,	$4·465 = £1
India	1922	Rs. 15,000 crores	£10,000 ,,	£10,000 ,,	15 rs. = £1
United States	1923	$355,000 millions	£72,900 ,,	£81,200 ,,	$4.37 = £1
France	1923	Fr. 1,200,000 ,,	£47,600 ,,	£14,400 ,,	82·88 fr. = £1
Italy	1923	L. 611,000 ,,	£24,222 ,,	£ 6,100 ,,	100 15–32 lire = £1

Wealth of the United States.—The most recent figure of the wealth of the United States, was a Government estimate for 1922 of 321,000 million dollars, or, say, 65,000 million £. The savings of the United States since that time indicate that the total wealth at the end of 1928 will amount to $394,500,000,000, an increase of 22·9 per cent. over the 1922 figure. The wealth of the United States has increased at a faster rate than the population. The per capita wealth is estimated to have increased from $2,938 in 1922 to $3,287 in 1928. The prospect is that the total wealth at the end of 1929 will amount to $408,700,000,000 and the per capita wealth to $3,366.

The following table shows the estimated savings and increase in wealth of the United States since 1922.

Savings and Wealth of the United States

	Total savings	Total wealth	Per capita wealth
1922	$ 9,200,000,000	$321,000,000,000	$2,938
1923	10,800,000,000	331,800,000,000	2,998
1924	11,100,000,000	342,900,000,000	3,059
1925	12,100,000,000	355,000,000,000	3,077
1926	12,600,000,000	367,600,000,000	3,138
1927	13,200,000,000	380,800,000,000	3,210
1928	13,700,000,000	394,500,000,000	3,287
1929	14,200,000,000	408,700,000,000	3,366

The same authorities estimate the wealth of the entire British Empire as $210,000 million and the whole world at $1,100,000 million. This means that the United States, with only 6·3 per cent. of the world's population and only 5·3 per cent. of the world's land area, has approximately 35 per cent. of the world's wealth. The United States has 78 per cent. of all the automobiles in the world, 72·5 per cent. of the telephones, 58·5 per cent. of the telephone and telegraph lines, 38·3 per cent. of the monetary gold, 34 per cent. of the railroad mileage, 23·6 per cent. of the hogs, 21·7 per cent. of the ships, and 21·5 per cent. of the cotton spindles.

The recent stabilisation of currencies in most of the civilized countries of the world, will enable, as soon as their immediate effects have been worked into the economic conditions, more systematic calculations of comparative national wealth to be made. A defect of all post war estimates up to the present is the absence of information as to how the most important question of internal debt has been handled, *i.e.*, whether, if it is treated as wealth in the hands of bond holders, it has been deducted from the other gross values of national property or not.

BIBLIOGRAPHY.—*Journal of the Royal Statistical Society*, various dates, on the "Multiplier." *See* Leo Chiozza Money, *The Nation's Wealth* (1914); Sir Josiah Stamp, *British Income and Property* (1916), and *Current Problems in Finance and Government*. (J. S.)

WEALTH, PRIMITIVE. In primitive society the social character of wealth is more apparent; the freedom of individuals to dispose of it is limited by the interests of the community as a whole. The motives which lead to its accumulation are not purely economic, for ambition and rivalry play an important part. Transfer of it from one person to another is ruled by etiquette, often onerous, its observance backed by force of custom. Primitive wealth is embodied in objects of interest, these varying in type in different cultures. Among many African tribes cattle are the greatest treasure; the Indians of north-west America chiefly prize furs, canoes and copper plaques. In some societies human beings possess an acknowledged economic worth, women and slaves being transferable wealth. The close dependence of uncivilized people upon nature renders food a universal object of value. But primitive wealth is not confined to things of purely practical interest. Luxury articles are often most prized. In the Pacific, fine woven mats (Samoa), feather capes and cloaks (Hawaii), large polished axe blades (New Guinea), and ornaments such as whales' teeth (Fiji), greenstone *heitiki* figures (New Zealand), or shell armlets and necklaces (Melanesia) play a most prominent part in the socio-economic life.

In primitive society rank and wealth usually go hand in hand By gift, loan and rewards for service chiefs dispose of their income to their people, and, generosity being esteemed a prime virtue, maintain thereby their prestige and influence. The importance of wealth lies in its distribution; hoarding is condemned. But as the economic and social life is built upon reciprocity, freedom in giving is also conducive to material prosperity. Destruction of wealth, as in the Amerindian potlatch, springs from an exaggeration of this attitude of respect for wealth in action.

The manipulation of primitive capital and the financing of native enterprise on a large scale proceeds along these lines. When for example a Maori community desired to build a new house or canoe the chief generally took the lead. From his stores of wealth he provided gifts for specialist craftsmen. At the stages of work where a large quantity of labour power was required he assembled the people and by providing them with meals, a feast or gifts of food, furnished the necessary incentive to them to undertake the task. The economic activities of a primitive people are marked by this constant circulation of wealth.

See B. Malinowski, "Primitive Economics of Trobriand Islanders," *Economic Journal* (1921), *Argonauts of the Western Pacific* (1922); R. Thurnwald, "Die Gestaltung der Wirtschaftsentwicklung," *Erinnerungsgabe für Max Weber* I. (1923); art. "Reichtum" in M. Ebert's *Reallexikon der Vorgeschichte;* R. Firth, "Some Features of Primitive Industry," *Economic Journal* (1926). (R. F.)

WEALTH AND INCOME, DISTRIBUTION OF. Modern enquiries into the distribution of capital wealth are mainly confined to the total wealth of individuals in classes according to the amount of total fortune in each grade, whereas enquiries into the distribution of income, while predominantly similar in the attention given to relative amounts, also extends to two other fields. There is a consideration of the distribution according to trades and occupations (*e.g.*, the shares which agriculture, mining, etc., represent of the aggregate) and the third type divides income according to its economic character—interest on capital, economic rent, the reward of work by hand or brain.

Distribution of Capital Wealth Amongst Individuals.—Information on the question is almost entirely derived from the government statistics of taxation of estates falling under liability at death. It is necessary to ascertain by the tables of mortality the number of people *living* at any time for *each death* in each grade. The highest fortunes tend to be held by the oldest people and, therefore, the "multiplier" in these grades is quite small compared with that in the lower grades of fortune where the average age of those coming under liability to estate duty is lower. The large fortune with a small multiplier and the small fortune with a larger multiplier, tend to give some equality to the *total* fortunes at each grade in ages. The result of the whole computation is generally known as the "multiplier," and this is applicable to the total sum falling under charge in a year in order to ascertain the aggregate fortune of all inhabitants living. This total is substantially less than the aggregate wealth of the country, because of the large sums held collectively by companies (in reserves), by clubs, trusts, societies and other corporations, which are either not reflected at all or else only imperfectly reflected in statements of *individual* wealth. In the separate grades, each with its separate

"multiplier" to get the total fortune in that particular grade, the system of *inter vivos* giving the distribution of capital by its owners during their lifetime, which increases with each increase in the death duties, affects the results and has to be allowed for by special adjustments. (*See* the *Colwyn Committee* on *Taxation and the National Debt* (App. xxiii.)

British Capital Estimate.—By this method the aggregate value of estates in Great Britain exceeding £5,000 in the hands of living individuals is estimated to be £11,000,000,000. This aggregate is estimated to be distributed among the living owners according to age-group and according to range of wealth as shown:

Great Britain: Estimated Classification of Capital by Reference to Value of Estate and Age of Owner
(Estates exceeding £5,000 only)

Range of Estate	£ millions								
	Age-groups								Total
	20–24	25–34	35–44	45–54	55–64	65–74	75–84	85 and over	
£ 5,000 to 10,000	21	110	257	450	418	242	96	17	1,611
10,000 to 25,000	22	95	440	614	690	414	174	32	2,481
25,000 to 50,000	60	83	240	396	461	363	132	26	1,761
50,000 to 100,000	..	48	256	349	377	285	117	25	1,457
100,000 to 250,000	..	..	315	355	384	302	154	28	1,538
250,000 to 500,000	72	26	2	237	209	165	59	9	779
500,000 to 1,000,000	5	1	105	162	154	113	38	15	593
Exceeding 1,000,000	..	..	8	236	341	117	57	21	780
Total	180	363	1,623	2,799	3,034	2,001	827	173	11,000

These figures relate mainly to the position of affairs in 1923–24.

It will be seen that, for all fortunes over £5,000 disregarding ages, the percentage distribution is as follows:

	a	b	c
5,000– 10,000	14·7	14·9	11·6
10,000– 25,000	22·6	23·8	21·0
25,000– 50,000	16·0	14·2	16·4
50,000– 100,000	13·2	13·0	13·6
100,000– 250,000	14·0	17·0	15·4
250,000– 500,000	7·1	7·7	9·7
500,000–1,000,000	5·4	4·1	5·7
1,000,000 and over	7·1	5·3	6·5
	100·0	100·0	100·0

Col. (a) gives the equivalent of the Inland Revenue table. Col. (b) gives the results of computations by Sir Josiah Stamp for 1921 for England and Wales only (*Current Problems*, p. 260). Col. (c) is derived from information furnished to the Select Committee on Increase of Wealth (War) by the Board of Inland Revenue in 1920 (App. to Report p. 236) as an estimate for wealth immediately after the war, say, at June 1919. This deals with a corpus of post-war Wealth of 13,046 million £. distributed as follows:

	£ millions	Percentage of total
Not exceeding 5,000	3,948	30·5
From 5,000– 10,000	1,054	8·0
10,000– 25,000	1,909	14·6
25,000– 50,000	1,500	11·5
50,000– 100,000	1,241	9·5
100,000– 250,000	1,400	10·8
250,000– 500,000	884	6·8
500,000– 750,000	351	2·7
750,000–1,000,000	169	1·3
Over 1,000,000	590	4·5
	13,046	100·0

Sir Josiah Stamp gave the following figures based thereon, for the total wealth of all classes (*Wealth and Taxable Capacity*):

Distribution of British Fortunes

Million £		Persons	Fortune in £
4,555		..	under 5,000
1,917	held by	169,040	to 10,000
2,202	„ „	138,460	„ 25,000
1,731	„ „	48,810	„ 50,000
1,432	„ „	20,570	„ 100,000
1,615	„ „	11,200	„ 250,000
1,020	„ „	2,971	„ 500,000
405	„ „	653	„ 750,000
195	„ „	230	„ 100,000
681	„ „	322	over 1,000,000

15,053 million £ of which 10,500 million £ is held by 302,256 persons.

"Thus we get two-thirds of the wealth held by just under 400,000 people, and the top one-third by 36,000 people. I think it is difficult to derive much *reliable* information as to whether the tendency is for individual fortunes to become increasingly great, that is for the proportion of wealth held by a fixed percentage of the whole population to become greater. The statistics have to be looked at over a considerable period, and they are affected by legal changes. The rates of mortality for the different age groups change slowly and affect the "multiplier" so that it is difficult to establish a statistical proof of a kind sufficiently rigid for so important an assertion."

It is misleading to say that "two-thirds of the wealth is held by less than 1 per cent of the population" for, as Carr Saunders and Caradog Jones say, "It takes no account of the fact that the ultimate units in society regarded in relation to wealth are families rather than persons. The equal distribution of property implies an equal holding among heads of households rather than an equal distribution among all living persons, including babies in their cradles. It gives a more just impression to take the percentage of occupied persons over 20. We then estimate that about 2½ per cent of occupied persons over 20 hold about two-thirds of the wealth, and that about 2½ in 1,000 of occupied persons over 20 hold one-third of the wealth."

Distribution of Income in Great Britain.—Dr. Bowley estimated for the United Kingdom that in 1910 all income receivers could be divided into two classes, 1·1 per cent who took 30 per cent of the whole national income and 98·9 per cent who shared the rest between them. The national income here apparently means that part of it accruing to individuals. Another division of the same total showed that 44 per cent went to only 5½ per cent of all income receivers.

Dr. Bowley's conclusions for the pre-war period were: "The broad results of this investigation are to show that the national dividend increased more rapidly than the population in the generation before the war, so that average incomes were quite one-third greater in 1913 than in 1880. The increase was gained principally before 1900, since when it barely kept pace with the diminishing value of money. The increase was shared with remarkable equality among the various economic classes. Property obtained a diminishing share of the home product, but an unchanged share of the whole income when income from abroad is included.

"The only marked alteration that has been found is the increase of the intermediate class that contains persons with small salaries, profits or earnings in other forms than wages. These include clerks and others in retail and wholesale distributive trade, and the younger or less successful persons in teaching and other professions.

"Manual labourers have been a diminishing proportion of the British population. More of the whole effort of the population has turned to direction, distribution and exchange, and relatively less to production. This has been rendered possible, it may reasonably be presumed, by the increasing services of capital to production, and probably also by the increased intelligence of labour."

British Incomes in 1801 and 1920.—Sir Josiah Stamp made a comparison over 120 years (1801 and 1920), the main conclusions of which were as follows:

Of the total number of people with incomes over £200 per annum in 1801, the £200 to £500 class were 61·5 per cent, in 1920 71·3 per cent; the £500 to £1,000 class were 21·3 per cent, in 1920 15·8 per cent; the £1,000 to £2,000 class 10·3 per cent, in 1920 7·8 per cent; the £2,000 to £5,000 class were 5·3 per cent, in 1920 3·7 per cent; the over £5,000 class were then 1·4 per cent, in 1920 1·3 per cent. In this sense there were in 1920 *relatively* fewer rich people; for each class, save the lowest, was in 1920 a smaller percentage than before. But this result is entirely due to the 1920 preponderance of the £200 to £500 class. Perhaps it was by 1920 easier to bring in these people to assessment than it used to be in 1801, and the numbers then may have been exceptionally defective. Let us assume that condition, and deal with only the total number having incomes of over £50,000 per annum. Then we get a remarkably close parallel.

The £500 to £1,000 class were	56%	in 1920	55·2%
" £1,000 " £2,000 " "	26·3%	" 1920	27·3%
" £2,000 " £5,000 " "	13·9%	" 1920	13·0%
" over £5,000 " "	3·8%	" 1920	4·5%
